## PREFACE

The twenty-fifth issue of the **NEW INTERNATIONAL YEAR BOOK** covering the year 1926 again serves as an appropriate addition to this series of annual records begun in 1898. The aim has been to provide in the most convenient and acceptable form a chronicle of the more important phases of human activity, and for this purpose there has been employed not merely a grouping by departments, but the alphabetical arrangement, a method that long since has vindicated itself as best meeting the convenience and needs of the reader or user of this work of reference. The continued publication in the United States of this **NEW INTERNATIONAL YEAR BOOK** and the increased favor that has attended its appearance, mark the development of a more general interest in international affairs, for today as never before the interrelations of nations and their peoples are of vital concern. It is essential to understand the world currents and the channels through which they flow, along with the proper background of permanent characteristics and statistics.

Passing from general considerations to the year under review, the record of 1926 naturally has its own peculiar aspect, and the first group of topics which stand out as worthy of mention are those included in the large field of international relations. The progress of the **LEAGUE OF NATIONS**, the operation of the **WORLD COURT**, the working of the **DAWES PLAN**, the application of **INTERNATIONAL ARBITRATION** in the Tacna-Arica controversy, are all matters of pressing interest. In **ALBANIA**, **MOROCCO**, and **SYRIA** were taking place political events involving the peace of Europe as well as the countries immediately concerned. In **GREAT BRITAIN** not only was there the protracted coal strike, but the short-lived general strike which so thoroughly aroused the nation. In **FRANCE** the attempt to stabilize and restore the value of the franc stood out amid the changes of ministries. In **GERMANY** the gradual return to the normal in both politics and industry was notable. In **ITALY** the great government experiment under the leadership of the extraordinary Mussolini continued notwithstanding the attempts on his life. In **RUSSIA** the Soviet Government maintained itself at home and abroad with increased activity. **CHINA** furnished a setting for further scenes in its own political drama which was beginning seriously to affect the western world.

In the **UNITED STATES** with continued prosperity the commercial and industrial record of the year as given under **FINANCIAL REVIEW** might be considered to have outweighed the political in importance. The American Republic, however, had such active foreign concerns as the settlement of the European debt payments and the maintenance of friendly relations in **MEXICO** and **NICARAGUA**. **PROHIBITION** continued to be discussed, the anthracite **COAL** strike was settled, and the **RAILWAYS** had a year of prosperity with a minimum of hostility from either the government or general public. The review of administration activities and the record of Congress as given in the article **UNITED STATES** indicate what was accomplished during the year by the executive and legislative branches of the government, of which the reduction of **TAXATION** was not the least of the achievements.

Following political history, reference appropriately might be made to the articles in the **YEAR BOOK** which discuss literature and philosophy. Not only is there the usual article on **LITERATURE**, **ENGLISH AND AMERICAN**, but **FRENCH LITERATURE**,

## PREFACE

GERMAN LITERATURE, SCANDINAVIAN LITERATURE, SPANISH LITERATURE, MODERN PHILOLOGY, CLASSICAL PHILOLOGY, and INTERNATIONAL LANGUAGE, truly reflect the international character of the work. All of these articles with their abundant and accurate bibliographies, indicate the year's advance in such a way as to arouse the interest of those wishing information about new books and their authors. There is the annual critical study of the American stage presented under THEATRE, while under MUSIC the usual record of the year is chronicled. The first International Congress of Philosophy to be held in the United States is described appropriately under PHILOSOPHY, while under PSYCHOLOGY and PSYCHICAL RESEARCH the YEAR BOOK seeks to satisfy the increasing and more general interest aroused in these subjects. Fundamental discussions and some controversies still characterized the year in the religious denominations, but there were not the spectacular outbursts that have found place in previous YEAR BOOKS. The great Eucharistic Congress of the ROMAN CATHOLIC CHURCH took place at Chicago; while other Christian Churches were building notable cathedrals and other edifices as well as increasing their activities in mission fields and elsewhere.

ARCHITECTURE always has received adequate and sympathetic attention in the YEAR BOOK, and the record for 1926 is no exception to the rule. In engineering there have been notable developments in BRIDGE design and construction, in AQUE-DUCTS, WATER WORKS, and the building of DAMS and reservoirs, the construction of TUNNELS and PORT AND HARBOR improvements, and in similar fields. In electrical engineering under RADIO TELEGRAPHY AND TELEPHONY the arrangements made for radio telephonic communications between America and England indicated further developments of wide practical use.

Under AGRICULTURE the YEAR BOOK summarizes and analyzes the progress of the year in this basic industry, devoting special attention to unusual incidents such as the record COTTON crop. In MEDICINE AND SURGERY the leading developments and items of progress are referred to and discussed succinctly, and the successes achieved in combating new and ancient maladies are described. In AËRONAUTICS the year 1926 was one of steady progress, as exemplified by the extension of commercial passenger and package routes in Europe and increased mail flying in the United States, as well as by the successful crossing of the North Pole by both dirigible and airplane. Aircraft contributed to EXPLORATION, but other work was done in the small portion of the earth's surface yet unknown. The reader can look with confidence to learning the advances made in pure science, and especially in BOTANY, GEOLOGY, MINERALOGY, and ZOÖLOGY the record is replete with interest. ANTHROPOLOGY and ARCHEOLOGY cover their usual fields; while in ASTRONOMY, CHEMISTRY, METEOROLOGY, and PHYSICS we find ever more evident the interrelations and interdependence of these sciences. Important CELEBRATIONS and EXPOSITIONS were held during the year, of which the Sesqui-Centennial at Philadelphia receives adequate treatment. In social science, CRIME and its prevention aroused great attention during 1926; while IMMIGRATION, CHILD LABOR, MARRIAGE AND DIVORCE, STRIKES AND LOCKOUTS, as well as LABOR, and LABOR LEGISLATION continued as topics of interest.

LIST OF CONTRIBUTORS

**AGRICULTURE, BOTANY, FOOD, FORESTRY, HORTICULTURE, RECLAMATION, ETC.**

EDWIN WEST ALLEN, PH.D.,  
UNITED STATES DEPARTMENT OF AGRICULTURE,  
AND  
ALFRED CHARLES TRUE, PH.D.,  
UNITED STATES DEPARTMENT OF AGRICULTURE;  
WALTER H. EVANS, PH.D. (BOTANY AND  
PLANT DISEASES); JOHN I. SCHULTE (CROP  
PRODUCTION); GEORGE HAINES (LIVE  
STOCK; DAIRYING); WALTER H. BEAL (FER-  
TILIZERS AND SOILS); SYBIL L. SMITH (FOOD  
AND NUTRITION); HOWARD L. KNIGHT  
(AGRICULTURAL LEGISLATION); JOSEPH W.  
WELLINGTON (HORTICULTURE AND FOR-  
ESTRY); RAY P. TEELE (RECLAMATION);  
AND WILLIAM A. HOOKER (ECONOMIC EN-  
TOMOLOGY; VETERINARY MEDICINE).

**ANTHROPOLOGY (WITH ETHNOLOGY)**

LESLIE SPIER, PH.D.,  
UNIVERSITY OF WASHINGTON.

**ARCHÆOLOGY**

OLIVER SAMUEL TONKS, PH.D.,  
PROFESSOR OF ART, VASSAR COLLEGE.

**ARCHITECTURE**

TALBOT F. HAMLIN,  
MEMBER OF AMERICAN INSTITUTE OF ARCHI-  
TECTS.

**ASTRONOMY; METEOROLOGY; EARTH-  
QUAKES; RELATIVITY**

EDGAR W. WOOLARD,  
UNITED STATES WEATHER BUREAU.

**BIOGRAPHY**

THE OFFICE STAFF.

**BIOGRAPHY, SPECIAL**

NEVILLE WHYMANT, PH.D., LITT.D.,  
SOMETIME ASSISTANT IN CHINESE AND JAPAN-  
ESE IN THE UNIVERSITY OF OXFORD; LECTURER  
IN THE UNIVERSITY OF LONDON; PROFESSOR OF  
ORIENTAL CLASSICS AND MYTHOLOGY, TOKYO  
UNIVERSITIES; AUTHOR OF *A Mongolian Gram-  
mar* AND OTHER WORKS.

**CHEMISTRY; EXPOSITIONS; CELEBRA-  
TIONS**

MARCUS BENJAMIN, PH.D., Sc.D., LL.D.,  
EDITOR FOR THE UNITED STATES NATIONAL  
MUSEUM.

**CIVIL ENGINEERING; AERONAUTICS**  
HERBERT TREADWELL WADE.

**DRAMA AND THEATRE**

AVERELL BROUGHTON, A.M.  
INSTRUCTOR IN ENGLISH, COLUMBIA UNIVERSITY.

**ECONOMIC, SOCIAL AND POLITICAL  
SCIENCE SUBJECTS**  
L. M. HACKER, A.M.

**EDUCATION; UNIVERSITIES**

MILO B. HILLEGAS, PH.D.,  
PROFESSOR OF EDUCATION, COLUMBIA UNIVER-  
SITY.

**ELECTRICAL ENGINEERING SUBJECTS**

REGINALD GORDON,  
FORMERLY ASSOCIATE EDITOR OF *Industrial Man-  
agement*.

**EUROPEAN HISTORY AND GAZETTEER**

IRWIN SCOFIELD GUERNSEY, A.M.,  
PROFESSOR OF AMERICAN HISTORY, DEWITT CLIN-  
TON HIGH SCHOOL, NEW YORK CITY.

**EXPLORATION; POLAR RESEARCH;  
ALASKA**

A. W. GREELY, PH.D.,  
MAJOR GENERAL, UNITED STATES ARMY, RET.;  
COMMANDER GREELY POLAR EXPEDITION.

**FINANCIAL REVIEW**

H. PARKER WILLIS,  
EDITOR, *The Journal of Commerce*, NEW YORK;  
PROFESSOR OF BANKING, COLUMBIA UNIVERSITY.

TIONAL LANGUAGE**

ALBERT SCHINZ, PH.D.,  
PROFESSOR OF FRENCH LITERATURE, SMITH  
COLLEGE.

**GEOLOGY**

DAVID HALE NEWLAND,  
FORMERLY ASSISTANT STATE GEOLOGIST OF NEW  
YORK.

**GERMAN LITERATURE**

AMELIA VON ENDE.

**INSURANCE**

WILLIAM S. CRAWFORD,  
INSURANCE EDITOR, *The Journal of Commerce*,  
NEW YORK.

**ARBITRATION; DISARMAMENT; IN-  
TERNATIONAL LAW; LEAGUE OF NA-  
TIONS; WORLD COURT; PEACE MOVE-  
MENTS; ETC.**

CLINTON ROGERS WOODRUFF, LL.D.,  
HONORARY SECRETARY OF THE NATIONAL MU-  
NICIPAL LEAGUE AND MEMBER OF THE MOHONK  
CONFERENCE; FORMERLY PRESIDENT OF THE  
BOARD OF PERSONAL REGISTRATION, PHILADEL-  
PHIA.

**LABOR LEGISLATION**

JOHN B. ANDREWS, PH.D.,  
SECRETARY OF THE AMERICAN ASSOCIATION FOR  
LABOR LEGISLATION AND EDITOR OF *American  
Labor Legislation Review*.

**LITERATURE, ENGLISH AND AMERICAN**

WILLIAM BENFIELD PRESSEY, A.M.,  
ASSISTANT PROFESSOR OF ENGLISH, DARTMOUTH  
COLLEGE.

**MEDICAL SUBJECTS**

EDWARD PREBLE, M.D.

**METALLURGY**

EDWARD HODGES ROBIE,  
ASSOCIATE EDITOR OF *Engineering and Mining  
Journal-Press*.

EDITORIAL STAFF, *America*.

**SANITARY ENGINEERING AND MU-  
NICIPAL SUBJECTS**

MOSES NELSON BAKER, PH.D., C.E.,  
ASSOCIATE EDITOR OF THE *Engineering News-  
Record*.

**SCANDINAVIAN LITERATURE**

HARRY V. E. PALMBLAD, PH.D.,  
PROFESSOR OF GERMAN AND FRENCH, PHILLIPS  
UNIVERSITY.

**SPANISH LITERATURE**

JOHN D. FITZ-GERALD, PH.D., LITT.D.,  
PROFESSOR OF SPANISH, UNIVERSITY OF ILLI-  
NOIS; MEMBER OF THE HISPANIC SOCIETY  
OF AMERICA; CORRESPONDING MEMBER OF THE  
SPANISH ROYAL ACADEMY, AND OF THE ROYAL  
ACADEMY OF HISTORY OF MADRID.

**SPORTS**

CHARLES A. TAYLOR,  
SPORTING DEPARTMENT, *New York American*.

**UNITED STATES AND STATE ARTICLES**

PHILIP COAN,  
EDITORIAL STAFF, *The Brooklyn Daily Eagle*;  
FORMER EDITOR OF THE *New York Sun*.

**ZOOLOGY AND EVOLUTION**

AARON L. TREADWELL, PH.D.,  
DEPARTMENT OF ZOOLOGY, VASSAR COLLEGE.

## ILLUSTRATIONS

	FACING PAGE
AERONAUTICS: The Dirigible Norge Leaving King's Bay on its Polar Expedition, and the Aviators of the North Pole Airplane Expedition . . .	14
ARCHITECTURE: Riverside Church, New York City . . . . .	58
ARCHITECTURE: Barclay-Vesey Building of the New York Telephone Company . . . . .	60
ASTRONOMY: Triangulum, Spiral Nebula, and Sagittarius, Distant Star Cloud . . . . .	72
BRIDGES: The Proposed Hudson River Suspension Bridge . . . . .	112
EXPOSITIONS: The Sesqui-Centennial Exposition at Philadelphia—Liberty Bell at the Entrance to the Grounds, and the Avenue of the Colonies . . .	252
FRANCE: President Doumergue with the Cabinet Formed by Premier Poincaré . . . . .	290
GREAT BRITAIN: Members of the British Imperial Conference . . . . .	330
FOUR EUROPEAN LEADERS OF 1926—General Primo de Rivera, Benito Mussolini, Mustapha Kemal, and Marshal Joseph Pilsudski . . . . .	394
LITERATURE: Four Authors of 1926—Ellen Glasgow, Elinor Wylie, John Erskine, and Will Durant . . . . .	436
NECROLOGY: Four Prominent Men who Died in 1926—Oscar S. Straus, Charles William Eliot, Cardinal Mercier, and James K. Hackett . . .	516
PAINTING AND SCULPTURE: Artists who Died in 1926—George Inness, Jr., and Joseph Pennell . . . . .	568
PROHIBITION: The Schooner "Consuelo II" captured by the United States Coast Guard at Anchor in New York Harbor with the Coast Guard Cutter "Perry" . . . . .	620
RAILWAYS: The United States Railway Mediation Board of 1926 . . . . .	638
THEATRE: "Craig's Wife," the Pulitzer Prize Play of 1926—Scene from Act I . . . . .	722
UNITED STATES: Four United States Senators Prominent in 1926—Arthur R. Gould of Maine, Gerald P. Nye of North Dakota, Thomas D. Schall of Minnesota, and Daniel E. Steck of Iowa . . . . .	746

## KEY TO PRONUNCIATION

<b>a</b>	as in ale, fate. Also see <b>ē</b> , below.	<b>d</b>	as in the Spanish Almodovar, pulgada, where it is nearly like <i>th</i> in English then, this.
<b>ā</b>	" " senate, chaotic.	<b>g</b>	" " go, get.
<b>ā</b>	" " glare, care, and as <i>e</i> in there. See <b>ē</b> , below.	<b>g</b>	" " the German Landtag, and <i>ch</i> in Feuerbach, buch; where it is a guttural sound made with the back part of the tongue raised toward the soft palate, as in the sound made in clearing the throat.
<b>ā</b>	" " am, at.	<b>h</b>	" <i>j</i> in the Spanish Jijona, <i>g</i> in the Spanish gila; where it is a fricative somewhat resembling the sound of <i>h</i> in English hue or <i>y</i> in yet, but stronger.
<b>ā</b>	" " arm, father.	<b>hw</b>	" <i>wh</i> in which.
<b>ā</b>	" " ant, and final <i>a</i> in America, armada, etc. In rapid speech this vowel readily becomes more or less obscured and like the neutral vowel or a short <i>u</i> ( <b>ū</b> ).	<b>k</b>	" <i>ch</i> in the German ich, Albrecht, and <i>g</i> in the German Arensburg, Mecklenburg; where it is a fricative sound made between the tongue and the hard palate toward which the tongue is raised. It resembles the sound of <i>h</i> in hue, or <i>y</i> in yet; or the sound made by beginning to pronounce a <i>k</i> , but not completing the stoppage of the breath. The character <i>k</i> is also used to indicate the rough aspirates or fricatives of some of the Oriental languages, as of <i>kh</i> in the word Khan.
<b>α</b>	" " final, regal, where it is of a neutral or obscure quality.	<b>n</b>	" " in sinker, longer.
<b>a</b>	" " all, fall.	<b>ng</b>	" " sing, long.
<b>ē</b>	" " eve.	<b>n</b>	" " the French bon, Bourbon, and <i>m</i> in the French Étampes; where it is equivalent to a nasalizing of the preceding vowel. This effect is approximately produced by attempting to pronounce "onion" without touching the tip of the tongue to the roof of the mouth. The corresponding nasal of Portuguese is also indicated by <i>n</i> , as in the case of São Antão.
<b>ē</b>	" " elate, evade.	<b>sh</b>	" " shine, shut.
<b>ē</b>	" " end, pet. The characters <b>ē</b> , <b>ā</b> , and <b>ā</b> are used for <b>ā</b> , <b>ae</b> in German, as in Baedeker, Gräfe, Händel, to the values of which they are the nearest English vowel sounds. The sound of Swedish <b>ā</b> is also sometimes indicated by <b>ē</b> , sometimes by <b>ā</b> or <b>ā</b> .	<b>th</b>	" " thrust, thin.
<b>ē</b>	" " fern, her, and as <i>i</i> in sir. Also for <b>ē</b> , <b>oe</b> , in German, as in Göthe, Goethe, Ortel, Oertel, and for <b>eu</b> and <b>œu</b> in French, as in Neufchâtel, Crèveceur; to which it is the nearest English vowel sound.	<b>th</b>	" " then, this.
<b>e</b>	" " agency, judgment, where it is of a neutral or obscure quality.	<b>zh</b>	" <i>z</i> in azure, and <i>s</i> in pleasure.
<b>i</b>	" " ice, quiet.	An apostrophe [ <i>l</i> ] is sometimes used to denote a glide or neutral connecting vowel, as in tā'b'l (table), kāz'm (chasm).	
<b>i</b>	" " quiescent.	Otherwise than as noted above, the letters used in the respellings for pronunciation are to receive their ordinary English sounds.	
<b>i</b>	" " ill, fit.	When the pronunciation is sufficiently shown by indicating the accented syllables, this is done without respelling; as in the case of very common English words, and words which are so spelled as to insure their correct pronunciation if they are correctly accented. Pronunciation is discussed in the NEW INTERNATIONAL ENCYCLOPEDIA.	
<b>ō</b>	" " old, sober.		
<b>ō</b>	" " obey, sobriety.		
<b>ō</b>	" " orb, nor.		
<b>ō</b>	" " odd, forest, not.		
<b>o</b>	" " atom, carol, where it has a neutral or obscure quality.		
<b>oi</b>	" " oil, boil, and for <b>eu</b> in German, as in Feuerbach.		
<b>ou</b>	" " food, fool, and as <i>u</i> in rude, rule.		
<b>ou</b>	" " house, mouse.		
<b>ū</b>	" " use, mule.		
<b>ū</b>	" " unite.		
<b>ū</b>	" " cut, but.		
<b>ū</b>	" " full, put, or as <i>oo</i> in foot, book. Also for <b>ū</b> in German, as in München, Müller, and <i>u</i> in French, as in Buchez, Budé; to which it is the nearest English vowel sound.		
<b>ū</b>	" " urn, burn.		
<b>y</b>	" " yet, yield.		
<b>z</b>	" " the Spanish Habana, Córdoba, where it is like a <i>v</i> made with the lips alone, instead of with the teeth and lips.		
<b>ch</b>	" chair, cheese.		

# THE NEW INTERNATIONAL YEAR BOOK

**ABBOTT, EDWIN.** English author and teacher, died in London, England, October 13, after a protracted illness. He was born in London, Dec. 20, 1838, the son of Edwin Abbott, headmaster of the Philological School in London, and was educated at the City of London School and St. John's College, Cambridge University, where he took honors and became a fellow in 1862. He was assistant master of King Edward's School, Birmingham, from 1862-64, of Clifton College in 1865, and headmaster of City of London School with which he was actively identified until 1889. He was eminent not only as a literary scholar, critic, and teacher, but also as a preacher. He was Hulsean Lecturer at Cambridge in 1876 and select preacher at Oxford in 1877. He was a student of Bacon and Shakespeare and in 1870 published the first edition of his *Shakespearian Grammar*, which was followed in the next year by *English Lessons for English People* in which his friend Prof. J. R. Seeley coöperated. He also prepared an excellent guide for teachers of the Bible called *Bible Lessons*, and in 1876 he produced the fullest and best edition of Bacon's *Essays* yet published. This volume developed an interesting controversy, one result of which was Abbott's *Francis Bacon, an Account of His Life and Works*, published in 1885. His *Through Nature to Christ, or Through the Illusion to the Truth*, published in 1877 evoked hostile criticism for its liberal attitude to theology. A number of important religious books followed of which *Onesimus* in 1882, and *Silanus the Christian* in 1906 showed historical imagination coupled with broad scholarship. In 1884 with W. G. Rushbrooke he produced the *Common Tradition of the Synoptic Gospels*, and in 1886 an interesting work known as *The Kernel and the Husk* dedicated "To the Doubters of this Generation and the Believers of the Next," a series of letters to a young friend treating the difficulties presented to a would-be believer by the miraculous elements in the Bible story. After leaving the City of London School he published *Philomythus* (1891); *Anglican Career of Cardinal Newman* (1892); *St. Thomas of Canterbury, His Death and Miracles* (1898); and a vast number of theological works. *The Fourfold Gospel*, and the *Founding of a New Kingdom* (1917).

**AB'YSSIN'IA.** A country in West Africa between the Anglo-Egyptian Sudan and the Red Sea comprising the provinces of Harar,

Equatorial Provinces, Gondar, Jimma, Wollo, Shoa, Sellale, Edjow, Wollaga, Guimira, Gojan, etc. The area has been variously estimated at from 350,000 to 430,000 square miles. The former figure is probably the more accurate. The most recent estimate of the population places it at about 10,000,000, although the Abyssinians, properly so called, number less than 3,500,000. They are Christians of Hamitic origin. The capital is Addis Abeba, with a population of from 60,000 to 70,000, of whom about 1000 are foreigners. The other chief city, Harar, has a population of about 40,000. Domestic slavery is a recognized institution, but slave trading, by an ancient law renewed by a decree issued in June, 1923, is punishable by death. In March, 1924, an edict was issued by Ras Tafari, providing for the gradual emancipation of slaves, beginning with the children born of slaves.

The backward methods of agriculture and the lack of adequate means of transportation have continued to retard economic development. The chief pursuits are agriculture and stock raising. The system of land holding is feudal and the soil theoretically belongs to the Negus or Emperor. The products include cotton, sugar cane, the date palm, coffee, and grapes, but with the exception of coffee, they are nowhere extensively raised. The production of the so-called Harari coffee is increasing from year to year. There is a wild coffee plant which is found especially in southern and western Abyssinia bearing a berry known as Abyssinian coffee of which the supply is said to be unlimited. Among the other native products are hides and skins, millet, wheat, barley, and tobacco, and there are valuable forests including rubber. In some districts iron is found and is used in the manufacture of native weapons. In the western districts the mining of gold has been carried on, and coal, copper, and sulphur are also found.

No reliable figures for exports and imports are available, but according to a British authority, they reach £2,500,000 annually. The chief exports are hides and skins, coffee, wax, ivory, civet, and native butter; and the chief imports, cotton shirting, cotton goods, liquors, railway materials, provisions, sugar, and petroleum. The principal line of trade is along the French-Ethiopian railway, but there is a considerable caravan trade in the interior. The imports came mainly from the United States, Great Britain, France, India, Italy and Japan. Trade with Great Britain in 1925 was: Imports

from Abyssinia, £119,057; exports to Abyssinia, £21,831.

The French-Ethiopian railway connects Djibuti in French Somaliland with Addis Abeba, a distance of about 495 miles. The line is of meter gauge. Trains run twice weekly covering the distance in three days. There are about 2000 miles of telegraph line and a few miles of telephone connection. In 1926 the Empress was still Waizeru Zauditu, daughter of the late Emperor Menelik. She was named Empress after the deposition of Lij Yasu in 1916; but the actual authority vests in Ras Tafari, great-nephew of Menelik, who had been proclaimed heir to the throne and who acts as Regent. In August, 1919, a modified form of cabinet government was introduced, but its powers are rather shadowy. On Sept. 28, 1923, Abyssinia was admitted into the League of Nations.

**HISTORY.** During the summer and fall of 1926 there was considerable discussion in the press concerning the economic aims of Great Britain and Italy in Abyssinia. A text of the notes that passed between the two countries with regard to concessions that were to be asked of Abyssinia was published in the summer. Italy has always had an interest in Abyssinia, although she has been rather chary of pressing her claims after the disastrous defeat she suffered in the Italian-Abyssinian War of 1896. In recent years Italy has had a strong desire to connect her two colonies of Eritrea and Italian Somaliland with rail communication. Great Britain has supported her in this desire and Italy, in turn, agreed to support her in an attempt to gain the concession from Abyssinia of the rights in Lake Tsana, the headwater of the Blue Nile. Great Britain wished to construct a dam to impound water for irrigation purposes in the Sudan. Italy sought as well an exclusive economic interest in the west of Ethiopia, and in the whole of the territory to be crossed by the above mentioned railroad.

France, which was a signer of the agreement of 1906 with Italy and Great Britain concerning the spheres of influence in Africa, showed no outward interest in the move of Italy and Great Britain, although under the terms of the 1906 arrangement she would have to be consulted. Abyssinia protested to the League of Nations, on the ground that the proposed agreement would seriously impair her sovereignty which was recognized when she was admitted to membership in the League. Her note to the League ended by stating "Throughout our history we have seldom met foreigners who did not desire to possess themselves of Abyssinian territory and destroy our independence."

In commenting upon the subject in Parliament, Sir Austen Chamberlain stated on August 2, that Great Britain had an agreement with the late Emperor Menelik giving her (Great Britain) preference when the time came to deal with the Lake Tsana question. Negotiations with Ras Tafari had failed to produce any results, although the question became more and more pressing. Consequently he communicated with France and Italy with the above mentioned result. The agreement with Italy had no political significance and was merely an arrangement to prevent competition between the two countries. He concluded by saying that there was absolutely no question of national sovereignty involved.

On August 14, the Italian government sent a

note to the League stating that no attack was being made on Abyssinia's sovereignty and that the measures suggested would be of material economic and industrial benefit to Abyssinia. The complaint of Abyssinia was not presented to the assembly of the League. The press reported that a settlement had been reached whereby the concessions were granted in return for a loan.

During the year an expedition sponsored by the Field Museum, the Chicago *Daily News* and the North American Newspaper Alliance was exploring in Abyssinia.

**ACADEMY, FRENCH** (ACADÉMIE FRANÇAISE). The oldest of the five academies which make up the Institute of France, and officially considered the highest; founded in 1635, reorganized in 1816. The list of the Immortals at the beginning of 1926 was as follows: Paul Bourget; Gabriel Hanotaux; Henri Lavedan; René Bazin; Maurice Donnay; Jean Richepin; Raymond Poincaré; Eugène Brieux; R. Doumic; Marcel Prévost; Henri de Régner; Maréchal Lyautey; H. R. D. Cochin; Pierre de la Gorce; Henri Bergson; Maréchal Joffre; Louis Barthou; Monsignor Baudrillard; René Boylesve-Tardieu; François de Curel; Jules Cambon; Georges Clemenceau; Maréchal Foch; H. Bordeaux; Robert de Flers; Joseph Bédier; André Chevrillon; Pierre de Nolhac; Georges Goyau; Georges de Porto-Riche; Edouard Estaunié; Maître Henri Robert; Charles Jonnart; Abbé Bremond; Georges Lecomte; Emil Picard; Albert Besnard; Paul Valéry; Auguste Armand Ghislain Marie Joseph Nomphe de Caumont; Duke de la Force; and Louis Bertrand.

See FRENCH LITERATURE.

**ACADEMY OF ARTS AND LETTERS, AMERICAN.** A society founded in 1904 by members of the National Institute of Arts and Letters, and incorporated and given a charter by Act of Congress approved April 17, 1916. The purposes of the organization are the furtherance of the interests of literature and the fine arts. The membership is limited to 50 chairs, similar to that of the French Academy, and vacancies caused by death are filled by election by the members from the National Institute on the basis of lifetime achievement in literature, painting, sculpture, architecture, and music. There were two vacancies in 1926, caused by the deaths of Joseph Pennell, died April 23, and Stuart Sherman, died August 21. On April 23, at an adjourned annual meeting, Edwin Anderson Alderman and Edward Channing were elected to membership. At the annual meeting on November 11 there were two more elections to membership, Wilbur L. Cross and Hermon A. MacNeil. In addition to the four named, the membership in 1926 constituted the following, in order of election: Daniel Chester French; James Ford Rhodes; William Milligan Sloane; Robert Underwood Johnson; Henry van Dyke; William Crary Brownell; Arthur Tving Hadley; Edwin Howland Blashfield; Thomas Hastings; Brander Matthews; George Edward Woodberry; George Whitefield Chadwick; George de Forest Brush; William Rutherford Mead; Bliss Perry; Abbott Lawrence Lowell; Nicholas Murray Butler; Owen Wister; Herbert Adams; Augustus Thomas; Timothy Cole; Cass Gilbert; Robert Grant; Frederick MacMonnies; William Gillette; Paul Elmer More; Gari Melchers; Elihu Root; Brand Whitlock; Hamlin Garland; Paul Shorey; Charles Adams Platt;

Archer Milton Huntington; Childe Hassam; David Jayne Hill; Lorado Taft; Booth Tarkington; Charles Dana Gibson; John Charles Van Dyke; Royal Cortissoz; Albert J. Beveridge; Henry Hadley; Charles Downer Hazen; and George Pierce Baker.

At a public meeting held on April 23, 1926, the Academy presented to Miss Cecilia Beaux its gold medal for painting and to Mrs. Mary E. Wilkins Freeman the Howells gold medal for fiction. These medals had been awarded at the annual meeting in November, 1925. At this time also, there was unveiled a bronze bas-relief of William Dean Howells sculptured by Miss Brenda Putnam and presented to the Academy by one of its members.

The Directors of the Academy in 1926 were: President, William Milligan Sloane; Chancellor, Nicholas Murray Butler; Secretary, Robert Underwood Johnson; Treasurer, Thomas Hastings; Hamlin Garland, Cass Gilbert, Archer Milton Huntington, Brander Matthews, and Augustus Thomas. The Academy has headquarters in its building at 633 West 155th Street, New York.

**ACCIDENTS.** See RAILWAY ACCIDENTS; SAFETY AT SEA.

**ADAMI, JOHN GEORGE.** British pathologist and former Professor of Pathology in McGill University at Montreal, Canada, died August 29. He was born at Manchester, England, Jan. 12, 1862, and was educated at the Owens College, Manchester and at Christ's College, Cambridge, where he received honors in science. After studying at the Universities of Breslau and Paris he became house physician at the Manchester Royal Infirmary and demonstrator of pathology at the University of Cambridge in 1887. He was John Lucas Walker Student of Pathology in 1890, and fellow of Jesus College in 1891. In 1892 he became Strathcona Professor of Pathology and Bacteriology at McGill University, Montreal, Canada, serving also as advisory pathologist to the Montreal General and Royal Victoria Hospitals. In 1919 Dr. Adami was chosen Vice-Chancellor of the University of Liverpool, a position he occupied at the time of his death. He served as president of the Association of American Physicians, 1911-12, and of the Canadian Association for the Prevention of Tuberculosis, 1909-12. He was also president of the Montreal City Improvement League, 1909-16, and of the Montreal Child Welfare Exhibition in 1912. He was connected with the Canadian Expeditionary Force as medical historical recorder with the rank of colonel in the Canadian Army Medical Corps. In 1919 he was made Commander of the Order of the British Empire. He received the degrees of M.D. (honorary) from Belfast University in 1921; LL.D. from the University of New Brunswick in 1900; and from the University of Toronto in 1912. He was a fellow of the Royal Society, of the Royal College of Physicians of London, the Royal College of Surgeons in England, and of other societies in Great Britain and Canada. He wrote a number of authoritative works and papers of which the most significant were: *The Principles of Pathology* (1908); *Medical Contributions to the Study of Evolution* (1918); *Charles White of Manchester, and the Prevention of Puerperal Fever* (1922).

**ADELBERT COLLEGE.** See WESTERN RESERVE UNIVERSITY.

**ADELPHI COLLEGE.** A non-sectarian college of arts and sciences for women, at Brooklyn, N. Y.; incorporated in 1896. In the autumn of 1926 there were 540 students in the regular courses leading to the B.A. degree, distributed as follows: seniors, 108; juniors, 135; sophomores, 148; freshmen, 149. There were also 90 others in extension courses. The summer school registration was 104. The faculty numbered 36, three additions having been made, as follows: an instructor in English, an assistant in mathematics, and an assistant in biology. The income for the year was \$153,096.88. The library contained 18,339 volumes. President, Frank Dickinson Blodgett, A.M., LL.D.

**ADEN, id'en or a'den.** A volcanic peninsula on the Arabian coast belonging to Great Britain; about 100 miles east of Bab-el-Mandeb. Area, 75 square miles: including the protectorate, about 9000 square miles. The settlement comprises also the peninsula of Little Aden, and some villages on the mainland, and the island of Perim, the last named having an area of 5 square miles. In 1921 the population of Aden and Perim was 54,923, of whom 80 per cent were Mohammedans. The population of the protectorate was about 100,000. The manufactures, which are unimportant, consist chiefly of salt and cigarettes.

Aden is the principal commercial centre of the Arabian peninsula and the entrepôt for the Red Sea markets of Abyssinia, Eritrea, and Somaliland. During the year the number of ships using the port steadily increased. Its importance as a fueling station can scarcely be shaken, owing to its position halfway between Europe and the Orient and to its low prices for fuel, oil being imported free of duty and coal obtained cheaply from South Africa. The imports for the 1925-26 period amounted to \$32,032,000 and the exports to \$26,756,000. A large amount of this commerce represents transhipped goods. The chief imports are cotton piece goods, grain, coal, coffee, sugar, hides and skins, tobacco, fruit, vegetables, and other provisions; and among the chief exports, coffee, gums, hides and skins, cotton goods, tobacco, grain, sugar, and provisions. In 1924-25, 1315 merchant vessels of 4,255,233 tons entered the port of Aden; 698 of these were British.

Attached to Aden are the Kuria Muria islands off the Arabian coast, five in number, ceded by the Sultan of Muskat. Aden is under a British political resident with four assistants, the British Colonial Office having charge of all political questions and the British War Office of military questions. Political resident and general officer commanding in 1926, Maj.-Gen. J. H. K. Stewart.

**ADLER, Ad'ler, JACOB P.** Yiddish actor, died in New York, March 31. He was born on Jan. 1, 1855, at Odessa, Russia, and was to all appearances the usual Jewish boy destined to perform the same rôles as his neighbors. His life was uneventful until a Jewish troupe from Roumania came to Odessa in 1875, and by their spirited representation of Jewish psychology fired young Adler to imitate them. From this time he determined to devote all his energies to becoming an actor that he might put before others the innermost feelings of his people. His first appearance was at Kherson, Russia, and from the outset he was hailed as

a skillful interpreter of the sentiment of the Russian Ghetto. This was in 1878 and he never looked back. So eloquent were his presentations and so telling his gibes at the overlords that he contributed, in no small measure, to the putting into effect, in 1883, of the Russian Government's prohibition of all Jewish. Finding his living gone and his very idealism threatened, Adler emigrated to London in 1883 and stayed there nearly five years. He removed to New York in February, 1888, and became almost instantly one of the leading actors of the American Yiddish Jewish stage.

**ADULT EDUCATION, AMERICAN ASSOCIATION FOR.** An organization formed in 1926 to serve as a clearing house of adult education activities, to help those already working in this field, and to advise others how to start. The formation of this association followed two years of preparatory work, which included a series of conferences of educators in different parts of the country and a survey of existing efforts in adult education conducted by the Carnegie Corporation of New York. These preliminary investigations showed that more than 3,000,000 men and women in the United States, more than in all the colleges and universities combined, were pursuing some kind of education after working hours, either by correspondence, under public library guidance, or in university extension classes, workers' classes, folk schools, institutes or museum classes, and that in such institutions a new theory and practice of education is being worked out, with its own problems, methods, and literature.

Certain means of accomplishing the Association's object were planned: the collection of a central reference library for professional workers in the field; services to be offered to existing national organizations in the field; the formation of additional organizations, if and when the need should arise; a publication programme, to begin with occasional bulletins, with possible enlargement later into a quarterly or monthly periodical; affiliation with similar associations in Europe; maintaining teacher-training courses in adult education.

One significant step had already been taken by the end of the year, namely the opening of the following four teacher-training courses at the New School for Social Research, New York City: "Fundamental problems in adult education," by Everett Dean Martin, director of the People's Institute; "Method and content of adult education," by E. C. Lindeman; "A practice course in adult education," by Harry A. Overstreet; "Educational psychology," by Leta S. Hollingsworth. Publication of a series of studies on adult education made under the auspices of the Carnegie Corporation of New York had begun. Five volumes issued were: *Libraries and Adult Education*, American Library Association; *New Schools for Older Students*, Nathaniel Peffer; *Educational Opportunities for Young Workers*, Owen D. Evans; *The University Afield*, Alfred L. Hall-Quest; *Correspondence Schools, Lyceums, Chautauques*, John S. Noffsinger.

Membership in the Association is open to individuals or groups interested in adult education. It depends for its financial support upon dues from members, and upon the interest of private individuals and of educational foundations. The officers of the Association in 1926

were: President, Dean James E. Russell, of Teachers College, Columbia University; vice-president, Prof. Leon J. Richardson, University of California; treasurer, J. H. Puelicher, American Bankers' Association, Milwaukee; secretary, Miss Margaret Burton, National Board of the Young Women's Christian Association, New York; executive director, Morse A. Cartwright, New York. The foregoing with fourteen other members composed the executive board of the association. National headquarters, which were opened formally Oct. 18, 1926, are at 41 East 42d Street, New York City. See also EDUCATION IN THE UNITED STATES.

**ADVANCEMENT OF SCIENCE, AMERICAN ASSOCIATION FOR THE.** Founded in 1848 to advance science, to give a stronger and more general impulse and more systematic direction to scientific research, and to procure for the labors of scientific men increased facilities and a wider usefulness. In 1926 its membership included over 14,000 individuals interested in the advancement of science and the progress of knowledge and education, 112 autonomous and independent associated scientific societies of which 81 were officially affiliated with the Association, and 21 local academies of science and learning. The direction of the association rests in a council consisting of the officers, representatives of the affiliated societies and academies, and eight members elected at large by the council. It holds an annual meeting at the same time as the association and operates in the interim through an executive committee. The activities of the association are of three kinds: Those related to the holding of the annual and other meetings; those related to publications; and those related to the advance of knowledge by research. It has 15 sections representing the main current subdivisions of science, as follows: Mathematics, physics, chemistry, astronomy, psychology, social and economic sciences, historical and philological sciences, anthropology, geology, zoological sciences, botanical sciences, engineering, medical science, agriculture, and education.

The official organ of the association is a weekly journal, *Science*, which furnishes an open forum for the discussion of questions regarding science and education, almost every branch of scientific knowledge being represented in its columns. In addition the association issues an elaborate programme for the annual meeting. The permanent endowment of the Association, the income from which is employed to advance scientific research, amounted in 1926 to \$140,876.66; grants are made annually to individuals or scientific organizations to promote research. Two regional divisions are conducted by the Association: The Pacific Division, including the Pacific States, Alaska, the Philippines, and the Hawaiian Islands, and the Southwestern Division, including Arizona, New Mexico, Colorado, western Texas, and northern Mexico. These divisions are autonomous, holding annual and other meetings and engaging in other projects in their respective fields.

The eighty-third meeting of the Association convened in Philadelphia, December 27, 1926, to Jan. 1, 1927, with an attendance of about 3200, this being one of the larger meetings. Forty-three associated societies met with the Association and 222 sessions were held, at which 1449 papers and addresses were read. The science exhibition was well developed, with exhibits by

commercial firms as well as by individual research workers and research institutions and laboratories. The retiring president, Dr. Michael I. Pupin of Columbia University, delivered the annual presidential address, speaking on "Progress in Electrical Communication during the Last Fifty Years." Dr. Liberty Hyde Bailey of Cornell University, the botanist and horticulturist was president of the Association at this meeting. Previously a summer session of the Association had been held at Oakland, Calif., in conjunction with the Pacific Division, June 16-18.

The annual Association prize of \$1000 was awarded to Dr. George D. Birkhoff of Harvard University for his outstanding contribution to our knowledge of the mathematical relations of physical theory. The standing committee of the Association on the place of the sciences in education, with Dr. Otis W. Caldwell of Columbia University as chairman, was making a survey of this subject. There was also a committee of 100 on general scientific research, the secretary of which was Dr. Rodney H. True of the University of Pennsylvania. The permanent secretary of the Association is Dr. Burton E. Livingston of Johns Hopkins University, from whom information regarding the organization may be secured by addressing him at the headquarters of the Association, Smithsonian Institution Building, Washington, D. C. The president of the Association elected for 1927 was Arthur A. Noyes, director of the Gates Chemical Laboratory, California Institute of Technology. The 1927 meeting was to be held December 26 to 31 at Nashville, Tenn.

**ADVANCEMENT OF SCIENCE, ASSOCIATIONS FOR.** The American Association for the Advancement of Science (q.v.) held its 1926 meeting in Philadelphia, Pa., Dec. 27, 1926 to Jan. 1, 1927. A summer session was also held at Oakland, Calif., in connection with the Pacific Division, June 16-18. The British Association for the Advancement of Science (q.v.) met at Oxford August 4-11. The Indian Scientific Congress met at Bombay in January; the Australian Association for the Advancement of Science met at Perth, West Australia, August 23-28; the French Association for the Advancement of Science at Lyons, July 26-31; and the German Association of Scientists and Physicians at Dusseldorf, September 19-26.

**ADVENT CHRISTIANS.** See ADVENTISTS.

**ADVENTISTS.** The Advent movement had its origin with William Miller, who believed not only in the coming of Christ in person, power, and glory, but that such an advent was at hand and that the date might be fixed with some definiteness. The first general gathering of those interested took place in Boston, October, 1840, the movement at that time being wholly within the existing churches, but in April, 1845, a conference was held at Albany, N. Y., at which the adherents of the Adventist doctrine were organized and a declaration of principles was adopted, embodying the views of Mr. Miller. For the next ten years this organization included practically all the Adventists, but gradually separate bodies developed, beginning with the Adventist Christian Church, in 1855, and including the Seventh-Day Adventists, organized in 1860; Life and Advent Union, in 1864; The Church of God (Adventists), in 1866; and The Churches of God and Christ Jesus, in 1888.

**ADVENT CHRISTIAN CHURCH.** This church,

which is congregational in church government, holds simply to the idea of the imminence of Christ's return but takes the position that the day cannot be determined. It holds a biennial general conference, that of 1926 having been held in June, at Alton Bay, N. H. Statistics of 1925, covering 46 conferences, showed 537 churches; 528 ordained ministers; 137 licensed ministers; 28,297 church members; 289 Sunday schools; 15,435 Sunday school members; 138 local societies, with 4758 members. Sixteen conferences are not included in these totals. The denomination maintains four publication societies and two educational institutions, Aurora College at Aurora, Ill., and the New England School of Theology in Boston. Periodicals published include the *World's Crisis* (Boston), *Messiah's Advocate* (Oakland), *Our Hope* (Mendota, Ill.), and *Present Truth Messenger* (Live Oak, Fla.). Among the philanthropic institutions of the denomination are The American Advent Christian Home and Orphanage at Dowling Park, Fla., and the Vernon Home for ministers and missionaries at South Vernon, Mass. The Reverend George A. Osman was general director in charge of the headquarters at 160 Warren Street, Boston 19, Mass.

**SEVENTH-DAY ADVENTISTS.** In 1925 this was the largest denomination of the Adventist group and embraced 12 union conferences in the United States and Canada. This denomination believes that the seventh day of the week from sunset on Friday to sunset on Saturday is the Sabbath established by God's law and that immersion is the only proper form of baptism. The local church is congregational in government, though under the general supervision of the conference. The statistical report of the denomination for 1925 indicated 2239 churches in the North American Division, 836 ordained ministers, and 108,802 church members. Sabbath schools numbered 2712 and the membership 116,238. Figures for the foreign divisions were: 3390 churches, 837 ordained ministers, 142,186 church members, 5245 Sabbath schools, with an enrollment of 171,514. The movement maintained in the United States and Canada 68 educational institutions, which in 1925 had 11,933 students enrolled. Of the colleges and seminaries, Loma Linda Medical College, Calif., and Pacific Union College, St. Helena, Calif., were the largest. There were also 80 educational institutions maintained in foreign countries. The denomination had 18 publishing houses in North America, and 35 in foreign countries. Denominational literature was issued in 128 languages. Evangelistic work was conducted in 124 countries. Periodicals of the movement include: *Advent Review and Sabbath Herald* (Washington); *Signs of the Times* (Mountain View, Calif.); and *Watchman* (Nashville, Tenn.).

**AERONAUTICS.** It was generally admitted that the year 1926 was one of the most significant in the history of aeronautical development for the indications were clearer than ever before that aviation and especially transport aviation, had reached a commercial status, with a promise of future usefulness far greater than ever previously had been realized. In Europe, by liberal subsidies, there had been an increase of air routes, and of extensively advertised and used passenger transportation facilities, along with mail carrying. This had led to the improvement of machines and increase in capacity and

engine performance. In America, on the other hand, with aviation unsubsidized, the transportation of mail was the most prominent feature, but along with it was a large amount of civil flying, which was said to be, in the aggregate, far greater than that done in Europe although the fact was not always recognized either in Europe or in the United States. The transfer of the carrying of the air mail from the United States Government to private operators, decided upon during the year, was an important event with a distinct bearing on the future development of air transport.

Furthermore, in the United States the passage of legislation putting aviation under Federal supervision and the passage of the Army and Navy air bills providing for the regular development of aircraft in these services indicated that the Government was seriously engaged in the furthering of the aircraft industry and air travel in general and also sought to protect the people from the various conditions that had arisen or were likely to arise, where government supervision was essential.

In 1926 it was becoming evident that moneyed interests in the United States were ready to invest capital in air transportation and substantial companies were organized for that purpose and were anxious to compete for carrying mail and freight. In November for example, a contract was signed between an air transportation company, special arrangements being concluded in one case between the National Transport Company, Inc., and the American Express Co. for the rapid conveyance of express packages by airplane between New York and Chicago and Chicago and Dallas, Tex., saving one full day en route. The express company was to pick up and deliver the packages at the respective ends of the trip, while the plane transport company would do the actual carrying.

All of this tended to stimulate the progress of design, and in the United States in particular, it was felt that new commercial planes were being evolved independent of military models. Furthermore, the surplus planes of War days and the engines and other equipment of that time were ceasing to be used and new models as developed were finding application. With the U. S. air mail advertising for contract operation it was beginning to be realized that there was an open field where the most efficient and most economical planes would survive when operated most efficiently and economically.

At the end of 1926 between 3500 and 5000 airplanes were in commercial use in the United

States in addition to the huge fleet of airplanes used in air mail transportation. These air mail planes were flying approximately 6,000,000 miles a year over existing routes which totaled some 9450. Some 290 private operators in 1926 had flown considerably more than 5,000,000 miles with passengers in addition to an enormous mileage flown in miscellaneous service. At the end of the year there were 3608 landing fields in the United States, of which 255 were regularly appointed commercial fields, 310 regular municipal fields, and 2762 were emergency fields. The remainder belonged to the Army, Navy, air mail, and sea plane operators.

### BALLOONS

**NATIONAL BALLOON RACE.** The National Elimination Balloon Race, which annually selects the entries from the United States for the Gordon Bennett Cup Competition, took place at Little Rock, Ark., under ideal weather conditions, on April 29th. In this competition, the Litchfield trophy, presented by Paul W. Litchfield of the Goodyear Tire and Rubber Company, was offered for the successful balloon. At the time of the start there was a brisk southwest wind blowing and after the *Arkansas Gazette* pilot balloon, *Skylark*, cast off at 4.25 P. M., the nine contestants left the airport at five-minute intervals between 5 and 5.40, and proceeded to the northeast. Each balloon rose rapidly, clearing the airport enclosure at a height of from 400 to 1000 feet. The race again was won by Ward T. Van Orman, winner of the 1924 and 1925 elimination contests. He flew 848 miles, landing about 8 miles south-southwest of Petersburg, Va., in order to avoid being blown out to sea. Second in the competition was the *S-23* of the United States Army Air Service, piloted by Captain H. C. Gray, which made 635 miles, landing 7 miles north of Mt. Holly, N. C., and third place with 627 miles was taken by the *Akron N.A.A.*, piloted by John A. Boettner, which landed 1.5 miles north of Kimball and 7 miles northeast of Welch, W. Va. The pilots carried provisions for 48 hours and were equipped for sea-flying, each basket being lined or covered with rubber fabric and carrying either pneumatic pontoons or pneumatic boats and life-preservers. Each balloon had a radio set, including a loud speaker, so that the pilots were able to know the location of the various craft through a system of broadcasting from various radio stations. The details of the competition are given in the accompanying tabulation.

<i>Names of Pilot and Aide</i>	<i>Entrant</i>	<i>Name of Balloon</i>	<i>Landing Point</i>	<i>Distance in miles</i>
1. Ward T. Van Orman (W. W. Morton)	Goodyear Tire & Rubber Co., Akron, Ohio.	<i>Goodyear IV</i>	8 mi. South-SE of Petersburg, Va. ....	848
2. Capt. Hawthorne C. Gray (D. Johnston)	U. S. Army Air Service, Scott Field, Illinois	<i>S-23</i>	7 mi. North of Mount Holly, N. C. ....	635
3. J. A. Boettner (H. W. Maxson)	Akron Chapter N.A.A., Akron, Ohio	<i>Akron N.A.A.</i>	1.5 mi. North of Kimball, W. Va., and 7 mi. NE of Welch, W. Va. .	627
4. Lt. James F. Powell (Lt. James F. Early)	U. S. Army Air Service, Phillips Field, Md.	<i>S-21</i>	12 mi. due North of Hickory, N. C. ....	618
5. Herbert V. Thaden (C. D. Williams)	Detroit Flying Club, Detroit Aviation Society	<i>Detroit</i>	8 mi. W. of Guinere, Kentucky .....	574
6. Lt. Wm. A. Gray (Lt. Rowland Kieburts)	U. S. Army Air Service, Langley Field, Va.	<i>S-20</i>	Reedville, Ky., in Carter County .....	570
7. Svend A. U. Rasmussen (Edward J. Hill)	Detroit Aircraft Club, Detroit, Mich.	<i>Detroit Aircraft</i>	8 mi. W. of Blaine, Kentucky .....	566
8. Capt. Lawrence F. Stone (Capt. G. R. Oatman)	U. S. Army Air Service, McCook Field, Dayton, Ohio	<i>S-19</i>	1.5 mi. E. of Willow, Ky., and 7 mi. SE of Heidelberg, Ky. ....	510
9. Walter A. Ham (Robt. P. Lehr)	Walter A. Ham, Los Angeles, Calif.	<i>Goodyear Southern California</i>	5 mi. E. of Broadhead, Kentucky .....	473
10. W. O. Naylor (K. W. Warren)	The Arkansas Gazette, Little Rock, Ark.	<i>Skylark (pilot balloon)</i>	4 mi. N. of Crawford in Overton City, Tenn.	410

**THE GORDON BENNETT CUP RACE.** The annual race for the Gordon Bennett Cup took place at Antwerp, Belgium, May 30, with fourteen balloons, representing seven different nations. The original Gordon Bennett Cup previously had been won by Belgium outright in 1923, but a new cup was presented by the King of the Belgians, to replace the original trophy that had figured in so many competitions for aerostats or free-flying balloons. In this year's contest the Spanish entry and two French balloons could not get away on account of accidents of a minor nature and consequently did not figure in the competition. Leaving Antwerp the competing balloons were driven by a southwesterly wind which scattered them over Holland, Denmark, Norway, and Sweden. The race was won by the United States in the balloon *Goodyear III*, piloted by Ward T. Van Orman, which flew a distance of 534.9 miles and landed at Solvesborg, Sweden. Second place was also taken by the United States, with the U. S. Army balloon *S 16*, piloted by Captain H. C. Gray, which flew 372.2 miles and landed at Krakow, Poland. Third place was taken by the Belgian balloon *Belgica*, piloted by E. Demuyter, with 270.3 miles, which landed at Bliedersdorf, Hamburg, Germany. The accompanying tabulation gives the official results of the race.

to Detroit via Pittsburgh and Akron with its regular crew of 12 officers, 13 engineers, 15 riggers, two radio men, one cook, and one moving picture operator. The trip and its return were made without special incident, and the mooring mast in Chicago functioned properly.

**BRITISH AIRSHIPS R 100 AND R 101.** During the year the Royal Airship Works of the British Government near Bedford had under way new airships of 5,000,000 cubic feet capacity, which were designed to bring Australia in point of time to within 12½ days travel of England, South Africa within 6 days, Canada within 2½ days, and India within 5 days. The new State airship, *R 101*, as it was designated, the first to be started, was 730 feet long and was to have a gross lift of 150 tons, of which about 70 tons was to be available for fuel, water, crew, freight, and passengers. It was to be driven by five crude-oil engines aggregating 3000 horse power, and would fly at a minimum top speed of 70 miles per hour at 5000 feet. It would be able to cruise for 4000 miles at a speed of 63 miles per hour without re-fueling, and would carry approximately 100 passengers, freight, and 10 tons of mail. The airship was designed with all the accommodations of an ocean liner, with promenade decks, lounge, dining room, smoking room, and two and four berth cabins. At the

#### AIRSHIPS

**AIRSHIPS.** In the United States Naval Air Bill of 1926 provision was made for the construction of two rigid airships of six million cubic feet capacity and it was believed that this would afford an opportunity thoroughly to test the subject in the view of previous experience. The Bureau of Naval Aeronautics considered the matter quite thoroughly and was prepared to call for detailed plans and specifications from leading designers and manufacturers, but the appropriation bill itself did not carry with it funds and the matter was put forward.

**FLIGHT OF LOS ANGELES.** Among the flights made by the U. S. airship *Los Angeles* during the year was one to the National Air Races at the Philadelphia Sesquicentennial, where the ship arrived on Friday, September 10, and was brought to the ground for the first time at any other place than the home station at Lakehurst, the landing being successfully accomplished with the aid of the local detachment of seamen. Later in October the *Los Angeles* flew from Lakehurst

end of the year many of the component parts had been fabricated and it was expected that the main frame could be assembled within a few months, so that the airship would be completed at the end of 1927 or the beginning of 1928, by which time it was hoped that the various Dominion governments would provide mooring masts for its accommodation.

**ZEPPELIN AIRSHIPS.** With the prohibition removed from the manufacture of large airships in Germany, this industry in 1926 again began to assume importance. The Spanish Government ordered from the Zeppelin Company the largest airship of this type ever constructed, to cost 30,000,000 pesetas, and capable of flying from Seville, Spain, to Buenos Aires in the Argentine Republic. Later an attempt to fly around the world might be attempted by this ship. At the end of the year the *Z-127* was almost ready for use in the Spain-Argentine route. This airship was driven by seven engines and had a volume of 105,000 cubic meters, being 250 meters long, 31 broad, and able to carry 15 tons,

A new German super-Zeppelin of 3,700,000 cubic feet capacity was also under construction for an experimental transatlantic service and was progressing rapidly. In this ship the power was to be supplied by five 420 horse power Maybach engines, specially designed to burn carbonated hydrogen, a new fuel having the chemical formula  $\text{CH}_4$ , which was claimed to be lighter and more efficient than either gasoline or benzol. The products of combustion include water vapor, which, after the explosion in the cylinders, passes through the exhaust, condenses in tanks, providing ballast and water to replenish the cooling system. This water would compensate in part for the loss of weight from fuel consumed, and would obviate the necessity of wasting valuable inflating gas when ascending to high altitudes.

#### AIRPLANES

**AIRPLANE DESIGN.** While there were a number of large planes developed during the year the most striking progress, perhaps, was in light commercial planes which were brought to a point of greater efficiency and economy. Increased use of metal, welded metal frames and more reliable and efficient engines and manufacture continued to be leading characteristics of 1926 production and with these went their sale at reduced prices.

The tendency toward developing large planes was shown both in the bombing planes for military service and in those developed for passenger or freight transportation on established air routes. In the United States a new type of bombing plane built for the War Department was put in service during the year, being developed by the Huff-Daland Airplanes, Inc. This plane weighed approximately 8000 pounds without munitions, crew, gasoline, or other load, but when fully loaded it would carry 4000 pounds of bombs, munitions for two machine guns, 2500 pounds of fuel, and approximately 1000 pounds of personnel and equipment necessary to flight and combat, making a total weight of 16,000 pounds. In other words, 50 per cent of the final flying weight was useful, so that the plane had important military advantages. The spread of wing in the new bomber was 85 feet and the fusillage measured 65 feet in length. It was equipped with an 825 h.p. V-2500 engine.

Another large airplane was built in Germany at the Junkers Works, and was known as the *G-31*, or "Junkers Omnibus," being a three-engine monoplane built to carry 25 passengers and a crew of four. It was equipped with three 400 horse power Junkers L-5 engines. The plane was designed to afford comfortable sleeping accommodations, in addition to other compartments, and more space was provided for freight than in any plane built up to that time. Tests were being carried on with this machine through the latter part of the year.

**SIKORSKY AEROPLANE.** Ill fortune attended the giant Sikorsky Aeroplane *S 35*, built by the Sikorsky Aero-Engineering Corporation to make the flight between New York and Paris in a single stage to win the prize of \$25,000 offered by Raymond Orteig. The actual course as laid out was about 3600 miles, but fuel, oil, and other supplies were provided for a flight of 4330 miles, and it was believed that at an average speed of 100 miles per hour, the flight could be accomplished in about 1-1/2 days, though head winds or bad weather would necessitate longer

flying. The Transatlantic *S 35 Special* was designed as a passenger and freight carrier and was equipped with three Gnome-Rhône-Jupiter engines of French manufacture driving tractor propellers and developing 42 horse power each.

The Sikorsky-35 was duly assembled and had several test flights, one of which extended as far as Washington, D. C., and on its return included a flight across the flying field at Philadelphia. There developed, however, a lack of harmony in the enterprise, but after considerable discussion and differences of opinion and responsibility, the flight was set for September 21st. The plane had hardly left the flying field when it crashed to the ground and the mechanic and radio operator perished. Captain Fonck and his American alternate pilot, Lieutenant Lawrence W. Curtin, leapt clear of the blaze. The plane, however, was a total wreck.

**ENGINE DEVELOPMENT.** During 1926 the number of thoroughly reliable engines increased, several types of which were new developments, and for the first time the American aircraft industry was independent of the Liberty and other engines left over from the World War. For example, in the Airplane Reliability Tour for the Ford trophy, of twenty-seven planes entered only six failed to complete the tour, which was carried through on schedule. The engines used on these planes included such types as the Ford-Stout three-engine installation, the Ford-Stout single engine, and the 200 horse power Wright-Whirlwind air-cooled radial engine. The last-named engine also figured in the airplane used by Lieutenant-Commander Byrd, U.S.N., in his 16-hour flight to the North Pole, and also in a number of planes at the National Air Races in Philadelphia and at the Denver Mile-High Air Meet.

Another air-cooled engine developed during the year was the Pratt and Whitney Wasp, a nine-cylinder radial air-cooled engine rated at 400 horse power and operating at a normal high speed of 1900 revolutions per minute. The dry weight of this engine, including all accessories except the starter, was 650 pounds, or a little over 1.6 pounds per horse power, and it is interesting to note that with approximately the same horsepower as the Liberty engine there was a reduction of something like 200 pounds in dry weight. This engine was developed by the Pratt and Whitney Aircraft Company, in cooperation with the Bureau of Aeronautics of the United States Navy, and was adopted for use with pursuit and other planes in accordance with the policy of using air-cooled engines on airplanes going to sea with the fleet.

Another development of the year was the Curtiss V-1550 700 horse power water-cooled engine, which was a development from the Curtiss D-12 engine which previously had set a standard in high-powered, water-cooled engines. This engine was used in Lieutenant Cuddihy's plane at the Schneider Cup Race at Hampton Roads in November, but, unfortunately, was not shown to its best advantage, as a faulty gasoline pump caused the engine to run dry and let the aviator down, although he had made as high as 242 miles per hour in one of his laps over the course. The Packard engines in new models were produced during the year, in addition to the inverted engine, and functioned satisfactorily.

In Europe as well as in America the air cooled radial engine was coming into wider use

during the year and one type in France was fitted into about half of the airplanes exhibited at the Paris Aero Show in December. In addition, British, Italian, and Czechoslovak designers and manufacturers all were turning out efficient engines which were being used by new machines.

#### AVIATION RECORDS

During 1926 the French Government and the French aircraft industry made earnest efforts to secure for that country world's records, and M. Eynac, Under-Secretary of State for Aeronautics, announced a series of valuable prizes to encourage the design and manufacture of record-breaking aeroplanes. Possibly as a result of these prizes a number of interesting flights were made, by French fliers and new records made. On June 26th Captain Ludovic Arrachard, with his brother, Adjutant Arrachard, made a non-stop flight from Paris to Basra, Mesopotamia, a distance of 4305 kilometers (2675 miles) in 26½ hours,—using a Potez 28 biplane with a Renault 550 horse power engine, carrying with them 748 gallons of gasoline, or sufficient for a thirty-hour flight. This performance exceeded the record of Lieutenants Macready and Kelly of the U. S. Army who flew from New York to San Diego, Calif. 2650 miles in 27 hours.

This record, however, was supplanted on July 14–15, when Captain Girier and Lieutenant Dordilly flew 4715 kilometers (2930 miles) from Le Bourget Aërodrome at Paris to Omsk, Siberia in about 29 hours, using a Breguet 19 plane with a Hispano-Suiza 500 horse power engine. This record became the world record at the end of the year, having been accepted by the Fédération Aéronautique Internationale. On October 29 a still longer non-stop flight was made by Coate and Rignot, who flew from the Le Bourget Aërodrome to Djisk in Persia, a distance of 3415 miles in 32 hours. Their equipment consisted of a Breguet biplane equipped with a Hispano-Suiza 500 horse power engine and they flew via Strassburg, Vienna, Constantinople, Aleppo, and Basra. Captain Weiser and Lieutenant Challes of the French Army on Sept. 17, 1926 flew from Le Bourget to Bender Abas, 5174 kilometers (3750 miles), in 27 hours, or the same distance as between Brest and New York. These aviators employed a Breguet 19 A 2 plane with a Farman 500 c. v. engine.

The airplane record for altitude for a plane carrying no payload was broken on August 13, 1926, by M. Callizo, who, flying from the aërodrome at Buc, Versailles, France, in a Bleriot-Spad with a Lorraine 450 horse power engine, reached a height of 12,442 meters, or 40,820 feet, eclipsing his former record of 12,066 meters (39,586 feet), made on Oct. 10, 1924. The flight was made in the course of two hours and 25 minutes, and later in the year the record was accepted as official by the Fédération Aéronautique Internationale. On January 29 John A. Macready, U. S. Army Air Service, established an American air record of 35,900 feet, which, on March 13, he increased to 37,579 feet in an ascent over Dayton, Ohio, Macready in this flight encountered a temperature of 78 degrees below zero.

A record was made during the year for duration by an airplane with a payload of 2000 kilograms (4409.24 pounds) on July 24, 1926, when M. Robert Bajac flew 2 hours, 30 minutes,

37.2 seconds at Buc, Versailles. He used a Bleriot plane with four Renault engines of 230 horse power each. This record supplanted that of Bossoutrot, made on Nov. 12, 1925, of 2 hours, 19 minutes, 16¼ seconds. This record also was recognized by the F.A.I.

A speed record for seaplanes with a payload of 500 kilograms (1102.31 pounds) was made May 13, 1926, in France, by Lieutenant Demougeot in a Villiers seaplane with a Lorraine 450 h.p. engine. The new record was 203.275 kilometers (126.309 miles) per hour, supplanting the record of Lieutenant McDonald, U. S. Air Service, made at Hampton Roads, Jan. 23, 1926, of 179.497 kilometers (112.534 miles) per hour.

In a notable flight made Oct. 10, 1926, at Lac Majeur the Italian aviator Allesandro Passaleva, flying in the seaplane Savoia-Marchetti S-55. 2 "Asso," engined with two Isotta-Fraschini engines of 500 h.p. each, broke a number of records for seaplanes carrying a payload of 2000 Kg. (4409.24 lbs.) and flying in a closed circuit. The new record for duration was 5 hours 41 minutes 7 seconds; that for distance, 950 kilometers (590.3 miles); that for speed for 100 kilometers, 176.005 kilometers (109.361 miles) per hour; that for speed for 500 kilometers, 173.567 kilometers (107.849 miles) per hour. This flight also secured for Passaleva records for duration and distance for a seaplane with a payload of 1000 kilograms (2204.62 lbs.), and with a payload of 500 kilograms, the record for distance.

After Major de Bernardi had won the Schneider Cup at Norfolk, Va., on November 17, at Willoughby Spit, he flew with his Macchi-Fiat monoplane over a straightaway 3-kilometer course at an average speed for four laps of 258.873 miles per hour, making a new world's record for a seaplane, exceeding the 1925 record of Lieut. James H. Doolittle of the U. S. Air Service by more than 13 miles. This record for a seaplane compared favorably with the land-plane record of 278.48 miles per hour held by Adjutant Bonnet of France. Major de Bernardi's best speed was 272.132 miles per hour with the wind and his slowest 243.232 against the wind. He was timed by the same officials with the devices used in the Schneider Cup Race.

Another achievement of the year was a glider record made by the German pilot Kegel, who landed his glider 60 kilometers (37½ miles) from the starting point at the Rhône Meet on August 13th. This more than duplicated the previous record for distance made by Kegel at the Moscow Glider Meet earlier in the year.

#### AIR COMPETITIONS

THE NATIONAL AIR RACES. This important American competition opened on Saturday, September 4th, in connection with the Sesqui-Centennial Exposition at Philadelphia, taking place at the Model Farms Field, just southwest of the Exposition grounds. The rain somewhat marred the meeting and the Model Farms Field was in such poor condition that in some of the events, especially for the heavy bombing, transport and pursuit planes the Mustin Field in the nearby Navy Yard was used. The entries for the 19 race events of the week included 215 planes, and in addition there were numerous other contests, including many parachute jumps and displays by the Army and Navy aviators detailed

to the Exposition or sent specially to the meeting.

As in previous years, there was a long-distance event entitled the "On to the Sesqui Race," which attracted 22 entrants and was won by Fred. Day Hoyt of Eureka, Calif., who flew from that place, 2558 miles, in 31 hours, flying time. He was awarded the Sesqui-Centennial Trophy and first prize of \$1200. He flew in an OX-5 Travel Air plane and landed at the Model Farms Field on September 1st, at 6.02 A.M.

The first event of the regular programme was the elimination race for the Aero Club of Pennsylvania trophy, a free-for-all race for two or more passenger low-powered airplanes, over a course of 60 miles, five times around the triangular 12-mile course laid out for the distance races from the Model Farms Field pylon, across the Delaware River to Paulsboro, New Jersey, then to Woodbury, N. J. and back to the field. In this race, limited to civilians, the planes had an engine piston displacement not exceeding 510 cubic inches, and had to carry a total load of 340 pounds, including the pilot. It was won by Basil Rowe in a Thomas Morse S4E plane with an aeromarine T. B. engine, who made a speed of 109.59 miles per hour.

The Independence Hall trophy formed the second competition of the opening day and was a free-for-all civilian race for two, three, or four seater planes over a distance of 84 miles or seven laps of the 12-mile course, and attracted 9 contestants. The race was for planes with a total engine displacement of 800 cubic inches or less, carrying 340 pounds. First prize of \$1000 was won by C. S. Jones in a Curtiss Oriole plane with a Curtiss C-6 engine, it being the third consecutive year that this aviator had won this event.

On Labor Day, September 6th, a novelty relay race for the B. B. T. trophy was started for machines with a total engine displacement not to exceed 510 cubic inches, over a distance of 36 miles. Four teams of three planes each started, and the winners were C. S. Jones, A. H. Kreider, and Basil Rowe, the first and last flying in Thomas Morse planes and Kreider in a Waco 9, all with OX-5 engines. In this race, on the completion of the first lap the pilot landed, his passenger who jumped out of the plane and entered the second machine of the team, placing his colored pennant on it, and then flying the second lap entered the third machine.

The final event of Labor Day was a competition of National Guard pilots for the National Guard Trophy, all entrants flying in a Curtiss Jennies with a minimum wing area of 350 square feet and accompanied with a direct drive engine with a total cylinder displacement of not more than 720 cubic inches. The distance was 84 miles and 11 planes took part, five being from the Pennsylvania National Guard, five from the New York National Guard, and one from Maryland. The race was won by Carl W. Rach of the New York National Guard, with an average speed of 93.08 miles per hour, second and third places also going to entrants from New York State.

After an interval caused by rain and storm the National Air Races were resumed on September 8th, with the second heat of the elimination trial for the Aero Club of Pennsylvania trophy. In this competition the Pitcairn Rac-

ing Sesqui-Wing Arrow plane, fitted with OX-5 engine, was forced to land on the first lap, and Kreider in his Waco 9 was forced down by engine trouble on the second lap with severe damage to the plane but no injury to the aviator. The race was won by Fred. Hoyt in a Travel Air plane with OX-5 engine, at a speed of 96.554 miles per hour. In the Town and Country Club of Detroit trophy race James G. Ray, in his Sesqui-Wing Arrow plane won the competition with a mean speed of 136.3 miles per hour. In this race efficiency was figured in a separate competition which was won by the Wright-Bellanca machine with a W. B. 2 Whirlwind J 5 engine, which carried 1292 pounds at 121.358 miles per hour, gaining a total of 678.5 points. Another interesting contest was the Light Plane Competition, which was won by E. B. Heath in the Heath Tomboy plane with a Bristol Cherub engine. This machine made 91.291 miles per hour.

On September 9th, the final heat of the race for the Aero Club of Pennsylvania trophy took place, in which heat the winners of the two elimination races were eligible to compete. There were 12 entries, but two of the slower planes did not start and three dropped out on account of engine trouble, leaving seven planes to finish the race. The first prize of \$1000 was won by Robert Hewitt in the Waco 9 plane with OX-5 engine, who made a speed of 107.156 miles per hour, with a time of 46 minutes, 56 seconds, for the 84 miles.

The Liberty Engine Builders' Trophy Race for observation planes brought out a field of 11 service planes representing the United States Army and Navy. The Navy flew in a special DH plane (Packard 1A-1500) and a Vought UO-1 (Wright J-4), while the Army flew in the Douglas O-2 planes with Liberty engines or the Curtiss O-1 Falcon Observation planes with Curtiss D-12 engines. First place in this competition was won by Capt. Ira Baker, U. S. A., flying in a Curtiss O-1 plane with a Curtiss D-12 engine, which made a speed of 142.263 miles per hour. Second place was taken by Capt. Aubrey Hornaby in a similar machine, with a speed of 141.830 miles per hour, and third place went to the Special DH plane with the Packard engine, piloted by Lieut. G. T. Owens, U.S.N., who made 140.526 miles per hour.

On September 10th, the competition for the Liberty Bell trophy for large bombing planes was flown from Mustin Field in the adjoining Navy Yard, each plane being timed on a flying start as it passed the home pylon. In this race of over 120 miles, or 10 circuits of the 12-mile course, the machines had to show a speed greater than 85 miles per hour and have a wing area of not less than 600 square feet. The United States Army Air Corps entered six planes, three being the Douglas transports designated as C-1, with 400 horse power Liberty engines, and the other three Huff-Daland Pegasus light bombers designated LB-1, equipped with Packard 2A-1500 engines of 800 horse power, this last type of machine being one of the largest wing engine bombing planes in the world. The Douglas planes carried loads of 800 pounds, while the Huff-Daland machines carried 1250 pounds each. The first three places in this competition all went to Huff-Daland Pegasus planes, the first place being taken by Lieut. L. M. Wolfe, who made the course in 58 minutes,

11.91 seconds, or a speed of 123.714 miles per hour. The first of the Douglas planes to finish was that of Capt. F. I. Elgin, who took 62 minutes 42.73 seconds, or a speed of 114.810 miles per hour.

A close race was had for the Mitchell trophy, which was confined to machines of the first pursuit group, there being nine entries of similar planes, all being Curtiss P-1 Hawk Pursuit planes with Curtiss D-12 engines and Curtiss-Reed propellers. The course was 10 laps, or 120 miles, and first place was won by Lieut. L. G. Elliott, with a speed of 160.438 miles per hour. As indicating the excellent flying of all and the close condition of the contest, it was interesting to note that the last plane in had a speed of 157.070 miles per hour.

In the Detroit News Air Transport trophy the planes had to carry a minimum contest load of 1000 pounds in addition to the pilot and had to show a minimum useful cargo space of 40 cubic feet. There was a competition for speed and another for efficiency, and the distance was 120 miles, or 10 laps of the course. For efficiency not only speed and load were considered, but also the engine displacement, and by a formula, a figure of merit was found which determined the position of the contestants. Four planes were entered in this race, which was won by C. C. Champion, Jr., who flew the Wright-Bellanca WB-2 monoplane equipped with a Wright Whirlwind engine at a speed of 121.532 miles per hour. This plane also won in the efficiency competition, scoring 896 points.

For the Kansas City Rotary Club trophy, open to Army or Navy pilots and all pursuit type machines, over a distance of 120 miles, there were 12 entries, eight coming from the Air Corps, three from the Navy, and one from the Marine Corps. First place was taken for the Navy by Lieut. C. T. Cudahy, U.S.N., who flew in a Boeing Fighter FB-3 plane with a Packard 2A-1500 engine of 600 horse power, making a speed of 180.495 miles per hour, or 39 minutes, 53 seconds for the course. An interesting feature of this contest was the fact that two air-cooled engines, one a radial engine and the other an inverted Liberty engine, were employed. This contest attracted unusual attention, as it took the place of the Pulitzer Race, which was not held in 1926. On the concluding day of the show the novelty relay race for the Benjamin Franklin trophy was held and was won by a team consisting of Basil Rowe and C. S. Jones in Thomas Morse planes and A. H. Kreider in a Waco 9 plane.

In the Dayton Daily News Light Aéroplane Trophy Competition, involving a flight of 12 laps around a 5-mile course, first place was taken by E. B. Heath in the Heath Tomboy plane with a Bristol Cherub engine of 75 cubic inches. Heath's speed, which won him the trophy and \$750 cash, was 86.454 miles per hour. The same machines also took part in the race for the Scientific American Trophy, and in addition, C. D. Chamberlain flew the Bellanca plane with three-cylinder Lawrence engine. This trophy and \$750 were won by Kreider with a speed of 94.495 miles per hour, and second place and \$500 by Heath, with 91.217 miles per hour.

At this air meet 164 entries flew in races which covered in the aggregate about 1350 miles without a single serious accident, and the planes flown seemed in general to indicate an im-

provement over previous years, there being comparatively few War surplus planes flown. It was only in the National Guard Race that antiquated planes competed. All of the planes manufactured since 1920 flown by civilians and one modern plane of naval design had metal fuselages, while the Ford three-engine plane had metal wings. In the case of the Army bombers welded steel wing-beams were employed, but these were covered with fabric.

**SCHNEIDER CUP RACE.** The ninth international contest for the Jacques Schneider Cup for seaplanes, which was presented in 1913, when the first race was held, took place at Hampton Roads, Virginia, on November 13, after postponement for unfavorable weather, and was won by the Italian plane flown by Major Mario de Bernardi. The course was seven times around a 50 kilometer triangle, and the average speed of Major de Bernardi was 246.496 miles per hour, establishing a world's record and breaking the record made by Lieut. J. H. Doolittle, U.S.A., in 1925, who flying in a Curtiss R-3C-2 racer had made 232.573 miles per hour. In the 1926 race Major de Bernardi who flew in a Macchi Fiat plane with 800 h.p. engine, broke a number of seaplane speed records and covered the 350 kilometers (217.483 miles) in a total elapsed time of 52 minutes, 56.22 seconds. Major de Bernardi made a record of 248.189 miles per hour for 100 kilometers on the fifth and sixth laps, and on the third and fourth laps, flying at an average speed of 247.8115 miles per hour, and these two combined with the last two laps, made a world's record for 200 kilometers. Second place in the race was won by Lieut. Christian Frank Schilt, U.S.M.C., who flew in the R-3C-2, the winning Curtiss racer of 1925, with an average speed of 231.363 miles per hour or more than one mile per hour slower than the same plane made in 1925, though the 1926 course, on account of its sharp corners, was considered a slower course. The other competitors were: Lieut. Adrian O. Bacula, who flew in the Macchi-Fiat model plane Number 1 at an average speed of 218.006 miles per hour, with an elapsed time of 59 minutes, 51.30 seconds; Lieut. William G. Tomlinson, U.S.N., who flew in a standard service Curtiss Hawk seaplane, with an average speed of 136.953 miles per hour and a total time of 1 hour, 35 minutes, 16.72 seconds; Lieut. George T. Cudahy, U.S.N., who flew in the R-3C-4 Curtiss V-1550 racer, who was forced to retire from the race by the failure of his gasoline supply on the seventh lap; and Captain Ferrarin of the Italian team, who flew in a Macchi-Fiat machine and was forced out on the fourth lap due to failure of the lubrication system, but with his plane otherwise intact.

It was announced after the Schneider Cup competition that, instead of an annual race for seaplanes, this event would be held every two years and the next race would be in 1928 in Italy. The proposal for the change was made by the British Navy air authorities, as it was believed that the longer period would permit a wider development of seaplane racing craft, and the suggestion received the approval of the Fédération Aéronautique Internationale.

**COMMERCIAL AÉROPLANE RELIABILITY TOUR.** The second annual Commercial Aéroplane Reliability Tour for the Edsel B. Ford trophy and a cash prize of \$5000 started from Detroit

August 7, with 27 planes, and finished at the Ford Airport at Dearborn on August 21, the total distance traveled being scheduled at 2560 miles, over 14 cities, and involving stops at Kalamazoo, Chicago, Milwaukee, St. Paul, Des Moines, Lincoln, Wichita, Kansas City, Moline, Ill., Indianapolis, Cincinnati, Cleveland, and Fort Wayne. First place in this competition was won by Walter Beach in a four-seater Travel Air plane carrying 600 pounds contest load, and equipped with a Wright-Whirlwind engine, with a score of 4043.3 points and an average speed of 124.5 miles per hour, with a cash prize of \$5000, in addition to holding the Edsel B. Ford trophy for a year. Sixteen contestants finished and the trip was successful in all respects, the only serious mishap occurring to Major Schroeder's airplane, which was forced down when the right engine fell away from its supports due to the loosening of the metal propeller from the hub. Though it had no landing gear, the machine was brought to the ground without serious injury to either the pilot or the occupants. Six planes were forced to drop out of the tour, the majority of the causes being due to motor troubles, most of which occurred with war-time engines.

**LIGHT PLANE COMPETITION.** During the year in Europe considerable interest was manifested in light planes and an international competition was held at Orly, near Paris, France, from August 9 to 15. This competition was open to single and two-seater sport planes, and the elimination trials involved a speed and fuel consumption trial over a 50 kilometer circuit with a climb to 1000 meters; take-off and landing trials of minimum distance and a climb to 2000 meters; starting the engine three times within 15 minutes, one start being cold; and disassembling and assembling trials in which the machine, with the wings taken down, was pushed through a tunnel representing a small hangar and then set up again for flight. There was a race from Orly to Orleans and back, a distance of 192 kilometers, as the final test. Two-seater planes were allowed, in the 50 kilometer consumption trial, a fuel-consumption of 14 kilograms, as against 8 kilograms for single-seaters, and this contributed to the success of the winning plane, an Avia BH10 two-seater monoplane equipped with a 60 h.p. Walter air-cooled engine, which was piloted by Dr. Zdenko Lhota. This airplane attained a speed of 149.6 kilometers per hour, climbed to 2000 meters in 16 minutes, 15 seconds, landed in 120 meters, took off in 80 meters, was disassembled and assembled in 11 minutes, 34 seconds, and consumed 6.7 kilograms of fuel over the 50-kilometer circuit.

**BRITISH LIGHT PLANE COMPETITION.** A competition for light planes was held at Lympne, on the Southeast coast of England, September 10-17, with three additional races on September 18, and aroused great interest. For this competition 15 types of light planes were entered, six of which were of new design, not having appeared in the previous competition at Lympne, held in 1924. There were 16 actual entries, three of which did not actually arrive, so that 13 competed. At this meet interest centred in the efficiency competition for £5000 (\$25,000) in prizes offered by the *Daily Mail* (London), the first prize being £3000. This competition was based on the useful load carried by the planes per unit of fuel consumed during the period of

the contest and the rules permitted the entry of any airplane where the weight of the engine was not over 170 pounds. This weight included carburetor, induction system, ignition equipment, propeller hub and fittings, exhaust pipe and radiator pipes, and water, if any, though all the entries were fitted with air-cooled engines. The conditions further required machines to be two-seaters with dual control, an air-speed indicator being visible from each seat, and capable of accommodating a normal six-foot person. The useful load had to be a minimum of 340 pounds, including the weight of pilot and passenger, and additional useful load to the amount prescribed by the Air Worthiness Certificate was permitted to be carried anywhere in the machine. Certain repairs and replacements were allowed during the competition and entrants were permitted to replace a complete ignition system as necessary, though this point was extensively criticised during the tests. A series of elimination tests was the first feature of the programme, where the airplanes had to be folded up or dismantled completely and transported a distance of 25 yards, placed in a small shed, and then reerected for flight, not more than an hour and the services of two men being required.

In the competition proper a series of circuits were flown on successive days, averaging about 300 to 350 miles and totaling 1964 miles, various coast towns being visited in order to arouse as much interest as possible in these small planes. Nine planes participated, and of these five were retired, leaving four at the end. First prize, £3000, went to the Hawker Signet biplane with a Bristol Cherub 3 air-cooled engine, flown by Flight Lieut. P. W. S. Bulman, weighing 420 pounds empty, 900 pounds loaded, useful load 429 pounds, fuel used 388.83 pounds, over all average speed 64.98 miles per hour, total flying time 30 hours, 41 minutes, giving a total of merit of 2203.

#### NOTABLE FLIGHTS

**NOTABLE FLIGHTS.** The year 1926 was marked by a number of notable flights by aircraft under various conditions, which indicated that progress had been made in the power, and reliability of engines, and in the general design of airplanes and airships.

**SPAIN TO BRAZIL.** The first important flight of the year was made by Commander Raimond Franco, who, with four companions, left Palos, Spain, on January 22, in the airship *Ne Plus Ultra*, arriving at Las Palmas, Canary Islands, the same day. Thence they flew to Porto Praya, in the Cape Verde Islands, a distance of 1056 miles, on January 26, and on January 30, took off for the longest and most difficult of their flights, to the Island of Fernando do Noronha, off the Brazilian coast, a distance of 1432 miles. This was the eighth air crossing of the Atlantic and was accompanied by complete success, although the rear propeller was damaged in riding out the heavy seas at Noronha. The next stage was to Pernambuco, where a new propeller was fitted, and from there the route led down the coast to Rio de Janeiro, reached on February 4th, a distance of 1264 miles. The fliers also flew to Montevideo and made a short flight to Buenos Aires. The plane used was one of the Dornier Wal type, and, with the exception of the damaged propeller, made its flight in accordance with the original plans.

**NEW YORK TO BUENOS AIRES FLIGHT.** One of the long-distance flights of the year was that of Bernard Duggan, who left New York on May 24, for Buenos Aires, flying in a Savoia flying boat. Duggan left New York on May 24 and made his way south, waiting for good weather and taking the journey in stages. He was held up at Maraca Island, off the coast of Brazil, for a number of days in June but took off on July 3, and reached Para, Brazil, in two jumps on July 5. The flight was continued to Buenos Aires, which was reached on August 13.

**DETROIT ARCTIC EXPEDITION.** The first notable trip to the north was that of the Detroit Arctic Expedition, under the leadership of Captain George Wilkins, with Lieut. Carl B. Eielson as chief pilot and Maj. Thomas G. Lamphier, formerly of the First Pursuit Corps, Army Air Service. This expedition made its base at Fairbanks, Alaska, and there erected two planes, a Fokker single-engine monoplane and a Fokker three-engine plane of the same type used by Commander Byrd. (See below.) Both planes met with accidents on preliminary tests but soon were put in first-class flying condition. Provisions and supplies were transported from Fairbanks to Point Barrow, selected as the advance base. On March 31, Captain Wilkins and Lieutenant Eielson left Fairbanks in the single-engine plane *Alaskan* for Point Barrow, carrying 3000 pounds of supplies. At the latter point they set out again in a northerly direction without landing and returned to Fairbanks on April 7, having penetrated further north than had been explored before from this particular region. In the course of this flight Captain Wilkins flew 140 miles to the north from Point Barrow and did considerable exploring over an area which hitherto had not been known. On April 10, Wilkins and Eielson made a second flight from Fairbanks, carrying a load, in addition to the crew, of 4100 pounds. These explorations indicated the suitability of airplanes for polar exploration, as was borne out later in the year, when Commander Byrd made his record flight to the Pole.

**THE NORGE POLAR FLIGHT.** The first time that the North Pole had been crossed by aircraft and the first long flight across the Arctic started on May 11, when the Italian airship *Norge*, carrying the Amundsen-Ellsworth expedition, left King's Bay, Spitzbergen, at 8.55 A.M. and crossed the North Pole at 2.30 P.M. on May 12. This trip was of interest in view of the fact that the *Norge* left Rome, Italy, and sailed to Pulham, England, a distance of 1200 miles, and thence proceeded to Oslo (Christiania), 750 miles, to Leningrad, 720 miles, to Vadsoe, 300 miles, and finally to Spitzbergen, its point of departure, 650 miles further. The trip from King's Bay to the Pole was made without difficulty at an approximate speed of 60 miles per hour and at an altitude of between 1000 and 2000 feet. The *Norge* was in radio communication with civilization until shortly after 2 P.M., Greenwich time, on May 12, from which time she was out of communication until late on May 15, when it was announced that she had landed at Teller, Alaska, about 75 miles northwest of Nome. The flight proceeded successfully at normal average speed as far as Point Barrow, but between here and Teller high winds and heavy fog were encountered and large

pieces of ice thrown off by the propellers pierced the fabric hull of the airship, requiring immediate repairs. In the latter part of the flight off Cape Prince of Wales, Alaska, bearings were lost completely until land was sighted, and with a wind increasing in strength, it was decided not to attempt to reach Nome, as planned, but to make a landing at Teller. This was successfully done at 3.30 A.M. on May 14, after a flight of 2700 miles from Spitzbergen. The airship was deflated and packed for transportation back to Rome. The log of the *Norge* revealed the fact that the distance of 2000 miles from Spitzbergen to Point Barrow was accomplished in 46 hours, including  $2\frac{1}{2}$  hours spent in cruising around the North Pole, or a rate of 46 miles per hour. From Point Barrow to Teller, however, a distance of 700 miles, 25 hours were required, or a rate of 28 miles per hour. The actual distance from Spitzbergen to Teller, as reckoned by the pilot, was 3291 miles, as compared with a straight-line distance of 2700 miles.

The *Norge* was a semi-rigid airship, 325 feet in length, with a cruising radius of 3600 miles. She carried 30 tanks for fuel, each containing 67 gallons, or a total of 2000 gallons weighing 13,000 pounds. Extra fuel was carried in tins. This fuel capacity enabled the airship to travel over 3000 miles at a speed of 50 miles per hour, or a flight duration of 65 hours. The envelope of the airship consisted of strong three-ply rubberized fabric, the keel was of steel tubing, the front part of which carried a shield-shaped structure to resist aerodynamic pressure on the envelope. At the rear of the keel there was carried a system of rings which supported the elevators and rudders so that their functioning was independent of the tail plane and rudder. There were three engine nacelles, two on the side and one at the stern in the centre, suspended from the keel by steel cables, each having room for one engineer who was protected from the wind. The *Norge* was built by Col. Umberto Nobile, who was the first pilot. See POLAR EXPLORATION.

**AIRPLANE FLIGHT TO THE NORTH POLE.** One of the notable events in aeronautics of the year 1926 was the flight of Lieutenant-Commander Richard E. Byrd, U.S.N., and Pilot Floyd Bennett to the North Pole and back from King's Bay, Spitzbergen, which took place on May 9. The plane selected for this expedition was a Fokker airplane equipped with three Wright-Whirlwind engines. While the flight was made in good weather, nevertheless due consideration had to be taken of the climatic conditions and the ability of the plane to rise from soft snow with a total weight of 10,000 pounds and on skis. The expedition left New York on Apr. 6, 1926 on the S. S. *Chantier*, carrying with it both the Fokker plane and a Curtiss Oriole. The heavy Fokker plane was duly removed from the hold of the steamer and taken ashore on a raft, where it was assembled and moved up a hill, so that, with a runway of 1000 feet in length through the snow, a good take-off would be possible. After an unsuccessful attempt leading to a reduction of weight at 12.30 A.M., Greenwich time, May 9, a second start was made with a perfect take-off and the machine was headed due north towards the Pole. The plane, as fitted for this flight, carried, in addition to the navigation equipment, gasoline and oil, a short-wave radio with hand dynamo in case of

a forced descent, a hand-made sled for man-hauling supplies over the snow, two and a half months' carefully selected food, a rubber boat for getting across leads in the ice, extra fur clothes and shoes, fire-arms and ammunition, a gasoline stove, a light waterproof tent, hunting knives, ice knives and axes, a complete medical kit with surgical instruments, and smoke bombs for signals. Leaving King's Bay, Cape Mitre, 20 miles distant, was passed, and then Amsterdam Island, Haakon Peninsula with its peak 2000 feet in height, and Danes' Island, where Andrée, in 1896, had taken his departure to cross the Pole in a balloon, never to be heard from again. Leaving behind Nome Land, the actual ice-cap was reached with perfect weather and, flying at a height of about 2000 feet, the flight was maintained at a temperature of approximately 20 degrees below freezing, Fahrenheit, the journey being made over almost solid ice without sighting land. The three engines were consuming about thirty gallons of gasoline per hour, or about two gallons more than had been anticipated, but they were making a speed of 90 miles per hour and later in the flight the gasoline consumption dropped to the normal. An oil leak in the right engine reduced the speed at a distance of about one hour from the Pole, and it was necessary to cut out one motor and operate with the remainder. This brought the speed down to 60 miles per hour and the Pole was reached at 9.04 A.M., Greenwich time. After flying around the region of the Pole for a few minutes, it was found that the leaking engine was functioning, the leak being due not to the engine, but to the spare oil tank which had been fitted into the plane. The return course was set direct for Grey Hook, Spitzbergen, a few miles east of Amsterdam Island, and with a following wind the plane proceeded in its southerly direction. At 2.30 P.M., Greenwich time, land was sighted ahead, showing how accurate had been the navigation, and King's Bay was reached about half-past three, after a flight of fifteen hours, during which the engines ran without a hitch and the plane functioned in a most satisfactory manner.

SIR ALAN COBHAM'S FLIGHTS. In 1925 the British aviator Alan J. Cobham had flown from London to Rangoon and back, taking as a passenger Air Vice-Marshal Sir Sefton Brancker, the Director of Aviation in the British Air Ministry. On November 16 of 1925, in the same machine, a DH50J airplane equipped with a Siddeley Jaguar Radial air-cooled engine, Cobham left London bound for Cape Town, with the object of determining the feasibility of the operation of an air service to that point by the Imperial Airways, Limited. He was accompanied by a companion, a mechanic, and a moving picture operator, and the flight was of interest in view of wide changes of climate which were encountered. Leaving London, as stated, on November 16, and making various stops, he flew to Athens, a distance of 716.65 miles, where there was a delay of 16 days caused by repairing damaged pistons in the engine. At Cairo, reached on December 7, there was a delay of nine days while arrangements were made for fuel supplies, and at Khartum, reached on December 22, there was a further delay of six days. From this point progress was made by convenient stages until February 15, when Cape Town was reached, a distance of 8020 miles. The return journey was made somewhat more quickly, Cape Town being

left on February 26 and London reached on March 18. The flying time for the homeward trip was 80 hours, and the total outward and return journey was 16,130 miles.

On October 1 Cobham reached London after a flight from Melbourne, Australia, in which a total distance of approximately 26,000 miles was accomplished. He left the Midway at Rochester, England, on June 30 crossing the continent to the Mediterranean and continuing across the deserts of Arabia, losing in the Irak Delta his mechanic A. B. Elliott, who was shot from the ground by an Arab. Taking in his place Sergeant Ward of the R.A.F. he continued the flight to Australia, flying through India during the heavy monsoons, and, after unfavorable weather, reached Rangoon. On August 15 he arrived in Melbourne, and on August 29 left on his return trip intending to make a rapid dash, but his progress was interfered with by severe monsoon storms in the vicinity of Burma. As stated, he reached London in the afternoon of October 1 and was enthusiastically received, being knighted by the King. It was interesting to note that the identical airplane had been used on each of his three great flights and probably had as high a total mileage as any machine ever flown in such service. It had passed through various extremes of weather, and afforded proof of the durability of a modern airplane of high-grade construction.

In November Sir Alan Cobham came to America on a lecture tour and was enthusiastically received, being tendered many honors by flying and other organizations. It was estimated that he had to his credit a total distance of approximately 500,000 miles in his extended air journeys.

PAN-AMERICAN FLIGHT. During the autumn the U. S. Army Air Corps planned a flight around South America, to be undertaken by a squadron of Army planes. This expedition, postponed a day on account of bad weather, started from New York at 10.35 A.M., December 21, under the command of Major Herbert A. Dargue, Air Corps, U.S.A. The squadron consisted of five Loening amphibian planes, the flag plane being the *New York* and the others the *San Antonio*, the *San Francisco*, the *Detroit*, and the *St. Louis*. At 5.30 P.M., December 22, the planes landed at Huasteca Field, across the river from Tampico, Mexico, and at 8.30 P.M., on the following day the *San Francisco* arrived at Vera Cruz, being the only one of the planes leaving Tampico to reach that city. The *St. Louis* was forced to land owing to a damaged engine and the other planes waited until repairs could be made, the officers of the expedition, in the meantime, going by rail to the capital and, on December 27, presenting the good wishes of President Coolidge to President Calles of Mexico. The flight was resumed later. In the meantime, the various engine troubles having been overcome, the planes proceeded from Vera Cruz on December 31, at 10.15 A.M., landing at Minatitlan, near Puerto Mexico, and proceeding from there to Salina Cruz, which they reached at 12.48 P.M., crossing the isthmus at Tehuantepec.

#### AIR MAIL

UNITED STATES AIR MAIL. The year 1926 was important in the development of the United States Air Mail, not only on account of the

### AVIATORS OF THE NORTH POLE AIRPLANE EXPEDITION

LEFT TO RIGHT: LIEUTENANT GEORGE O. NOVILE, U.S.N.R., FLIGHT ENGINEER (DID NOT PARTICIPATE IN THE POLAR FLIGHT); LIEUTENANT-COMMANDER RICHARD E. BYRD, U.S.N., COMMANDER OF THE EXPEDITION; AND FLOYD BENNETT, PILOT

establishment of the through continental air mail between New York and San Francisco with over-night flying between New York and Chicago, but on account of the inauguration of contract mail service with the actual establishment of a number of air mail routes on this basis, with contracts awarded or bids called for on others. The airway between New York and Salt Lake City, 2045 miles, had been lighted, so that it was possible to dispatch mail by plane from the New York terminus at 11 A.M., and have it arrive at San Francisco, 2669 miles, at 4.30 P.M., the following day, and to have mail leaving the San Francisco terminus at 8.45 A.M. arrive in New York at 6 P.M. the following day. The lighted airway was established from Rock Springs to Salt Lake City, a distance of 159 miles, and this permitted belated planes to continue at night instead of being held until daylight to renew flight at Rock Springs or Salt Lake City. The plan of the Post Office Department provided for lighting the entire route between New York and San Francisco, so that letters sent after the close of the business day, instead of in the morning, would be received at their destination on the Atlantic or Pacific Coast with the loss of but one business day. Mail leaving New York, for example, on Saturday night, would be delivered in San Francisco in the first delivery on Monday morning.

Since July 1, 1924, the transcontinental mail planes carried mail at airplane postage rates of ten cents an ounce for the New York to Chicago route and eight cents an ounce for each of the three zones, New York-Chicago, Chicago-Cheyenne, Cheyenne-San Francisco, of the continental route. Late in the year it was announced that there would be a flat air mail postage rate of 10 cents per half ounce, irrespective of distance, effective early in the following year.

At the date of the Postmaster General's Annual Report, the air mail had 83 planes, 64 of which were equipped for night flying, most of them being DeHaviland type with Liberty motors, which were built by air mail employees at Maywood, Ill. The building of planes by the Department at Maywood was discontinued and Douglas planes and spare parts were being purchased from the manufacturers. During the fiscal year ending June 30, nine contract air mail routes were placed in operation, as follows:

Chicago, Ill., via Peoria and Springfield, Ill., to St. Louis, Mo., and return.

Chicago, Ill., via Moline, Ill., St. Joseph and Kansas City, Mo., Wichita, Kans., Oklahoma City, and Fort Worth, Tex., to Dallas, Tex., and return.

Salt Lake City, Utah, via Las Vegas, Nev., to Los Angeles, Calif., and return.

Elko, Nev., via Boise, Idaho, to Pasco, Wash., and return.

Detroit, Mich., to Cleveland, Ohio, and return.

Detroit, Mich., to Chicago, Ill., and return.

Chicago, Ill., via Milwaukee and La Crosse, Wis., and St. Paul, Minn., to Minneapolis, Minn., and return.

Jacksonville, Fla., via Tampa and Fort Meyers, Fla., to Miami, Fla., and return.

Cheyenne, Wyo., via Denver and Colorado Springs, Colo., to Pueblo, Colo., and return.

In addition, contracts were awarded for transportation of mail by aircraft between Boston and New York, via Hartford; Seattle, Wash., and Los Angeles, Cal., via Portland and Medford, Ore., Sacramento and San Francisco, Fresno and Baker's Field, Cal.; Cleveland, Ohio, and Pittsburgh, Pa.; and Atlanta, Ga., and Jacksonville, Fla.

During the fiscal year ended June 30, 1926, the Post Office Department operated planes on Government lines, flying a total mileage of 2,256,137, on a schedule calling for 2,411,059 miles of mail trips, or a percentage of performance of 94. Planes flying at night carried mail on Government operated lines amounting to 945,654 miles. After Feb. 15, 1926, various contract routes were brought into service, which added a mileage, between that time and July 1, of 378,478 miles. During the fiscal year the Government-operated routes carried 353,641 pounds of air mail, of which 107,047 pounds were handled by the over-night service inaugurated in 1925 between New York and Chicago. In the previous fiscal year, which did not include the over-night service, the total amount of mail carried by airplane was 232,513 pounds. The excess postage received for air mail transportation during the fiscal year 1926 was \$861,865.05, or an increase of \$259,237.51 over the preceding year. Of the 1926 receipts, \$160,881.04 was received on the New York-Chicago over-night route.

The Post Office Department reported that after the end of the fiscal year, June 30, the receipts in the transcontinental route increased, amounting in July to \$73,137.45, or an increase of \$12,703.80. In August they were \$8,275.66, an increase of \$18,459.69. In September receipts were \$82,769.59, or a gain of \$22,776.87 over the corresponding month of 1925, while in October receipts were \$90,906.10, or \$30,642.82 greater than in October of 1925.

As the year progressed the air mail service more than fulfilled expectations and in their transcontinental flights the mail aviators broke many commercial records. This was in addition to improving the general standard of service. According to a bulletin of the U. S. Post Office Department, Pilot Jack Milatz on December 16 flew from Chicago to Cleveland, 327 miles, in 1 hour and 59 minutes, or at the rate of 164.8 miles an hour. The best previous time was 2 hours and 2 minutes. Pilot Harry Chandler flew from Cleveland to New York, 299 miles, in 2 hours and 21 minutes, or at the rate of 169.7 miles an hour. The best previous time was 2 hours and 30 minutes. The flying time on this same date from Chicago to New York was 4 hours and 20 minutes, or at the rate of 167.3 miles an hour. The best previous time for this trip was 4 hours and 35 minutes.

The comparative speed records made during the month of December, 1926 and December, 1925, between different air mail stations are given in the following summary issued by the Post Office Department. It shows clearly the improvement during the year.

New York to Cleveland, 1926, 2 hours and 21 minutes; 1925, 2 hours and 52 minutes.

Cleveland to Chicago, 1926, 1 hour and 59 minutes; 1925, 2 hours and 7 minutes.

Chicago to Omaha, 1926, 2 hours and 50 minutes; 1925, 3 hours and 4 minutes.

Omaha to Cheyenne, 1926, 8 hours and 20 minutes; 1925, 8 hours and 20 minutes.

Cheyenne to Salt Lake City, 1926, 2 hours and 40 minutes; 1925, 3 hours and 2 minutes.

Salt Lake City to Reno, Nev., 1926, 3 hours and 27 minutes; 1925, 3 hours and 47 minutes.

Reno to San Francisco, 1926, 1 hour and 36 minutes; 1925, 1 hour and 26 minutes.

The Postoffice Department had discarded the De Haviland type of air plane and at the end of the year was using in its service the Douglas plane.

**AIR COMMERCE ACT OF 1926.** On May 20, 1926, the President approved the Civil Aviation Bill, a general and elastic law which turned over to the Secretary of Commerce and an assistant secretary to be appointed the administration of civil aviation in the United States. This law asserted the right of the Federal government to regulate interstate air commerce and provided for the furthering of air navigation facilities and for the establishment of regulations governing air traffic. It provided for the registration of airplanes and made necessary Federal certificates of air worthiness and pilots' licenses for planes used in a business way and flying from one State to another. It did not regulate flying within one State or flying between States by planes which were not used for business, and for these craft the registration or the obtaining of licenses was made optional. The Government was also authorized to provide aids to navigation in the way of landing fields and airways, and the status of foreign aircraft was defined. As Assistant Secretary of Commerce in Charge of the Bureau of Aviation, W. P. MacCracken, Jr., was appointed.

Late in the year the Department of Commerce issued the final draft of the regulations governing commercial aviation, to become effective on midnight Dec. 31, 1926. The regulations were promulgated after several tentative drafts had been made and studied by those interested. They provided for the registration of all planes used in "Air Commerce" after they had obtained air worthiness certificates, and for the licensing of pilots of registered aircraft. Air traffic rules, signals, and inspections were prescribed, and also penalties for their violation. The rules were quite minute and carefully prepared and will repay study.

Another important feature of the Government's interest in Aeronautics in 1926 was the adoption of the five year programme for the Army and Navy and providing that the Air Corps and the Bureau of Aeronautics should be linked more definitely with the older branches of the two services. The War and Navy departments both were provided with assistant secretaries for Aviation and to these positions F. Trubee Davison and Edward P. Warner were appointed respectively. See **MILITARY PROGRESS**; **NAVAL PROGRESS**.

**MANUFACTURE OF AIRCRAFT.** During the year the U. S. Department of Commerce announced that, according to data collected at the biennial census of manufactures, 1925, the establishments engaged primarily in the manufacture of aircraft built 621 airplanes and 78 seaplanes and flying boats, as against 505 airplanes and 82 seaplanes and flying boats built in 1923, the last preceding census year. The total value of the work done in 1925 by the establishments classified in the aircraft industry was, \$12,277,000. This amount includes \$3,429,000 representing the value of parts and \$882,000 representing the value of miscellaneous products. The total shows a decrease of 5.2 per cent as compared with \$12,945,000 for 1923. Of the 39 establishments reporting for 1925, 14 are located in New York, 5 in Ohio, 3 in California, 2 each in Illinois, Kansas, Michigan, New Jersey, and Pennsylvania, and the remainder in 7 other States.

**COMMERCIAL AVIATION IN EUROPE.** At a conference held at Paris on May 7 between France and Germany, European commercial aviation

was materially advanced through an agreement permitting of reciprocal relations in aviation between the two countries. Reciprocity in the matter of flying over the two territories and liberty of crossing frontiers figured in this agreement, which permitted the opening of air lines between French and German cities and the flight over the respective countries in through flights. This agreement did not in any way supersede the Treaty of Versailles, as the French insisted that the number of military pilots should be kept very low. The coming into effect of the agreement was marked on May 26 by the inauguration of a tri-weekly service between France and Germany, when two French commercial planes left Paris for Berlin and a German commercial plane arrived at Paris from Berlin carrying German air agents who were to be stationed at Le Bourget, the French air port.

During 1926 the following air lines were operating from the Paris air port at Le Bourget: Paris-London, Paris-Brussels-Amsterdam, Paris-Rotterdam-Amsterdam, Paris-Berlin. At Amsterdam connections were made with Hamburg-Copenhagen-Malmö, Hamburg-Berlin, Cologne-Berlin. At Cologne connections were made with Hamburg-Copenhagen, Paris-Strasbourg-Zurich-Innsbruck - Prague - Warsaw - Vienna - Budapest - Belgrade-Constantinople-Angora.

**GERMAN AVIATION.** The progress of commercial aviation in Germany was indicated by the fact that in 1925 fifty-six regular air lines were operating, serving an area of 23,000 kilometers and touching at 61 cities, as compared with twelve lines at the end of 1924, which were operating over an area of 7146 kilometers, touching at 26 towns. In 1924 there were available 24,613 seats for passengers, of which number 13,422 were occupied. In 1925 a total of 107,544 seats were available, of which 55,185 were occupied. In 1925 1,016,600 kilograms of postal letters and packages, freight, and baggage were transported, as compared with 202,806 kilograms in 1924. The total distance flown in 1925 was 7,534,756 kilometers, as compared with somewhat in excess of 2,000,000 kilometers in the previous year.

**AUSTRIAN COMMERCIAL AVIATION.** In 1926 it was reported that aerial traffic in Vienna had shown a decided increase over the preceding year. The number of arrivals and departures from the aerodrome Aspern (Vienna) since 1922, is shown by the following figures:

	Passengers
1922 .....	644
1923 .....	2,548
1924 .....	4,184
1925 .....	6,190
1926 estimated over .....	10,000

To Oct. 20, 1926 no serious airplane accidents had occurred on Austrian territory during 1926 and only two persons were slightly injured during a forced landing. Freight traffic by air in 1926 had advanced substantially, as had also the number of ordinary letters and shipments of gold sent by that method. Up to the end of the year mail had been carried by the ordinary passenger planes. But in 1927 it was planned to introduce the use of special freight planes on some lines.

**ITALIAN COMMERCIAL AVIATION.** In Italy the first commercial air line went into operation on April 1, 1926, when the Società Italiana Servizi Aëria (I.S.A.) established service between Trieste

and Turin making stops at Venice and Pavia, with flights on alternate days. On June 1 daily flights were instituted and the number of planes operated increased from four to eight. The company received a subsidy from the government, both in the form of mileage and for the transportation of mail, and was exempted from various taxes and duties. A second company, the Società Anonima de Navigazione Aëria of Genoa, was formed for the operation of a commercial line between Rome, Genoa, and Barcelona, this company also being subsidized by the government.

**GUGGENHEIM FUND FOR AÉRONAUTICS.** On January 17, Daniel Guggenheim, who in 1925 had given \$500,000 to New York University to establish a School of Aëronautics, announced that he had set aside \$500,000 for a fund to foster the science of aircraft and that he had provided additional sums up to a further \$2,000,000. The fund was organized under a Board of Trustees of ten members and headquarters were opened in New York City. At the first meeting of the Board the following officers were elected: President, Harry F. Guggenheim; and vice-president and treasurer, Rear Admiral H. I. Cone, who was to devote his entire time to the new organization. The field of activity of the fund was divided into four main branches, namely education, scientific research, commercial development, and educational information. The fund proceeded to function immediately, and in the early autumn granted to Leland Stanford University at Palo Alto a sum amounting to the income on \$300,000 for the financing of experiments and study in aviation and aëronautics, providing for the establishment and development of the Daniel Guggenheim Experimental Laboratory of Aëro-Dynamics and Aëronautical Engineering, which would extend the work previously carried on in the aëro-dynamics laboratory of the University. This gift would also provide for the establishment of a full course in aëro-dynamics and aëronautical engineering which would be a division of the School of Engineering on the same basis as the other courses. The Guggenheim Fund also awarded to the California Institute of Technology at Pasadena, \$200,000 for the immediate erection of a permanent fund to be devoted to the study of aëronautics, and grants totaling about \$100,000, to be made over a period of ten years. Here would be given a group of practical courses conducted by the Institute's experimental staff, in coöperation with the engineering staff of the Douglas Aëronautical Company.

Late in the year the Guggenheim Fund announced the appropriation of \$78,000 for the completion of the Aëronautical Laboratory and the establishment of the Daniel Guggenheim Professorship of Applied Aëronautics at the University of Michigan, Ann Arbor, Mich. Of this amount, \$28,000 was to be used to complete the laboratory apparatus and to construct new testing and research instruments, while the remainder was to be paid in installments of \$10,000 a year over a period of five years, for the establishment of the professorship. These gifts would enable the University to complete the work done in its wind tunnel and to install additional equipment.

**AÉROPLANE. See AÉRONAUTICS.**

**AFGHANISTAN**, af-gān'-i-stān'. An independent kingdom of Asia between the parallels 29° and 38° 20' north latitude and 61° and 72°

east longitude with a narrow strip extending to 75° east. The estimates of the area vary from 245,000 to 270,000 square miles. The population according to the latest estimate is about 12,000,000 although some authorities place it at about half that number. Capital, Kabul, with a population of about 100,000. Other important towns are Kandahar, Herat, and Mazar-i-Sharif. The Afghan is the dominant race, and the chief tribes are the Durrani and the Ghilzai, numbering about 2,200,000. The prevailing languages are Persian and Pushtoo, and the dominant religion is Islam.

According to the United States Bureau of Foreign and Domestic Commerce, little is known of the commercial life of Afghanistan. The news which filters across its borders from time to time is not only scarce but often unreliable. Even the transfrontier trade of the country is difficult to ascertain owing to the method of its conduct. Each year, however, Afghanistan is becoming more known among nations, and a gradual awakening appears to be manifest throughout the country. The Amir, in 1926, Amanullah Khan, who ascended the throne in 1919, seemed to be more progressive than his predecessor, and it was probable that under his guidance the nation would break away from its traditional seclusion and would establish more definite connections with the outside world.

Its soil and climate are well adapted to the growing of grain and fruits, and large areas are suitable for the flocks of sheep and goats belonging to its nomads. It is popularly supposed that the country is rich in minerals, including copper, lead, iron, and coal. There are no manufactures and no railroads, although the Khyber Railway from the Indian end of the pass by that name enters the Amir's territory. Motor trucks and camel caravans, chiefly the latter, move the transfrontier trade of the country. For several years the Afghan government, through a representative attached to the government of India, with headquarters at Delhi, superintended the placing of orders for material needed from the outside world. Of late a more conservative practice has prevailed and Afghanistan now buys largely through Kabul, but still strongly favors the Indian middleman, doubtless because of confidence in Indian business procedure and also because of unfamiliarity with modern business practices.

Since 1922 the government of Afghanistan has been a constitutional monarchy with legislative and state assemblies, and a cabinet which is presided over by the Amir himself.

**HISTORY.** Towards the close of the year the press reported that the dispute between Afghanistan and Soviet Russia with regard to the possession of an island in the Oxus River above Balkh had not been satisfactorily settled. The island in dispute was formed during the early part of 1926 by the tides in the river. Afghanistan immediately took possession of it but was driven off by Soviet forces. However, pending settlement, the Afghans were allowed to regain possession of the island.

**AFRICA.** The various divisions of Africa in this volume are discussed under their own heads. engaged in farming. Small classes were organized by the county agricultural organizer and were conducted by him or some member of his staff.

In April, 1926, young farmers' clubs were organized in 20 counties and dealt with a variety of subjects. In East Sussex County a *Boys' and Girls' Poultry Club Journal* was published. In July, 1926, there was an international dairy cow judging contest between calf clubs of England and America. In Staffordshire teachers for classes in home economics were provided.

CANADA. In the several provinces extension work was continued by public agents and through short courses at colleges and boys' and girls' clubs. In British Columbia much attention was given to pig, calf and poultry clubs. These were conducted under the supervision of the livestock and poultry branches of the provincial department of agriculture with the assistance of district agriculturists and supervisors of elementary agricultural education. In Saskatchewan special attention was given to pig clubs supervised by the university extension department, with the aid of the agricultural societies. An inter-club competition was held at the university and the winning team was given a trip to the "Toronto Royal," as the guests of the Canadian National Railways.

For adults the better bull campaign was successfully continued under direction of the livestock branch of the provincial department of agriculture. Purebred bulls and hogs carried on extension trains were sold to farmers and their scrub bulls were accepted in part payment. The agricultural societies were provided with two lecturers in the winter and there were also some special lectures and demonstrations on the bacon hog industry. Radio lectures by members of the agricultural college faculty were broadcast. In Alberta the women's home bureau service of the department of agriculture furnished short courses in home economics at the request of women's institutes, girls' clubs and other organizations. The millinery courses were especially popular.

In New Brunswick a short course for leaders in women's institutes work was given at the agricultural school at Fredericton during February. The branch institutes paid the expenses of representatives attending this course but others were also admitted. Instruction was given in home economics, dairying, bee-keeping and poultry.

UNION OF SOUTH AFRICA. Control of the schools of agriculture was transferred to a division of education and extension in the Department of Agriculture in November, 1925. Eight extension officers and one senior officer were at work during the year and a special organizing officer was added to the field staff. There were also four home-economics officers. Extension tours, farmers' weeks, demonstration trains and fairs were special features of the work. A women's section of the Transvaal Union was formed, with membership in existing farm associations or in independent associations.

INDIA. The agricultural departments of the various provinces continued to employ extension workers in coöperation with agricultural associations, coöperative societies and other agencies.

FRANCE. The extension organization under the Ministry of Agriculture included inspectors-general in the eight agricultural regions, di-

rectors of agricultural services in the several departments (counties), and professors of agriculture or special subjects. Work in agriculture and home economics for women and girls was continued. Agricultural associations also carried on much extension work.

BELGIUM. The Ministry of Agriculture continued to carry on extension work through numerous specialists in agriculture, veterinary medicine, forestry and farm housekeeping.

DENMARK. Extension work continued to be carried on by the Department of Agriculture, the Royal Agricultural Society, and about 120 local farm organizations.

THE NETHERLANDS. The Department of Agriculture carried on extension work through Inspectors of Agriculture. Advisers in agriculture and horticulture were located in the 11 provinces, together with specialists in dairying, animal husbandry, poultry and bee-keeping.

SWEDEN. Extension work was carried on by the 26 county agricultural societies, subsidized by the general government. In 1924 these societies had 663 sections and a total membership of 102,847. The extension forces of the societies numbered 232 advisers and experts. In addition, there were specialists employed by Government. The young farmers' league, which in a general way corresponds with the boys' and girls' club organizations in the United States, began in 1918 and had 232 groups with 10,300 members in 1925. About 200 competitive projects were conducted that year, including growing of root crops, kitchen gardens, plowing, millinery, domestic arts, etc., in which 2120 members took part.

SWITZERLAND. The Swiss Peasants' Union conducted extension work through traveling lecturers who also gave oral and written information on agricultural subjects.

GERMANY. Before the war the provinces of Prussia conducted many itinerant schools of rural housekeeping with courses of from 8 to 12 weeks but in recent years the expense of such schools has greatly reduced their number. Some objection to them also arose because in many cases they did not give the women instruction in agricultural subjects. The Chamber of Agriculture of Wiesbaden therefore decided in 1920 to give up such schools and substitute for them "parallel classes" for girls in the winter agricultural schools, which had been exclusively for young men.

Similar schools were held in the provinces of Brandenburg, the Rhine province, Saxony and Silesia. The classes proved so successful that in 1924 the Minister of Agriculture publicly commended them. The State subsidy was withdrawn from the itinerant schools and given to the parallel classes. However, the itinerant schools have many friends because they reach relatively large numbers of girls, who can live at home while attending them.

In Silesia courses of 14 days or more in mending linen and clothing were given under the auspices of the Federation of Farm Housewives' Societies. Fees of students met the expenses. The sessions lasted four hours in the morning or afternoon and each class was limited to 15 persons. In Hesse a farm housewives' society organized a two weeks' course in home economics and agriculture to train young women for leadership in their villages. So many girls applied for this course that it was necessary to get contribu-

tions from the government and other sources. In Bavaria among the courses held by the agricultural bureaus instituted by the government to act as advisory bodies for the farmers, those in farm mechanics were especially popular. They covered a week in the latter part of May. Each class was limited to 15 or 20 persons.

ITALY. The courses in agriculture for young peasants from 13 to 17 years old, provided for in the decree of April 3, 1924, were in operation in all the 120 provinces in 1926. The motion picture films of the National Cinematographical Institute were widely used and covered a considerable number of subjects. The prevalence of the eight-hour work day in Italy created new problems connected with the use of spare time. The Confederation of Fascists Corporations promulgated a scheme to meet the needs of old and young workers, including farm laborers. By a decree of May 1, 1925, the National Institute of Workers' Spare Time Employment was created, and put under the general control of the Ministry of National Economy. It received a subsidy from the Government and contributions from public administrative bodies, corporations and individuals. It encourages popular instruction, including agriculture and home economics, fixed and traveling libraries, motion pictures, radio broadcasting, excursions, exhibits, and many kinds of out-door and in-door social gatherings and recreations.

MEXICO. Extension work under the Bureau of Indigenous Culture of the Department of Education was carried on for several years in the remote and isolated regions among the Indian people. A special force of extension workers, known as "missionaries" get into close touch with the people and hold classes for adults and children. Elementary instruction in the fundamentals is given as well as in agriculture, home economics and modern social customs. Classes are first held outdoors in some clearing or in a hut. Then the people are encouraged to build "a people's house." In 1925 there were 400 such community centres in Mexico. After the "missionaries" have done the pioneer work extension specialists follow them to teach soil improvement, better designs for pottery and serapes, improved weaves of cloths and blankets, etc. In 1925, 120 missionaries and 600 specialists were employed. Consult *Report of the Director of the Extension Service, 1926*, by C. W. Warburton (U. S. Department of Agriculture).

**AGRICULTURAL LEGISLATION.** Aside from the annual act making appropriations for the support of the Federal Department of Agriculture, which is discussed elsewhere (See *AGRICULTURE, U. S. Department of*), the most important legislation to be completed during the year was an act signed July 2, 1926, establishing within the Department of Agriculture a division of coöperative marketing. This division was empowered to obtain and disseminate information regarding the organization, progress, and business methods of coöperative associations in the United States and foreign countries, including studies of the economic, legal, financial, social, and other phases of coöperation. It may also, upon request, make surveys and analyses of the business practices of representative coöperative associations, and may confer and advise with groups of producers desirous of forming a coöperative association. It is authorized further to "acquire from all available sources information

concerning crop prospects, supply, demand, current receipts, exports, imports, and prices of the agricultural products handled or marketed by coöperative associations, and to employ qualified commodity marketing specialists to summarize and analyze this information and disseminate the same among coöperative associations and others," and, in short, "to promote the knowledge of coöperative principles and practices and to coöperate, in promoting such knowledge, with educational and marketing agencies, coöperative associations, and others."

Another section of the act provides that "persons engaged, as original producers of agricultural products, such as farmers, planters, ranchmen, dairymen, nut or fruit growers, acting together in associations, corporate or otherwise, in collectively processing, preparing for market, handling, and marketing in interstate and/or foreign commerce such products of persons so engaged, may acquire, exchange, interpret, and disseminate past, present, and prospective crop, market, statistical, economic, and other similar information by direct exchange between such persons, and/or such associations or federations thereof, and/or by and through a common agent created or selected by them." This clause is, of course, general legislation and was evidently incorporated to relieve associations of this type from liability of possible prosecution for alleged conspiracy in restraint of trade.

Fully two score of other measures designed to afford relief to agriculture along economic lines were introduced during 1926, and a number of these were earnestly considered, but upon adjournment of the first session on July 3 the wide differences in opinion which had developed had precluded additional legislation. In the House favorable reports were authorized by the Committee on Agriculture on three measures dealing with the problem of the agricultural surplus, the so-called McNary-Haugen, Curtis-Aswell, and Fess-Tincher bills, but of these the first named was rejected by a vote of 212 to 167 on May 21, and efforts to substitute others proved unsuccessful. In the Senate a modified form of the McNary-Haugen bill was attached by the Committee on Agriculture and Forestry to the coöperative marketing bill, but it was eliminated during the consideration of that measure, by a vote of 45 to 39 and all attempts to incorporate other plans likewise failed.

Upon the convening of Congress in December for its second session, the agricultural situation was discussed sympathetically and in some detail by the President in his annual message. As regards the vexed question of the surplus, he made no specific recommendations but pointed out that "the problem urgently demands a solution. Discussions both in and out of Congress during the past few years have given us a better understanding of the subject, and it is my hope that out of the various proposals made the basis will be found for a sound and effective solution upon which agreement can be reached. In my opinion coöperative marketing associations will be important aids to the ultimate solution of the problem. It may well be, however, that additional measures will be needed to supplement their efforts. I believe all will agree that such measures should not conflict with the best interests of the coöperatives, but rather assist and strengthen them. In working out this problem to any sound conclusion it is necessary to avoid

putting the Government into the business of production or marketing or attempting to enact legislation for the purpose of price fixing. The farmer does not favor any attempted remedies that partake of these elements. He has a sincere and candid desire for assistance. If matched by an equally sincere and candid consideration of the different remedies proposed, a sound measure of relief ought to result. It is unfortunate that no general agreement has been reached by the various agricultural interests upon any of the proposed remedies. Out of the discussion of various proposals which can be had before the Committees of Agriculture some measure ought to be perfected which would be generally satisfactory."

In the short interval before the Christmas recess of Congress on December 22, no action was taken other than the introduction of many additional bills in both houses. One of these, sponsored by Senator McNary and Representative Haugen, was a more or less radical modification of the earlier McNary-Haugen bills, aiming to stabilize farm prices through a control of the surplus but omitting all reference to price levels and price standards. Under its provisions a separate "stabilization fund" is provided for each of the five commodities, cotton, wheat, corn, rice, and hogs. These stabilization funds would be obtained by levies on the "marketed units" of each commodity and would be employed in "removing or withholding or disposing" of the surplus by coöperatives or, if there are no co-operatives available, by individuals engaged in processing such commodities. No public funds would be used directly in effecting such control, but loans to be repaid with interest would be made from a revolving fund of \$250,000,000 to the several commodity stabilization funds in anticipation of the collection of the equalization fees imposed upon each marketed unit. Vigorous attempts to secure the passage of a measure along these lines early in 1927 were anticipated through the aid of a combination of the agricultural representatives of the West and South, but in view of expected continued opposition from industrial centres its passage within the eight weeks remaining before the expiration of the Congress seemed somewhat uncertain. However, it was confidently expected that President Coolidge would veto such a measure, if it was passed by Congress.

Despite the appointment early in 1926 of a Joint Committee on Muscle Shoals and its report on April 26, 1926, the question of the possible utilization of this equipment for the manufacture of fertilizers from atmospheric nitrogen was still undecided. Provision was made, however, for a five-year investigation by the Secretary of the Interior and the Secretary of Commerce of the potash deposits of the United States.

Legislation authorizing the formulation of a leasing system on the unappropriated public domain for grazing purposes and the adoption of a uniform grazing policy was still being sought. Various proposals looking toward the modification of the laws governing the collection by various agencies of the Federal Government of crop statistics, especially as to cotton, were being made. There were also pending the usual number of minor matters, but little progress was evident toward their enactment.

Only a few State legislatures were in session in 1926, and but little legislation was enacted.

The seed inspection laws of Louisiana, Rhode Island, and Virginia were amended, as were also the apiary inspection law of New Jersey, the feeding stuffs law of Ohio, the fertilizer law of Virginia, and the milk inspection law of Rhode Island. Kentucky passed a new law for nursery stock inspection, South Carolina required the licensing of nonresident nurserymen, and New Jersey safeguarded purchasers of nursery stock guaranteed to be true to name by requiring dealers to file duplicate contracts with the State secretary of agriculture.

A fruit and vegetable inspection and grading law was enacted in Louisiana. Massachusetts revised its apple-grading law to secure uniformity with the other New England States, and Michigan established standards for apples and grapes.

Drastic quarantine regulations against the European corn borer were authorized in Michigan, while New Jersey strengthened its law against contagious abortion of cattle and Rhode Island and Ohio their bovine tuberculosis laws. Louisiana regulated more stringently the slaughtering of cattle.

Ohio amended its laws for the regulation of co-operative marketing associations, and Louisiana its law for the licensing of commission dealers.

**AGRICULTURE.** The outstanding feature of the year 1926 in the United States was the immense cotton crop and the attendant slump in prices which resulted in a severe setback to southern farmers. It interrupted the moderate improvement in the agricultural situation which had been in progress since the depression period of 1920-21. The early estimate during the summer of something over 15,000,000 bales was increased in December to upwards of 18,600,000 bales. This was much the largest crop ever harvested in the United States. A record acreage was planted, and although the spring and early summer were cool, after the first of August the crop was favored by warm weather and a continuation of favorable weather conditions into the late fall, which extended the time of picking. Production was 16,103,679 bales in 1925, and 13,627,936 in 1924. There was a carry-over into the season of 1926 of 5,000,000 bales, which went to swell the large supply produced in that year.

To meet the situation the President appointed a Federal Commission consisting of the Director of the War Finance Corporation and the Secretaries of the Treasury, Agriculture, and Commerce, and the Government announced it would extend \$30,000,000 in credits to southern planters. The Commission made a survey to determine to what extent cotton countries of Europe could be induced to make long-time purchases, urged the domestic spinning industry to do the same, encouraged the movement of southern bankers to stand back of relief measures, and advised a restriction in acreage of the 1927 crop. Other agencies in the Southern States proposed to withhold from the market 4,000,000 bales for a period of 18 to 20 months and to secure a reduction in acreage of 25 per cent. Meetings were held throughout the South for this purpose, and many of the States entered into the proposed provisions.

Generally speaking the position of agriculture at the close of the year was better than it had been in any year since 1920. Livestock raisers, dairymen, and winter wheat growers earned good returns, and underlying conditions in the corn belt improved. Since 1920 every agricultural sec-

tion and every important branch of agriculture have made progress, although this has not been without reverses, and not all groups of producers have shared equally. For the crop year 1925-26, there was a decline in value of the leading farm crops of \$1,148,000,000 as compared with the preceding year, more than half of it due to the fall in cotton prices. The net return on the value of the capital invested in agriculture was calculated at about 4.5 per cent, compared with only .6 per cent in the crop year 1920-21. Over much of the country farmers were still struggling with a burden of debt and reduced buying power. The purchasing power of farm products in terms of nonagricultural commodities was about 85 per cent in the early fall, on the basis of the pre-war average, and declined somewhat later. Returns of the Department of Agriculture indicate that, with the allowance of a conservative interest on investment, the average farm family earned \$648 for labor and management, which is nearly 30 per cent below the earnings of 1919-20.

**DEMAND FOR RELIEF.** Dissatisfaction with the share agriculture was receiving in the general business prosperity continued with little abatement during the year. Various regional conferences of farmers and their organizations were held to consider the economic situation of farming and what was needed to remedy it. There was demand for legislation, which Congress had failed to provide although various measures were considered. There was much talk about the need for formulating a new agricultural policy, but no definite policy was agreed upon, and there was lack of uniformity as to the form of relief measures. Among changes suggested were a readjustment of the tariff schedule in order to extend more direct benefits to the farmers, better and more elastic credit facilities, a moderate revision of the immigration laws, reduction of local and State taxes, more economic distribution of products, and some provision for stabilizing prices which the farmer may receive for his products. The provision of funds for taking care of surpluses, especially for marketing these abroad, was one of the means advocated for restoring prices to a parity with pre-war averages.

Heavy debts contracted in a period of high prices, together with comparatively low returns in recent years, had resulted in bankruptcies and had perpetuated the distress among farming people. It was pointed out that one cause of the difficulty was found in the system and practice of local banking in its relation to the inflation of land values and the piling up of farm debts before the close of 1920. The extent of bank loans on land in excess of its present value had thrown many country banks into bankruptcy and put upon others the dangers of mortgage foreclosure. To this was attributed, in part at least, the interest of bankers in some measure for farm relief which would raise farm values. The economic and political background of the movement was apparently very complex. While it was generally admitted that agriculture was not upon the proper basis and was entitled to the same opportunities as were extended to other industries, hope of solving the problem in the political arena was evidently somewhat on the wane.

On the other hand, the interdependence of the industries and agriculture had aroused the interest of a wider circle. Agriculture supplied raw materials for factories that gave employment to at least half of the laboring population, and it

was estimated that agriculture's purchases of manufactured goods amounted to \$6,000,000,000 a year, while its entire purchasing power, including transportation and other services, was fully \$10,000,000,000. Hence marketing systems that will enable farmers to realize more from their products without injury to others were seen as the practical means of relief.

**THE CROP YEAR.** Generally speaking, total crop production of the year was above average in quantity but below average in quality. Total production of all crops apparently was about 3 per cent larger than in 1925, and the per capita production in 1926 about 2.4 per cent above the per capita production for the previous five years. The composite quality of 15 important crops, exclusive of cotton, fruit, winter wheat, and sweet potatoes, was about 5 per cent below the last 10-year average. There was a good crop of wheat, and its value was about \$39,682,000 greater than 1925 although in parts of the spring wheat sections yields were reduced by drought, the spring crop being practically a failure in much of South Dakota and Central North Dakota. The total crop of all wheat was estimated at about 832,000,000 bushels, an increase of 156,000,000 over 1925, and also above the 5-year average. The corn crop of 2,645,031,000 bushels was about 6 per cent below the average and was reduced by relatively early frosts and by excessive rains in the North Central States. Corn prices were low enough to encourage feeders. The balance between corn production and hog production was improved and, although there was no undue surplus of corn as there was in 1925, there was sufficient to fatten an increased number of pigs.

The oat crop was slightly below the average but was produced on an increased acreage. The estimate was for 1,253,739,000 bushels. The barley crop of 191,182,000 bushels was slightly above the 5-year average, while that of rye was less than two-thirds of the average, owing largely to progressive reduction in acreage but partly also to subnormal yields. The hay crop was slightly above the relatively short crop of 1925 and considerably below the average. Potato acreage increased only moderately over the relatively small acreage of 1925, but the yield was slightly above the average, giving a total production of 357,800,000 bushels. Production of sweet potatoes was one-fourth greater than last year but still slightly below the average. The tobacco crop was an average one. Although the production of cigar type tobaccos was below the average, that of the cigarette types was larger but not above the trend of present consumption needs. There were large crops of fruit, that of apples being above the average in nearly all sections of the country and the total the largest in over a decade. See articles on the individual crops.

In spite of a common belief to the contrary, the U. S. Department of Agriculture reported that crop yields per acre had been rising steadily in the previous forty years. Since 1885 the average yield per acre of corn had increased 18 per cent; that of wheat 17 per cent; of oats 14 per cent; and of potatoes 39 per cent. In the same period the combined acreage of these four crops had increased about 52 per cent and the total quantity produced had increased 72 per cent. Most of these increases in acre yields had occurred in the older regions east.

of the Mississippi, which is contrary to the idea that the farm lands of the longer settled parts of the country have become worn out or less productive. A recent survey of the States of New York and New Jersey showed that they constitute a rich farming section with an annual income greater than that of Ohio, Indiana, Missouri, Wisconsin, Minnesota, Kansas, or Nebraska. Only one State east of the Mississippi, namely, Illinois, exceeds the combined farm income of these two States, and in the whole country only four outrank it. The income per farm is relatively high in this eastern area, and the percentage of farms operated by owners is larger than in any other section.

**DECREASE IN HARVESTED AREA.** In the five years ending with 1925 the total area of harvested crops in the United States had decreased 19,000,000 acres, equivalent to 5 per cent of the cultivated area, the land having reverted to pasture or woodland or been allowed to lie idle. This was the first Census period in the history of the country to report such a falling off in acreage. The decreases occurred principally in the eastern cotton belt, in the corn and winter wheat belt, the eastern and southern part of the corn belt, the hay and dairy region from Lake Michigan to the Hudson Valley, and in Eastern Washington and California. It was attributed to the agricultural depression of the five year period. This reduction in cropped land occurred despite an increase in population of nearly 8 per cent.

Likewise a continued decrease in farm population was reported by the Department of Agriculture in 1925, amounting to 479,000 persons, including men, women, and children living on farms. There was a gross movement away from the farms of about 900,000 persons, but the large increase of births over deaths helped to offset the loss due to cityward movement. In 1924 the net movement from farms to towns and villages amounted to 679,000 persons.

**AGRICULTURAL SURPLUSES.** Much attention was attracted to the surplus problem and its relation to the farmers' present difficulties. The problem, however, of surpluses and shortages was not merely one growing out of readjustments following the war, but had been of periodic occurrence. When agriculture was a home industry, producing for home consumption, there was no problem of surpluses. But the question had grown up with the practice of production mainly for the market. Its seriousness was intensified by the fact that in the case of many agricultural products the supply was extremely inelastic and hence a change in supply results in a relatively greater change in wholesale price. Hence surpluses of various crops unquestionably exercise an influence on prices entirely disproportionate to their amount. This is seen whenever the production of a crop reaches proportions in excess of the country's demand and particularly at a given time, as when large proportions of the crop are being marketed. Contrary to popular view, the size of the surplus is not indicated by the amount offered for export, although foreign demand and export serve to reduce the effect of a surplus over local needs. Surpluses occur, however, in products which are not exported to any considerable extent, as in the case of corn, and a reasonable surplus or carry-over of nonperishables like cotton is a safeguard tending to equalize prices.

It is contended, therefore, that the farm problem is not merely a question of disposing of temporary oversupplies. The belief that it is has led to various proposals that the Government take over the surpluses, removing them from the local market and providing for their export or otherwise neutralizing their action on prices. But such proposals have not been held economically sound because they relieved producers from responsibility in controlling their production and would be likely to impose a very heavy financial burden on the general Government. Such governmental action would tend to interfere with the law of supply and demand which, in relation to production, is expressed in curtailment when production becomes unprofitable and resumption or increase when it again becomes profitable. Two suggested avenues of approach are through a better adjustment of production to market requirements—the difficulties of which are realized but not believed to be insurmountable—and through a better control of the movement of products into consumption channels. To accomplish more orderly marketing would require adequate marketing, storage, and credit facilities, and the organization of producers to act together in their marketing operations. Such an orderly flow of products to market, it is thought, can best be effected by farmer-controlled agencies, especially through centralized selling as a result of consolidation of existing coöperative associations along commodity lines. See also AGRICULTURAL LEGISLATION.

**AGRICULTURE ABROAD.** Agricultural production in Europe outside of Russia had practically recovered from the effects of the War. In some lines it had increased, while in others it remained somewhat less than formerly. In 1925 production of the principal food crops, wheat, rye, and potatoes, was greater than the pre-war average, 1909–13. In 1926 the wheat and rye crops were not so large, but the potato crop and such feed crops as barley, oats, and corn, were larger than the pre-war average. The area planted to the principal crops in all European countries exclusive of Russia remained about 5 per cent below the pre-war average.

Preliminary estimates of the world production of grain crops and potatoes, exclusive of Russia, indicated a reduction with the exception of wheat, which in the Northern Hemisphere was about equal to last year's crop. In early December the indications were that the world wheat crop would be increased over the previous year. The crops of Australia and Argentina were both larger. The total production in the Southern Hemisphere promised to be about 50,000,000 to 80,000,000 bushels greater than in 1925. The Canadian wheat crop was estimated at about the same as in 1925.

Owing to the increased cotton crop of the United States, the world's crop of that fibre was expected to be larger even than in 1925, which was a record crop. The world's consumption of cotton in that year was greater than in any previous year, but not equal to the production, thus leaving a large carry-over to 1926. The prospect was that consumption would not take care of the new crop so that stocks might be greater at the end of the year than at the beginning. The estimate of the world's sugar crop for 1926–27 by Willett and Gray was slightly less than production in the year 1925–26. The de-

PRODUCTION BY COUNTRIES IN 1925 AND 1926 OF WHEAT, RYE, OATS, BARLEY AND MAIZE IN BUSHELS

crease applied to both the cane and beet crops.

The table on page 25 gives the production in the principal countries of the world as far as available at the close of the year.

**GREAT BRITAIN.** Farming conditions in England showed little if any improvement, and especially no gain in confidence in the future of arable farming, for a further decline of 134,000 acres of cultivated land was recorded, as compared with 1925. The country had therefore nearly half a million acres less under cultivation than before the outbreak of the War, and two million acres less than in 1918. Wheat was the only cereal crop which showed any increase in acreage, while that of barley decreased and that of oats remained unchanged. The area under sugar beets more than doubled. This change from cultivation to laying down in pasturage was reflected in the increase in cattle, the number being the greatest ever recorded and representing an increase of nearly three-fourths of a million in the past five years.

British farming was definitely suffering from undercapitalization. Apparently there is a wide gap between the social valuation of land and its earnings or economic capacity. It was commonly reported that land was paying only 2 per cent on what it was supposed to be worth. Under the circumstances which have prevailed since the war, landlords have found it impossible to continue to maintain the credit requirements of agriculture. The condition has affected tenants so that the landlord, the tenant, and the laborer are all suffering from lack of capital, high taxes, and reduction of income.

**FRANCE.** In France there was a return during the year to the war-time measures of saving wheat. It was decreed that bread flour must contain 8 per cent of rye and, when that is not obtainable, rice, barley, or corn substitutes are required. The object was to try to steady the constantly mounting price of bread and to tide over the period until the 1926 harvest without having to import foreign wheat. Production, however, showed a decrease. An embargo was placed on the export of French wheat except a small amount for seed purposes. The small parcels into which land has been cut up in France is shown by a statement from official sources that nearly 4,000,000 of the 5,703,000 landowners in that country possess less than 25 acres each. Only about 30,000 have 250 acres.

**JAPAN.** By imperial decree the Japanese Government made effective the legislation pending since 1910 granting to foreigners the right to own land in Japan. Heretofore they had been able only to lease under certain restrictions.

**AGRICULTURAL EXPORTS AND IMPORTS.** The value of the exports from the United States of agricultural products, excluding forest products, was 17 per cent less in 1926 than in 1925 but remained larger than in any other year since 1920-21. In percentage of total exports there had been a steady decline. In 1901 agricultural exports constituted 65.2 per cent of the total exports. By 1913 the proportion had dropped to 43.6 per cent, but immediately following the War it rose to over 50 per cent. Following the War there was a downward trend, the proportion being 44.2 in 1925 and 40.6 in 1926, the lowest ever recorded except in the war years 1916-18. On the contrary, exports of industrial products have increased since the War. The latter amount to nearly 10 per cent of the manu-

facturing and mining output, compared with about 13 per cent of the production of farms. Cotton stands first in value among all agricultural exports. Imports of agricultural products, exclusive of forest products, amounted to \$1,918,000,000 during the year. Many of these competed directly with American-grown products; for example, sugar, \$232,000,000; wool and mohair, \$125,000,000; hides and skins, \$94,000,000; tobacco, \$60,000,000; dairy products, \$31,000,000; and flaxseed and flaxseed oil, \$40,000,000.

**FOOD AND POPULATION.** From time to time the relation of food production to increasing population was given attention by economists and publicists in long-range predictions, usually leading to the suggestion of ultimate food shortage as a limiting factor in the growth of population. Sir Daniel Hall presented such a discussion before the British Association, which, on account of his prominence, attracted quite wide attention.

It was estimated that under present conditions of farming about 2½ acres of cultivated land were employed for the maintenance of one unit of population, man, woman, or child. The area varies in different countries according to the quality of the land and the system or intensity of agriculture followed. It is as low as 1½ acres in Denmark with its intensive cultivation, and as high as 4 acres in Spain, with its great areas of poor pasturage. There is held to be a definite limit to the land suited to cultivation, which is being approached. On the basis of an increase of white population of the world amounting to 5,000,000 annually, Sir Daniel estimates that 12,000,000 acres of cultivated land per year will be needed to supply the food requirements of this increase if present conditions are maintained. He anticipates that the white races will insist on maintaining their rising standard of living, and since the possible expansion of farm area is restricted he considers that the needed increase in production is largely dependent on increasing the acre yield. This means higher costs, except as it can be accomplished by the application of science—improvements due to the plant breeder, more effective methods, more adequate use of machinery, the cheapening of fertilizers, etc. Greater intensification of production is held to be dependent largely on stimulation through rise in prices of agricultural products or securing a larger relative return to the farmers for their efforts.

On the other hand, those who have expressed greater confidence in the ability of agriculture to take care of increasing population pointed to the large opportunities still open for the expansion of farming, especially in undeveloped regions of Africa, Australia, the South American countries, and parts of the United States, the extent to which the area of such food crops as wheat and corn had been extended in the colder countries, and the possibility for increasing farming efficiency. It had recently been estimated by the Farmers' National Council that American agricultural and forest resources were sufficient to maintain a domestic population of 312,000,000, and, with intensive development, would maintain 519,000,000. The Secretary of Agriculture in his last annual report for 1926 called attention to the great variation in efficiency of production on different farms. Some dairy farms produced 100 pounds of milk with one dollar's worth of feed, while on other farms two dollars'

worth of feed was required. On some farms a bale of cotton was produced with 200 hours of labor, while on others where natural advantages are just as great 300 hours were required. Some hog raisers make 100 pounds of pork for every 250 pounds of grain fed to hogs, while other raisers require more than 500 pounds of grain for the same purpose. The American farmer on the average was feeding himself and ten other persons at the present time. This could be increased by greater efficiency of production, which is economically possible. The Secretary maintained that efficiency does not necessarily mean maximum production per acre nor production at the lowest cost per unit. The farmer is most efficient who uses the methods that will give him the greatest returns from his farm as a whole, which calls for attention not only to the cost of production but to the quality and volume of the things produced.

**COÖPERATION IN AGRICULTURE.** Much emphasis continued to be laid on coöperation as a means of improving the economic position of the farming people and advancing the interests of rural living. The number of farmers' coöperative associations has increased from less than 6000 in 1915 to approximately 12,500 in 1926. The membership of these coöperatives has more than trebled since 1915, having reached a total of approximately 2,000,000. During this same period the volume of business had grown from \$635,800,000 to an approximate total of \$2,400,000,000, a four-fold increase which represents one-fifth of the agricultural products of the country.

There is a close relationship between the intermediate credit banks and the coöperative movement. More than half the loans of these banks have been made to farmers' coöperative marketing associations, nearly \$125,000,000 having been so loaned last year, to finance production as well as marketing. The availability of this resource has had the tendency to make it easier for the coöperatives to get credit from commercial institutions, and on better terms. During the year, provision was made by Congress for the establishment of a Division of Coöperative Marketing in the Bureau of Agricultural Economics, to enable the Department of Agriculture to conduct research studies and furnish service which will aid in the development of the coöperative movement. See also **AGRICULTURAL LEGISLATION.**

The Secretary of Agriculture devoted a large amount of space in his report for this year to matters relating to coöperation, pointing out the causes of failure, the primary essentials of success, and the possibilities of large expansion. The coördination of local coöperative units was advocated, in order to provide a stronger central sales agency and to give more effective bargaining power. It was believed that there should be separate organizations for each leading commodity, rather than having wheat growers, cotton growers, fruit growers, and livestock raisers all in the same organization. The opportunity open to large-scale, efficiently managed coöperatives is three-fold: (1) standardizing grades and handling methods; (2) development of an effective merchandising programme; and (3) supplying the farmer with information regarding the market conditions sufficiently far in advance so that he may make adjustments in his production programme.

In Canada, likewise, coöperative organizations were making rapid growth and organizations of great magnitude, such as the wheat pools, were functioning successfully. The Canadian wheat pool, with its three units in the Provinces of Manitoba, Saskatchewan, and Alberta, established three years previously, was said to be the largest coöperative organization of its kind in the world, with a membership of over 125,000 farmers controlling about 14,000,000 of the 21,000,000 acres sown to wheat in the three provinces. The Canadian wheat pool handled the sale of the greater part of the wheat product of Canada. Most of it was sold by a central selling agency to importers and buyers in different countries, the agency having its own representatives in fifty-one ports of the world. Progress was also being made in the coöperative selling of livestock. The Saskatchewan livestock pool and hog pool have been united under one management, and it was expected the association would handle 1000 cars the coming year. See also the articles on the different crops, **HORTICULTURE, FORESTRY, LIVESTOCK, DAIRYING, FERTILIZERS, SOILS, ENTOMOLOGY, ECONOMIC, VETERINARY MEDICINE, FOOD AND NUTRITION, etc.**

**AGRICULTURE, UNITED STATES DEPARTMENT OF.** Dr. William Marion Jardine of Kansas, in 1926 continued to be Secretary of Agriculture, with Renick W. Dunlap as Assistant Secretary. Dr. Albert F. Woods, president of the University of Maryland and formerly Assistant Chief of the Bureau of Plant Industry, was appointed Director of Scientific Work. On June 30, 1926, the personnel of the Department was 20,742, of whom about 4700 were located in Washington.

The report of the Secretary for 1926 dealt largely with the economic conditions of agriculture in the United States, including the surplus problem, developments in coöperative marketing, farmers' taxes, and the relation of the tariff to agriculture.

**COÖPERATIVE MARKETING.** An act of July 2, 1926, created a division of coöperative marketing in the Bureau of Agricultural Economics. Its objectives are research designed to test existing business and marketing methods, education in the principles and practice of coöperation and the service of a fact-finding agency to the coöperatives. Studies were begun on the coöperative marketing of cotton, grain, livestock, fluid milk, fruits and vegetables. Coöperative associations reporting to the Department at the end of 1925 had about 2,000,000 active members in various organizations. Their annual business totaled about \$2,400,000,000.

**WEIGHING LIVE STOCK.** By an Act of May 6, 1926, the packers and stockyards act was amended to permit the Secretary to register as a market agency any authorized State department or agency for weighing livestock received at a stockyard. The Packers and Stockyards Administration dealt with 78 stockyards, about 5600 market agencies and dealers and 850 packers. Progress was made in the enforcement of the Grain Futures Act. The important exchanges created business-conduct committees with broad powers over the transactions in futures.

**PLANT QUARANTINE.** A decision of the Supreme Court of March 1, 1926, that, with the Federal plant quarantine act in force, State action is illegal, invalidated over 200 State quarantines. To remedy this an amendment to that act, ap-

proved April 13, 1926, authorized the Secretary of Agriculture to cooperate with any State, Territory or district in the enforcement of quarantines and authorized the State to exercise its police powers with respect to articles shipped in violation of a Federal plant quarantine.

**ROADS.** During the fiscal year ended June 30, 1926, 9,417 miles of road were completed under the Federal Road Act of November 9, 1921, making a total of 55,903. In addition, 10,962 miles were under construction. The total cost of the projects completed during the year was \$206,139,220, of which \$90,294,107 was paid by the Federal Government. The total Federal-aid funds apportioned to the States during 10 years were \$671,375,000. Ten years previously only 5 States had an improved road across the State, while in 1926 25 States had such a road. Within and adjacent to the national forests there were forest highways aggregating 13,459 miles, of which 10,954 miles were in 11 Western States. With Federal funds of the Bureau of Public Roads 622 miles of forest roads were completed during the fiscal year 1926, making the total 3045 miles.

**EXPENDITURES.** For the fiscal year 1926 the total expenditure for the regular work of the Department was \$44,576,388. Approximately \$10,300,000 was used for research; \$2,300,000 for extension work; \$9,300,000 for eradication or control of plant and animal diseases, insects and other pests; \$12,900,000 for service activities, and \$9,700,000 for regulatory work. Funds amounting to \$5,486,616 were received and deposited in the Treasury, of which \$4,641,415 was from business in the national forests. The other funds administered by the Department aggregated \$121,189,272, of which \$98,715,362 was for Federal-aided roads and forest roads and trails; \$2,400,000 for experiment stations under the Hatch, Adams and Purnell Acts; \$5,880,000 for extension work under the Smith-Lever Act, \$1,271,275 for local road and school purposes, and \$1,025,495 for forest purchase and conservation under the Weeks Act.

**APPROPRIATIONS.** The Appropriation Act of May 11, 1926, for the fiscal year ending June 30, 1927, carried \$127,924,573, of which \$80,000,000 was for roads. The amount available for the regular work of the Department was \$47,924,573. The net increase of \$2,200,000, included \$1,100,000 additional for payment of indemnities to farmers in connection with tuberculosis eradication work. To this must be added permanent appropriations, including \$4,580,000 for extension work under the Smith-Lever Act, \$3,000,000 for meat inspection, \$1,440,000 for experiment stations under the Purnell Act, and \$3,771,250 for various forestry purposes. The total available for the Department in 1927 was \$139,275,823.

**BUILDINGS.** Under the public buildings act of May 25, 1926, granting \$50,000,000 for buildings in the District of Columbia during the next five years, it was expected that over \$8,000,000 will be used for buildings for the Department of Agriculture.

**PUBLICATIONS.** For the fiscal year 1926 the Department issued 581 new publications, 231 numbers of six periodicals and 490 reprints, in total editions of 30,694,306 copies, of which 13,183,607 were Farmers' Bulletins. The *Year Book* for 1925 was the last of a series begun in 1921, and contained articles on the production, nutritive value, diseases and pests, and market-

ing of fruits and vegetables, history of the fruit and vegetable industry and its relation to other farm enterprises, and horticultural manufactures. An appendix of nearly 800 pages contained statistics of crops, live stock, forestry, imports and exports, farm property and income, cost of production, farm prices, farm population, etc.

**RADIO SERVICE.** To give agricultural information to the rural people who own nearly 1,000,000 radio sets a new section was established in the Office of Information, known as the radio service. Ninety broadcasting stations, representing all parts of the country, loaned their facilities to the Department for an average of half an hour daily. A United States Radio Farm School, with half a million enrollment, was conducted from 25 stations, on the basis of printed lessons distributed to the students. "Noonday flashes" were sent to farmers from 50 stations and a "Housekeepers' Chat" was broadcast to farm women from 40 counties.

The Departmental library contained about 200,000 books, pamphlets and bound periodicals, of which about 15,000 were added during 1926.

**AITCHISON**, At-shi-son, JOHN YOUNG, American clergyman, died at Chicago, Ill., March 15. He was born at Cascade, Dubuque County, Ia., May 27, 1868, and after studying at Central College, Pella, Ia., and at Des Moines College, Iowa, graduating from the latter in 1893, he attended the Divinity School of the University of Chicago, 1893-96. He was ordained to the Baptist ministry in 1896, though he had previously served as pastor of the First Church, Wasco, Ill., 1894-95, and the First Church of Maywood, Ill., 1895-96. In 1896 he was called to the Garfield Park Church at Milwaukee, Wis., serving two years until he assumed the pastorate of the First Church at Shenandoah, Ia., where he served from 1898-1902. In the latter year he became pastor of the First Church at Galesburg, Ill., acting in that capacity until 1909, when he became secretary of the American Baptist Home Mission Society at Chicago. Three years later he was made joint district secretary of the American Baptist Home Mission Society and American Baptist Foreign Mission Society, Chicago, and in 1916 home secretary of the American Baptist Foreign Mission Society.

From Aug. 1, 1919, Dr. Aitchison served as director of the General Board of Promotion established by the Northern Baptist Convention held at Denver in the preceding May. This organization had as its objective the raising of \$100,000,000 to advance the work in the ensuing five years, known as the New World Movement. It was the greatest task ever undertaken by this denomination, but unfortunately it was put forward at a time unfavorable for securing large financial support. Nevertheless, Dr. Aitchison labored loyally and earnestly, and, at the end of the five year period, when the Board of Promotion was succeeded by the Board of Missionary Cooperation, he was unable to permit his name to be considered for the position of executive secretary of the new organization. In 1924, however, Dr. Aitchison was selected by the trustees of the University of Chicago, who were anxious to increase the capital resources of that institution, as assistant to the president, Dr. E. D.

Burton. His special duty in this position was to interest those able to use their wealth for the betterment of humanity through the various opportunities presented by the university. During the eighteen months of his work with the university the endowment fund was increased by nearly \$700,000. Dr. Aitchison was an able administrator, and was considered at the time of his death one of the great leaders in the American Baptist Denomination.

**AJAKITE.** See CHEMISTRY under *Mineralogical Chemistry*.

**AKELEY, CARL ETHAN.** American hunter, naturalist, and artist, died at Kabale, Uganda, Africa, November 17, while on a tour of East Africa to obtain specimens for the American Museum of Natural History. He was born in Orleans County, N. Y., May 19, 1864, and was educated at the State Normal School of Brockport, N. Y. In 1895 he became connected with the Field Museum of Chicago and was with that institution until 1909, when he joined the staff of the American Museum of Natural History of New York. In addition to his work as a naturalist he was an engineer and inventor serving as consulting engineer in the division of investigation, research and development of the Engineering Department of the United States Army. He was also a special assistant in the concrete department of the Emergency Fleet Corporation, and the cement gun which he invented became widely used. He also invented a motion picture camera which could be used extensively in field work.

Akeley was a man of versatile attainments and, in addition to being a naturalist and big game hunter, who had made four trips to Africa for study and collection of big game, he was a sculptor and taxidermist of high rank. These gifts were united in the preparation of various wild animals for display in the American Museum of Natural History, and coupled with it was the devising of lifelike surroundings for the specimens, so that preconceived methods of museum display were revolutionized, and the various groups were presented in their life-surroundings in a manner previously not deemed possible. He was a member of the National Sculpture Society, the Architectural League of New York, the National Institute of Social Sciences, the Franklin Institute, and many other societies as well as the Explorers, the Ends of the Earth, Adventurers, and other clubs. The work on which Akeley was engaged, namely the creation of an African Hall in the American Museum of Natural History, was provided for by George Eastman and Daniel E. Pomeroy. It was begun in 1914, and it was expected that the acquisition of material would require some 18 years, but the work was interrupted by the War. He wrote: *In Brightest Africa* (1923).

**ALABAMA.** POPULATION. According to the Fourteenth Census, the population of the State, on Jan. <sup>1</sup>, 1920, was 2,348,174. The estimated population on July 1, 1926, was 2,526,000. The capital is Montgomery.

**AGRICULTURE.** The following table gives the acreage, production and value of the principal crops in 1925 and 1926:

Crop	Year	Acreage	Prod. bu.	Value
Corn	1926	2,825,000	45,765,000	\$34,781,000
	1925	2,797,000	37,760,000	37,760,000
Cotton	1926	3,718,000	1,490,000 *	79,715,000
	1925	3,504,000	1,857,000 *	128,210,000

Crop	Year	Acreage	Prod. bu.	Value
Peanuts	1926	140,000	79,800,000 *	8,591,000
	1925	180,000	100,800,000 *	3,226,000
Sweet potatoes	1926	65,000	6,500,000	5,525,000
	1925	65,000	4,550,000	5,688,000
Hay	1926	603,000	572,000 *	10,224,000
	1925	578,000	389,000 *	7,738,000
Potatoes	1926	29,000	2,080,000	4,060,000
	1925	25,000	1,425,000	3,135,000
Oats	1926	138,000	3,086,000	2,064,000
	1925	131,000	2,227,000	1,737,000
Peaches	1926		1,159,000	1,275,000
	1925		1,312,000	2,099,000

\* bales, \* pounds, \* tons.

**MINERAL PRODUCTION.** Chief of the State's mineral products were coal and iron ore. Coal production in 1925 was 20,004,395 tons; in 1924, 19,130,184 tons. Coal mined in 1925 was valued at \$42,442,000; in 1924, at \$44,756,000. Of iron ore mined in the State the quantity was 6,891,081 long tons in 1925 and 6,557,596 long tons in 1924; the value, \$14,134,677 in 1925, and \$13,927,551 in 1924. Blast furnaces in the State produced in 1925, 2,910,370 long tons of pig iron; in 1924, 2,667,361 long tons. Its value in 1925 was \$57,777,275, and in 1924, \$55,791,228. Coke production for 1924, the latest year available, was 4,541,058 short tons; for 1923, 4,654,075 short tons. The product in 1924 was valued at \$17,404,066; that in 1923 at \$19,817,394. Other mineral products are cement (production in 1925, 6,258,000 barrels; in 1924, 5,552,550 barrels), graphite, sand, gravel and stone. The total value of mineral products in 1924 was \$77,315,758; in 1923, \$82,496,430, eliminating duplications.

**FINANCE.** As summarized by the United States Department of Commerce, the payments for maintenance and operation of the general departments of the State government for the fiscal year ending Sept. 30, 1925, totaled \$13,537,426, and were at the rate of \$5.50 per capita. The rate per capita was in 1924 \$5.71; in 1917, \$3.05. The 1925 total included \$3,983,047 in apportionments to minor civil divisions for education. Interest on debt amounted to \$1,110,935. Outlays for permanent improvements totaled \$11,427,578. Total payments for general department expenses, public service enterprises, interest and permanent improvements were \$26,086,439. On highways were spent \$9,135,019 for construction and \$596,341 for maintenance; in all, \$9,731,360.

Revenue receipts for 1925 totaled \$20,217,399. They were at the rate of \$8.21 per capita. Revenue receipts exceeded by \$5,558,538 the payments exclusive of those for permanent improvements, and were \$5,869,040 less than the payments including these. This excess of payments over revenue was met by the proceeds of debt obligations.

Property and special taxes formed 38.5 per cent of the total revenue for 1925, and were at the rate of \$3.16 per capita. The percentage was in 1924, 37.6, and in 1917, 55.3. The per capita taxation was in 1924, \$2.99, and in 1917, \$1.94. Earnings of general departments and compensation for services rendered by State officials supplied 20.4 per cent of the total revenue for 1925. Business and non-business licenses supplied 21.3 per cent.

The net indebtedness of the State on Sept. 30, 1925, was \$28,280,049, or \$11.49 per capita, as against \$8.27 per capita in 1924 and \$5.80 in

1917. The assessed valuation of property in 1925 was \$1,050,421,680. The State taxes levied amounted to \$6,827,741, or \$2.77 per capita.

**TRANSPORTATION.** The total mileage of railway line at the end of 1925 was 5,254.45. No new construction was reported in 1926.

**EDUCATION.** The State Department of Education and the Alabama Educational Association were active during the year presenting the educational needs of the State to the public. The main effort was to obtain material increase of appropriations from the Legislature at its 1927 session. The governor-elect was looked upon as definitely committed to greater school revenue. Preparations were made to seek the establishment of an equalization fund and of other improvements in the educational organization. The Educational Association completed a consecutive two-year campaign in favor of its objectives.

**CHARITIES AND CORRECTIONS.** The State Board of Administration, formerly the Board of Convict Supervisors, directs the hospitals, insane asylums and child welfare institutions of the State and supervises the employment of State prisoners under the convict leasing system. It issues a quadrennial report coinciding with quadrennial sessions of the State legislature.

**POLITICAL AND OTHER EVENTS.** At the November election Bibb Graves, the Democratic candidate, was elected Governor, to succeed Governor William W. Brandon. As United States Senator, Hugo L. Black, Democrat, was elected to the Seventieth Congress, as successor to Senator Oscar W. Underwood, who had announced in 1925 that he would not seek reelection. All ten members of the U. S. House of Representatives forming the State's delegation in the House of the 69th Congress were reelected, all being likewise Democrats. Other officers elected in 1926, to take office Jan. 17, 1927, were: Lieutenant-Governor, William C. Davis; Secretary of State, John Brandon; Treasurer, W. B. Allgood; Auditor, S. H. Blan; State Superintendent of Education, R. E. Tidwell; Attorney-General, Charlie C. McCall; Commissioner of Agriculture and Industries, S. M. Dunwoody.

A movement for the reform of the State's prison system was started during the year and led to drawing of bills to put an end to the practice of leasing convicts to work for private persons and companies. The body of a prisoner who had been hired out by the State as a worker and who had died at the Flat Top Mine Camp was examined by a coroner's jury in February and found to show evidence of beating. By the beginning of May the deaths of five convicts were under investigation. Two wardens at convict labor camps were indicted for murder of convicts. Bibb Graves, contestant for the governorship in the Democratic primary, ran on a platform calling for the end of the convict leasing system and for employing convicts instead on public road building. He won in the primary of August 10. Accordingly in December the Lieutenant-Governor elect, W. C. Davis, prepared bills to be submitted in the State legislature early in 1927. These provided for the termination of leasing, for the establishment of State owned material plants and for convict road work.

**OFFICERS.** Governor, William W. Brandon; Lieutenant-Governor, Charles S. McDowell; Secretary of State, Sidney H. Blan; Treasurer, George W. Ellis; Auditor, William B. Allgood;

State Superintendent of Education, John W. Abercrombie; Attorney-General, Harwell G. Davis; Commissioner of Agriculture and Industries, J. M. Moore.

**JUDICIARY.** Supreme Court: Chief Justice, John C. Anderson; Associate Justices, William H. Thomas, A. D. Sayre, Ormond Somerville, Lucien Gardner, B. M. Miller, and Virgil Boul-din.

**ALABAMA, UNIVERSITY OF.** A State institution for higher learning at University, Ala.; founded in 1831. For the fall term of 1926 there were 2280 students enrolled, as follows: arts and science, 1190; engineering, 270; law, 132; medicine, 100; graduate, 26; education, 61; commerce, 501. 1959 attended the summer session. The faculty numbered 100, three of whom were newly appointed. The productive funds of the university amounted to \$1,659,693.38, and the income for the year was \$591,207.31. The library contained 75,000 volumes, 20,000 of which were government documents. A new Chemistry Building was added during the year, at a cost of \$200,000. President, George H. Denny, Ph.D., LL.D.

**ALASKA.** The Territory in 1926 was gradually recovering from the depression following the World War. Industrial and economic conditions improved during the year, and it was evident that Alaska was in the way of self support. Territorial finances were in excellent condition, as well as the banking institutions,—with no deficits or liquidations. The balance of trade steadily favors the Territory, the increase for the year amounting to \$1,878,497,—from \$27,420,893 in 1925, to \$29,024,224 in 1926. While exports decreased to the value of \$1,920,000, there was an increase in fur shipments exceeding \$400,000. Seal, reindeer and fur-bearing animals are increasing in numbers. Most encouraging was the attention given to Alaskan matters by Congress. It enacted 14 public bills and 1 resolution, which corrected many of the legal disadvantages under which the Territory had suffered for more than fifty years. Alaska was also benefiting by the home-rule policy, under which it had a governor, who, through long residence in the Territory, was familiar with its resources and its needs for development.

**COMMERCE.** The total exports and imports rose during the year to \$92,844,000, an increase of \$1,878,000. The healthiness of the trade was shown by the balance of \$29,300,000 in favor of the Territory. Fish and copper constituted 78.8 per cent of the exports. The entry of vessels increased to 2948. The total of industrial investments is unknown, but must approximate 100 millions, as those of the fisheries amounted to 67 millions in 1925.

**RAILWAYS.** The only changes in transportation by rail pertain to the Federal road, the Alaska Railroad. The railway system was necessarily supplemented by river service on the Yukon, as the commercial fleets were discontinued when the railroad opened. The upper Yukon is obliged to depend on Canadian steamers, but the Alaska Railroad provides transportation for the Nome region by steamers from Nenana on the Tanana, to Holy Cross, on the lower Yukon, where connection is made with the launch service of the Northern Commercial Co., thence to St. Michael and Nome.

The maintenance and operation costs of the railroad had been economically reduced, but very

little had been done to complete the construction of the railway, for which \$11,000,000 was necessary. The local needs were met by two mixed trains each week. During the summer an additional train runs between Seward and Anchorage, with a weekly motor-train between Anchorage and Fairbanks. The branches have two trains a week throughout the year. Special trains for hunters and tourists are run whenever needed. Revenue from passengers increased to \$57,567, and the commercial tonnage rose to 65,036 tons. The total transportation and incidental revenues increased 23.2 per cent, to \$1,063,553. The entire rail expenses, including replacement, was \$1,981,833, a decrease of 14.3 per cent. River-boat expense was \$106,225. Total deficit, including charges to capital, was \$1,690,751, a decrease of 18.3 per cent. Mining and other industries were developing along the railway, which would lead to increased demands for transportation. Interruptions to traffic were few, and there were no casualties in train operations.

**ROADS AND TRAILS.** Beneficial as is the rail transportation, it is less important than are roads and trails, in the development of Alaskan resources. The funds for road purposes are Congressional appropriations, the Alaska Fund, National Park funds, forest funds and territorial appropriations. Apart from the forests, the work is generally under the Federal Road Commission. In 1926 the work was largely directed to the rehabilitation of roads and trails in remote regions, begun in 1920,—a system that extends to all inhabited localities. All classes of work covered 6496 miles, as follows: Wagon roads, 1234 miles; tramways, 9100 miles; sled roads, 949 miles; permanent trails, 3844 miles; flagged trails, 368 miles. The Richardson Highway was of great utility. Between Fairbanks and Circle, 100 miles are passable for wagons, and the whole road for double bob-sleds in winter. These roads since 1911 had reduced freighting costs over two million dollars.

**COMMERCIAL AVIATION.** Considering this method of transportation to be essential, the Legislature appropriated funds for the construction of 25 aviation fields, varying in size from 300 × 800 feet, to 600 × 1400 feet. Two companies were operating from Fairbanks as a centre.

**FISHERIES.** The fish industry has for years been the most important in the Territory,—investments, personnel and products. Its conservation, a problem of great Federal importance, has engaged the attention of Congress, of the Department of Commerce, as well as of the entire Pacific coast region. After the International Pacific Salmon Investigation Federation had coöperated in studying conditions, Congress by the Act of June 6, 1924, amended by the Act of June 18, 1926, authorized the Secretary of Commerce to issue regulations for conservation purposes, by limiting or prohibiting Alaskan fishing. In 1925 modified regulations were issued, closing areas where over-fishing had occurred; extending closed periods; and limiting fishing apparatus. As investigations dictated, amendments were made, the last to go into effect in 1927. The offshore fishery—halibut—was the subject of a treaty with Canada, under which winter fishing was prohibited.

The maximum product was in 1919, after which there was a sharp decline in the catch. In 1924 the value was \$40,289,273; in 1925, \$40,-

038,745, a decrease of \$250,528. The exact figures for 1926 are unavailable, but the value will exceed \$50,000,000. The investments increased from \$62,400,000 in 1924 to \$67,100,000 in 1925, and the personnel rose to 27,685, of whom 15,996 were whites and 4607 natives.

**SALMON.** The fishing of the salmon continues to be the leading industry of the Territory, as evidenced by investments, personnel and products. The active investments reached \$55,543,544 in 1925, an increase of 1.5 per cent over the previous year. The personnel numbered 27,685, of whom 58 per cent were whites and 17 per cent natives. In 1924 the output of canned salmon,—which constitutes more than 90 per cent—amounted to 5,294,915 cases, valued at \$33,007,000. There was a large decrease in the catch of 1925, when the 4,459,937 cases had a value of \$31,989,531. The output and value were: Coho, 161,010 cases, \$1,565,750; chum, 1,078,680, \$4,787,030; humpback, 2,116,593, \$11,137,102; king, 49,978, \$595,041; red, 1,059,676, \$31,989,531.

The fears that the restrictive regulations would be followed by a further decrease were unfounded. At the end of August the catch of 1926 was reported at 6,307,000 cases. When the final figures become available, it is probable that they will approximate the maximum product of 1918, 6,805,835 cases, and that the value of the salmon products will exceed \$50,000,000. The great increases of the year were pinks and reds, from the waters of central and western Alaska. Salmon products, other than canned, amounted in 1925 to \$1,751,369, the principal being mild cured salmon, \$1,085,466.

**HALIBUT.** The product of this fishery in 1925 was 10,971,651 pounds, value \$884,383. This was a reduction of 4,065,065 from the catch of the previous year, due to the closed season, under treaty, from November 16 to the following February 15. The thorough investigation of the life history of the halibut, as required by the treaty of Oct. 21, 1924, between Canada and the United States, was in progress. Data so far covered the progressive depletion of near-by banks, which has caused heavy declines since 1916 in the catch. Reports as to American caught halibut, landed in British Columbia, were not available.

**HERRING.** The most marked change in the fisheries of 1925, was the great expansion of the herring industry. The increases from 1924 were as follows: Plants from 32 to 54; investments from \$3,850,000 to \$6,100,000; personnel from 1407 to 1839, products from value of \$2,458,000 to \$3,852,000. The increases were due chiefly to the larger output of fertilizer and oil in southeastern Alaska, and the development of the herring fishery around Afognak Island. The chief products were Scotch cured herring, \$2,270,577; oil, \$999,045. Criticism was made of food waste in producing oil.

**MINOR FISHERIES.** There were caught 512 whales, yielding an increase from \$391,781 in 1924 to \$624,959 in 1925. The cod fishery increased in products from \$100,777 to \$128,803 in 1925. The clam industry decreased in value from \$629,412 to \$492,051. The 1925 products from shrimps, \$207,315; crabs, \$53,357; trout, \$6137; other fish, \$48,301.

**FUR-SEALS.** The rookeries were occupied by an increased number of seals, and the usual care in their management was exercised. The Asiatic rookeries are marked by decreases, the Russian

herd at the Commander Islands being estimated at 10,000, and the Japanese at Robben Island, 29,000. The United States share of Japanese seals, under the convention of 1911, numbered only 94 skins in 1924, and 87 in 1925. The American herd at the Pribilof Islands steadily increased. The Census reported 607,158 seals in 1924; 723,050 in 1925; and 761,281 in 1926. Pelts were taken only from surplus males, mostly three-year olds. In 1925 there were taken 23,879 fur-seal skins. There were sold in 1925, 23,879 pelts for \$787,990, and in October, 1926, a lot of 8256 for \$313,288. The fox industry of the Pribilof group was thriving. The output in the season 1924-25 numbered 341 blue and 28 white pelts; in the season 1925-26, 580 blue and 20 white pelts. At the sale in October 465 blue pelts brought \$24,740.

**GAME AND FUR CONDITIONS.** As a result of the researches of the Alaska Game Commission, under the law of Aug. 10, 1925, the Secretary of Agriculture issued revised regulations, which became effective Aug. 26, 1926. The revenues from licenses and fines are divided between the Federal Treasury and the Alaskan school funds; in the year it amounted to \$18,752. Systematic stocking of suitable animals was initiated on islands where game was scarce. The value of the pelts of land fur-bearing animals, shipped out in 1925, approximated \$2,500,000.

**MINERALS.** The production of minerals exceeds \$570,000,000 in value from 1880 to the end of 1926. In general the output, despite adverse conditions, was increasing irregularly, the values being \$17,457,000 in 1924; \$18,221,000 in 1925; and probably \$17,500,000 in 1926. The decrease in copper, silver and lead was due to lower value per unit.

**GOLD.** To the end of 1926 the value of gold mined was \$372,000,000. The output in 1926 was \$6,020,000 against \$6,360,000 in 1925. The increase in 1926 was due principally to increased work by dredges, especially in the districts of Fairbanks, Seward Peninsula (Nome), and the upper Yukon. Recent installations in the Hot Springs and Fairbanks districts ensured further increases. In the order named, the largest placer outputs were those of the Yukon Basin, the Seward Peninsula, the Cook Inlet-Susitna, and the Kuskokwim. The quartz outputs were of the Alaska Juneau, Chicagof Island, and Willow Creek. The Alaska Juneau handles over 10,000 tons of ore daily, and its output in 1925 had a value of \$2,184,000, of which \$2,030,000 was gold.

**COPPER and SILVER.** As about 80 per cent of silver comes from copper ores, the two metals are considered together. The output for both in 1926 was \$9,920,000 against \$10,844,000 in 1925. The decrease was due to a fall of 7 cents per ounce in the value of silver, and about 0.80 cent per pound of copper. The copper value to the end of 1926 was \$188,100,000. Most of the copper came from the mines of Kennecott, Mother Lode and Beatson. About 74,000,000 lbs. were mined, as usual.

**COAL.** The production was about 83,000 tons in 1926, valued at \$400,000. The only considerable market for the coal, was for fuel on the Alaska Railroad. The inability of the operators to control the market was shown by the importation of 32,087 tons during the year.

**MINOR MINERALS.** The output of lead, petroleum, marble, platinum, tin, etc., decreased, due

largely to low prices, from \$612,000 in 1925, to \$550,000 in 1926.

**PETROLEUM.** The only Alaskan output was from the 16 private wells of the Chilkat Oil Co., which amounted to 7963 barrels. This was refined and marketed locally, at Cordova. The inadequacy of this output was shown by the importation during the year of petroleum and petroleum products to the value of \$2,216,000. The exploratory work of the Standard Oil Co., on Pearl Creek, Alaska Peninsula, has been abandoned, after three years, during which a test well was drilled to the depth of 5034 feet. The final report recited that this well "proved wholly unproductive of petroleum . . . The well constituted a full test of the formation." The Associated Oil Co. drilled nearby a well to 3000 feet without success. Faith in the oil deposits of the Territory were evidenced by 57 applications for oil permits, filed during the year. They cover 138,445 acres, principally in the fields of Anchorage, Cold Bay and Yakataga. Exploratory work continued in the Chikalon field, and on Pearl Creek, Yakataga, with fair prospects of success. Examination of Naval Petroleum Reserve, No. 4, continued without any promising results.

**FORESTRY.** The public utility of the national forests have materially increased during the year. Under recent regulations the occupancy of suitable landsites had been greatly facilitated. For such utilitarian purposes there were at the end of 1926 220 homesteads, 98 industrial establishments, and, on small islands, 210 fox-farms. Forest administration was facilitated by 169 miles of road, and 259 miles of trails. Exportation of timber was made legal. The estimated total stand of timber is 85 billion feet, board measure. In the fiscal year 1925, the forest receipts were \$28,337, to the end of 1926 they totaled \$1,250,000; of these receipts 25 per cent is expended for local schools and public roads.

The most important actions of the year were the steps taken to utilize the Sitka spruce and western hemlock of the Tongass Forest, southeastern Alaska. Through excellent aerial surveys, the physical conditions of this forest were charted. Negotiations were initiated for the commercial use of two water-power sites, and of adjacent timber for the manufacture of paper-pulp. In this connection proposals were invited for the sale of suitable pulp timber, amounting to five billion board feet.

**REINDEER.** The deer in 1926 numbered over 350,000, and formed over 100 herds, nearly all on the coasts of Bering Sea and the Arctic Ocean. Two thirds were owned by Eskimo. The remaining third was being gradually commercialized; of these the meat was being exported, the amount in 1925 being near 340 tons. As the industry was facing disaster by deterioration of stock, overgrazing of grounds, improper herding, and local diseases, the Biological Survey, under Nelson, continued its researches for the improvement of the industry. Following the biology of the animal, its diseases and parasites, it was pursuing other factors. These cover development of interior ranges, forage and range management, carrying capacity of lichen and non-lichen ranges, feed methods, breed improvement, and disease control.

**FUR INDUSTRIES.** The Alaska Game Commission and the United States Biological Survey co-operated in the development and conservation of the game resources. By law under the Secretary

of Agriculture, regulations were issued May 18, 1926. Revenue from licenses was \$18,764, divided equally between the Federal Treasury and the Alaskan school fund. The value of the pelts of land fur-bearing animals shipped out in 1925 was over \$2500. The number and value of the principal pelts follow: White fox, 16,658, \$583,089; mink, 59,504, \$416,528; muskrat, 395,142, \$335,870; red fox, 19,489, \$331,313; blue fox (exclusive of the Pribilof, discussed above under *Fur-Seals*) 5493, \$273,710; lynx, 7920, \$134,640. In the fur industry, there has been invested over \$6,000,000 in the establishment and operation of over 400 fox farms, mostly on small islands.

**TERRITORIAL EDUCATION.** Schools are maintained under territorial supervision for white children and those of mixed blood leading a civilized life. There are 3 classes of schools. Those in the 17 incorporated towns end with a high school course. In these were 133 teachers and 2988 pupils, with an average attendance of 2466; the expenditures were \$315,112. In outlying districts there were 59 schools, with 74 teachers and 1309 pupils, averaging 1054 in attendance; the cost was \$164,248. Four special, or coöperative, schools had 55 pupils. For the purpose of training foreigners for American citizenship, there were night schools in 11 communities, at which were taught 62 women and 246 men, of 27 nationalities.

The only institution of higher learning is the Agricultural College and School of Mines. The courses cover Agriculture, Chemistry, Engineering, Home Economics and Mining. It coöperates with the Federal Bureau of Mines, for which it makes assays, analyses and tests. The plant cost \$273,000. The faculty numbers 14, and there are enrolled 94 men and 70 women. Tuition is free, while room and board are provided for \$55 per month.

**AGRICULTURE.** In 1926 barley, oats and wheat, except the very latest species, had matured fully, and the vegetables had a large yield. Dairy experiments were succeeding by cross breeding. Three farmer associations were organized, and the one at Fairbanks had built a flour mill, with a daily capacity of 25 barrels; it was expected that 35 or more tons of flour would be produced. Sheep raising on the Aleutian islands was progressing favorably; many sheep were added in the year.

**NATIVES.** Except those associated with industries, and the Eskimo herd owners, the conditions of the natives were, if possible, worse than ever. Congress fails to appropriate sufficient funds either for education or medical attendance. The efficient territorial officials, and the devoted agents of the Federal Bureau of Education, do their utmost with limited means. Less than half the children were being educated, and fewer yet being cared for medically. Greely in 1908 found that more than half the natives were suffering from contagious diseases. Governor Parks reports, "tuberculosis and other deadly diseases are ravaging the natives . . . practically without check." About 13,000 natives have no Federal care.

Some 4000 individuals, white and native, were dependent for 1000 miles along the Yukon, on one small hospital of a dozen beds. Conditions in the summer of 1926 were improved, by a medical launch to visit settlements and make a sanitary survey.

**SCHOOLS.** In 1926 the 126 schools for natives were open, on the average, 126 days, with an enrollment of 3582 pupils, and an attendance of 76.3 per cent. In addition to their regular duties,—wherein are taught home economics, and industrial training,—teachers supervise homes, administer medical assistance, and are sanitary engineers. They made 12,033 home visits, and treated medically 8311 patients. Besides an orphanage with 143 children, there were 5 hospitals, with medical staffs which cared for 2836 patients. As to condition, a medical examination in the extreme north of 500 children disclosed 736 physical defects, but only one child was found to be feeble-minded.

**SPECIAL FEDERAL ACTIVITIES.** The U. S. Geological Survey continued its indispensable surveys and researches, geologic and topographic, which by 1926 covered more than 40 per cent of the Territory. Besides its magnetic work, the U. S. Coast and Geodetic Survey has assisted safe navigation by its work on tides, currents, submerged ledges and shoals. The U. S. Light House Board installed 27 new aids to navigation. The U. S. Army Chief of Engineers improved harbors at Nome and elsewhere. The U. S. Biological Survey formulated and enforced regulations for game preservation, studied the reindeer problem, and coöperated with Canada on subjects of mutual interest. The Public Health Service did much sanitary and relief work. The wireless and cable service of the Signal Corps of the Army had been so efficiently performed as to receive the highest commendation of Governor Parks.

**ALBANIA,** *äl-bā'nī-ä.* A geographical district in the Balkans consisting of the former Turkish provinces of Scutari and Yanina and parts of the Turkish vilayets of Monastir and Kossova. The boundaries have been only partially fixed as a result of the work of an international commission appointed in 1922. The probable area of the country is estimated at about 17,347 square miles; the population is estimated at 831,877, of whom 584,675 were Mohammedan, 158,215 Greek Catholic, and 88,987 Roman Catholic. The country is divided into eight provinces named after the chief towns. The latter, with their estimated populations, are as follows: Tirana, 12,000; Scutari, 32,000; Korytza, 24,000; Elbasan, 13,000; Argyro Castro, 12,000; Berat, 8500; Valona, 6500; and Durazzo, 5000. The principal race groups are the Ghegs in the north and the Tosks in the south. No later statistics on education are available than those given in the last YEAR BOOK which mentioned about 548 primary schools with 854 teachers and 24,000 pupils. There is an American technical school at Tirana. Agriculture is very primitive, and large tracts of land remain uncultivated. The chief products are: Tobacco, wool, olive oil, corn, and cattle. The mineral wealth is reputed to be considerable although almost entirely undeveloped. There are also valuable forests. A coarse native cloth is manufactured from wool, but for the most part such manufactures as exist in the country pertain to the working up of agricultural products. No later figures for commerce and finance are available than those give in the preceding YEAR BOOK.

Albania was declared an independent country by the general in charge of the Italian forces, June 3, 1917, and a provisional government was set up at Durazzo. Under the constitution adopted in 1925 there is a parliament with 99 members and a senate of 18 members, 12 elected

and 6 nominated. The president of the republic at the beginning of 1926 was Ahmed Zogu (Sept. 1920, 1925).

**HISTORY.** As noted in the preceding YEAR BOOK, the situation of Ahmed Zogu was anything but secure as the year drew to a close because of the machinations of Fan Noli and his followers on the border. Throughout the year the situation remained comparatively quiet for Albania. In the early months by free use of exile and other drastic measures, Ahmed seemed to have completely crushed the remnant of Fan Noli's followers that remained in the country. The tribal chieftains seemed to be sufficiently cowed to show no emotion when Ahmed let it be known in the early months of the year that he intended to proclaim himself the king of Albania whenever he thought conditions were ripe. Although this particular event never occurred, Ahmed devoted his time to transforming Albania into a modern state. His task was almost hopeless because he was a believer that the reforms must come from him and not from the people. The enlightened despots of the eighteenth century had tried his method but had failed miserably.

Ahmed's life was very secluded because of the lurking fear of assassins and the continual striving and plotting of Fan Noli and his followers to unseat him. In September and October the press reported a revolt of more than ordinary proportions sponsored by Albanians in Italy. The report stated that government troops were compelled to flee to Jugo-Slavia where they were disarmed and that Ahmed Bey himself was forced to flee to Durazzo. These reports had little foundation on fact.

On November 27, a treaty was signed between Italy and Albania, which, while in accordance with Mussolini's policy of Balkan-Italian unanimity, caused a considerable furor throughout Europe and particularly in Jugo-Slavia, where the cabinet resigned because of it. The treaty, which was to run for five years and then could be renewed for four more, was a "compact of friendship and security." The feature of this treaty which distinguished it from treaties between Italy on one hand and Greece, Jugo-Slavia, and Rumania, on the other, was the fact that Italy undertook to guarantee Albanian territorial integrity. In other words it was an acceptance on the part of Albania of the working agreement reached by the Council of Ambassadors in their declaration of Nov. 9, 1921, but which was refused by Albania at that time. The treaty provided that each state was "not to conclude with other powers political or military agreements prejudicial to their mutual interests." Premier Uzonovitch of Jugo-Slavia resigned his post because of the publishing of the terms of this treaty. His action followed a similar move on the part of Foreign Minister Ninchitch, who declared that the signing of this treaty was a danger to peace in the Balkans. The press of Jugo-Slavia declared in no uncertain tones that the treaty in a secret clause guaranteed military aid to Ahmed Bey in case his position was attacked.

The Italian Foreign Office denied that there were any secret military provisions in the treaty and expressed diplomatic surprise that consternation should have been caused in Jugo-Slavia when the intent in the treaty was merely to maintain the status quo in Albania. Hopes that Albania would not ratify the treaty proved groundless when such action was taken on De-

cember 10. The press of Greece took a calmer attitude than that of Jugo-Slavia and stated that inasmuch as the treaty had to be filed with the League of Nations there was sufficient guarantee that the sovereignty of Albania was not threatened by the agreement with Italy.

On July 31, representatives of Albania, Great Britain, France, Italy, Japan, Greece, and Jugo-Slavia agreed to two protocols concerning the Albanian-Greek frontiers and the Albanian-Serb frontiers. These protocols are the outgrowth of the work of the commission appointed in 1921 to settle the boundary questions of Albania after it had been admitted to the League of Nations.

**ALBERS,** al'bĕrs, HENRI. A distinguished French dramatic tenor, died in Paris, September 12. Born in Amsterdam, in 1866, he received his musical education at the Conservatory of his native city, where he also made his debut, in 1889, as Mephistopheles in *Faust*. Massenet heard him in Brussels, and persuaded him to come to Paris, where he settled definitely and became a French citizen. In the early nineties he was heard in New Orleans, and during the season of 1898-99 he was a member of the Metropolitan Opera Company. He had the distinction of creating the rôles of Wotan (*Walküre*) Hagen (*Götterdämmerung*) and Hans Sachs (*Meistersinger*) in the French premières of those works.

**ALBERTA,** al-bŭr'tā. A northwestern province of Canada, formerly consisting of a large part of the Northwest Territories; bounded on the east by Saskatchewan, on the west by British Columbia, and on the south by the United States. Area, 255,285 square miles; population (1921), 588,454, as compared with 496,525 in 1916. The estimated population in 1925 was 651,700. The rural population in 1921 numbered 365,550, and the Indian, 8745. Chief towns with their populations according to the census of 1921: Calgary, 63,305; Edmonton, 58,821; Lethbridge, 11,097; and Medicine Hat, 9624. The movement of population in 1924 was: 14,244; deaths, 4661; marriages, 4077.

Although agriculture is the chief occupation there are valuable deposits of coal, natural gas, and petroleum. Besides the raising of grain, livestock and dairying are the chief industries. The acreage and crop of the principal grains in 1925 were as follows: Wheat, 5,704,547 acres, 114,043,000 bushels; oats, 2,397,350 acres, 88,230,000 bushels; barley, 552,727 acres, 14,757,000 bushels; rye, 134,322 acres, 2,421,000 bushels; flax, 5000 acres, 46,000 bushels; mixed grains, 15,026 acres, 410,000 bushels. It has been reported that Alberta contains 17 per cent of the coal reserve of the world. In 1924 the output was 5,203,713 tons. In the same year the value of the natural gas output was \$1,850,000. The total mineral production in 1924 was valued at \$22,749,662.

Executive power is nominally vested in a lieutenant-governor appointed by the Federal Government, but it is actually vested in an executive council or cabinet. Legislative power is in the assembly, which is elected by direct vote including woman's suffrage. Lieutenant-governor at the beginning of 1926, Dr. W. Egbert; prime minister, John Brownlee. At that time there were 59 members in the legislature, including 40 United Farmers; 12 Liberals; 3 Laborites; 3 Independents; and 1 Conservative. See CANADA.

**ALFALFA.** The United States Department of Agriculture estimated the alfalfa area of the

country in 1926 at 11,057,000 acres and the yield of hay at 27,496,000 tons, as compared with 10,852,000 acres and 28,439,000 tons in 1925. The average yield for the two years was 2.48 tons and 2.62 tons per acre respectively. As in the preceding year California ranked first in yield with 3,924,000 tons produced on 981,000 acres, or at the rate of four tons per acre. Nebraska still leading in area with 1,258,000 acres, the only State growing over a million acres, ranked second in total production with 2,566,000 tons or a little over two tons per acre. As compared with 1924 the area in Nebraska was reduced by 100,000 acres and the production by 693,000 tons. The 1926 yields of other important surplus-producing States were estimated as follows: Colorado 2,285,000 tons, Idaho 2,157,000 tons, Kansas 1,786,000 tons, Utah 1,609,000 tons, Montana 1,190,000 tons and Michigan 1,078,000 tons. Alfalfa production in Michigan during the past several years has shown much progress. The higher freight rates have increased the cost of alfalfa hay to the eastern farmer and tend to increase alfalfa production in eastern sections.

Alfalfa seed production in 1926 was reported by the Department of Agriculture as amounting to 56,500,000 pounds on a country run basis or not re-cleaned after threshing. The total production for the year was about 10 per cent below that of 1925, due mainly to a marked reduction in the seed yield of Utah, which, in 1925, produced nearly one-half of the total crop of the country. Prices paid to growers during the fall of 1926, averaging lower than the year before, ranged from \$12 to \$15 per 100 pounds on a clean seed basis for common alfalfa seed and from \$25 to \$35 for the hardier Grimm alfalfa. Approximately 40 per cent of the seed crop was reported as having left growers' hands by October 20 and 75 per cent by November 16. Imports of alfalfa seed into the United States for the year ended June 30, 1926, the smallest since 1921, amounted to 4,548,300 pounds as compared with 4,782,000 pounds in 1925, 12,818,400 pounds in 1924, 8,784,000 pounds in 1923 and 5,570,000 pounds, the average for the past fifteen years. Of the quantity imported in 1926, 4,218,000 pounds came from Canada, 221,700 pounds from Argentina and 107,300 pounds from Latvia. Of the 1,332,992 pounds of seed exported from the United States in the calendar year 1925, 758,134 pounds went to Argentina, 544,859 pounds to Mexico, 6831 pounds to Sweden, 5097 pounds to Germany and 4198 pounds to France.

Notices were issued Sept. 25, 1926, by the Secretary of Agriculture under the Federal Seed Act to the effect that alfalfa seed grown in Turkestan and in Africa is not adapted for general agricultural use in the United States. An amendment to this Act approved Apr. 26, 1926, prohibits the importation of alfalfa and red clover seed unless the same is colored or stained in conformity with the regulations stipulated. Consult Commercial Varieties of Alfalfa, *United States Department of Agriculture Farmers' Bulletin No. 1467* (Washington, 1926) and *Service and Regulatory Announcements No. 9*, Bureau of Plant Industry, United States Department of Agriculture (Washington, 1926).

**ALFALFA WEEVIL.** See ENTOMOLOGY, ECONOMIC.

**ALGERIA.** A colony of France forming politically a part of France itself, situated in northern Africa. It comprises the two great

divisions of Northern and Southern Algeria which in turn are divided as follows: Northern Algeria into the departments of Algiers, Oran, and Constantine; Southern Algeria into the territories of Ain Seфра, Ghardaia, Touggourt, and the Oases of Sahara. The total area is estimated at 222,180 square miles; population, including military forces, according to the census of Mar. 7, 1926, 5,992,770, of whom 5,455,408 were in Northern Algeria. The Europeans numbered 864,331. All but a small fraction of the population was in the towns and cities. Chief towns with their populations for 1921; Algiers, 206,595; Oran, 146,156; Constantine, 72,220 (these three being respectively the capitals of the provinces of the same name); Bone, 45,171; Tlemcen, 43,090; Sidi-bel-Abbes, 37,752; Blida, 36,384; Tizi Ouzon, 35,171; Philippeville, 33,808; and Sétif, 30,867.

The race groups in the native population are principally Arabs, Berbers, and Kabyles, and the prevailing religion is Mohammedanism. The chief Christian church is the Roman Catholic which maintains an archbishop and two bishops. For higher education there is a university at Algiers, with an attendance in 1924 of 1489 students, and there are special schools of commerce, hydrography, agriculture and the fine arts. There are also higher Moslem schools at Algiers, Constantine, and Tlemcen. Primary and infant schools in 1924 numbered 1485 (public and private) with 108,090 pupils.

**PRODUCTION.** Cereal crops in Algeria frequently have alternations of good and bad years. The yield in 1924 was particularly poor, but in 1925 quantities produced were not only twice as great as in the preceding year but also considerably higher than in 1923. The wine yield of the country improved somewhat as compared with 1924, but conditions for marketing were not particularly favorable, and profits realized were unsatisfactory. An attempt was being made to extend the production of more essential crops. The raising of esparto grass, used in paper making, has been decreasing steadily for a number of years. Since 1913, the number of olive trees in Algeria has been increased by 1,500,000, but production of oil has not been noticeably increased. The cork industry, which was dealt a heavy blow by the War, has been steadily recovering since 1920, and the production of cork by 1926 had regained figures comparing favorably with the pre-war output.

The manufacturing industries in Algeria are not highly developed. The production of alcohol is steadily increasing, however, partly as a result of recent uncertainty in the wine market. The tobacco crop of 1925 was a record one, and tobacco manufacturing is steadily increasing. Algeria now ranks eighth among world producers of tobacco. The production of geranium oil is becoming a considerable industry. An attempt is being made to improve native carpet making, and several factories have recently opened by the French to employ native girls and women in this industry. Most of the output is shipped to France. The mining industry is developing gradually. The production of iron and zinc ores and of coal, petroleum, and phosphates increased in 1925. A larger output of lead and zinc ores would find a ready market, and further concessions have been granted for lead, zinc, and iron mines. See table of production by countries under AGRICULTURE.

**COMMERCE.** The total Algerian import trade advanced in value from \$128,799,000 in 1913 to \$152,310,000 in 1925 (based on \$0.193 to the franc in 1913 and \$0.0465 in 1925). Exports showed a similar though less striking advance from \$96,726,000 in 1913 to \$111,778,460 in 1925. Like other colonial countries, Algeria is obliged to import a large proportion of the manufactured goods it uses. Textile products form the most important item of this class. Imports of linen, silk, and jute also reached considerable proportions. Other imports are automobiles, machinery, metal products, sugar, wood and lumber, gasoline and kerosene, and fertilizers. Exports consist mainly of the products of the soil and subsoil or are dependent upon them. Various kinds of wines and liquors occupy first place. More than one million sheep were exported in 1925. The cereal crops of Algeria in normal years supply a considerable surplus for export. Among the agricultural products other than foodstuffs in the Algerian export trade are cork, tobacco, goat and cattle hides, palm leaf, and esparto grass.

**FINANCE.** The budget estimates for 1926 were: Revenue, 485,138,192 francs; expenditures, 484,986,772; in each case an increase of approximately 100,000 francs over the preceding year. The chief sources of revenue in the 1926 budget were taxes of various kinds, posts, telegraphs, and telephones, and stamp and other duties. The principal items of expenditure were service on the public debt, administration, education, and public works.

**COMMUNICATIONS.** In 1924 there were 2564 miles of railway open for traffic. The receipts for that year amounted to 172,774,205 francs. In 1925, 4067 vessels of 6,239,459 tons net entered Algerian ports and 4523 vessels of 6,832,229 tons cleared. In 1924 the merchant marine of Algeria consisted of 414 vessels of 22,108 tons net.

**GOVERNMENT.** The central executive authority of the local government is the governor-general who directs all the services with the exception of the non-Mussulman departments of public instruction, justice, worship, and the treasury, which are each under a separate minister. The governor-general, with the minister of the interior, prepares the budget which is voted by the so-called Financial Delegations and by the Special Council. The colony sends to the home parliament one senator and two deputies for each department. Governor-general at the beginning of 1926, M. Maurice Viollette (appointed May 12, 1925).

**ALLEGHENY COLLEGE.** An institution of the higher learning at Meadville, Pa.; non-sectarian in policy but under the patronage of the Methodist Episcopal Church; founded in 1915. The enrollment for the fall of 1926 was 601, distributed as follows: graduate students, 1; seniors, 121; juniors, 136; sophomores, 146; freshmen, 196. For the 1926 summer session the registration was 97. The faculty numbered 39. The productive funds of the college amounted to \$1,300,000, and the income for the year was \$284,682. The library contained 65,000 volumes. During the year a new central heating plant was erected at an expense of about \$150,000. James A. Beebe, D.D., LL.D., was inaugurated as president during the year.

**ALLIANCE FRANÇAISE, FÉDÉRATION DE L'.** An association of clubs and groups formed for the purpose of encouraging and furthering

the study and cultivation of the French language, literature, art, and history in the United States. It was established in 1902, and in 1926 comprised over 230 local branches, including French Alliances, affiliated societies, and French clubs in universities, colleges, and schools. Eleven new groups were added to the Fédération during the year. Each year the Alliance Française brings from France as official lecturers, one or more eminent men of letters who are prepared to speak before all the affiliated societies and clubs wishing to hear them. It also organizes lecture tours for distinguished French travelers, and for French lecturers who live in America. It assists in organizing courses in the French language and literature, in coöperation with the leading universities, and encourages its groups to engage in dramatic performances and debates in French. The official lecturers from France during the year 1925-26 were M. Charles Castre, Professor at the Sorbonne, and M. Benjamin Vallotton, well-known writer and journalist. In 1925, the French Academy awarded Le Grand Prix de la Langue Française, its most important award, to the Fédération. This prize formed the nucleus of the Permanent Endowment Fund of \$100,000, of which \$40,000 had been raised at the end of the year. The Assemblée Générale of the Fédération was held at the Hotel Plaza, New York City, on April 10th, 1926, and was attended by representatives of the various groups. The official organ of the Fédération is *L'Echo de la Fédération*. It issues annually its *Bulletin Officiel*. Headquarters are at 32 Nassau Street, New York City. Officers for 1926 were: Frank D. Pavey, president; William Nelson Cromwell, general vice-president; Albert Blum, president of the executive committee; Maurice Mercadier, treasurer; Felix Weill, general secretary.

**ALPHONSA, MOTHER MARY.** See LATIHOR, ROSE HAWTHORNE.

**ALSACE-LORRAINE,** al'zäs'lör'an'. The provinces taken from France by Germany after the Franco-Prussian War of 1870-71 and restored to France after the armistice of Nov. 11, 1918; constituting at present the three French departments of Bas-Rhin, Haut-Rhin, and Moselle. Total area, 5605 square miles, total population in 1921, 1,709,749. The area and population are distributed among the three departments as follows: Bas-Rhin (formerly Lower Alsace), 1848 square miles, and 651,086 inhabitants; Haut-Rhin (formerly Upper Alsace), 1354 square miles, and 468,943 inhabitants; Moselle (formerly Lorraine), 2403 square miles and 589,120 inhabitants. The following account of the agricultural and industrial situation of Alsace and Lorraine was supplied by the United States Bureau of Foreign and Domestic Commerce. The general situation in Alsace-Lorraine was favorable in 1925, with little unemployment and with wages fairly well adjusted to the cost of living. The agricultural yield was restricted as a result of unfavorable climatic conditions. Only the wheat yield, among the cereal crops, showed some noteworthy improvement as compared with 1924, while vegetable, beet, and fodder crops, except natural hay, were also less abundant, though yielding good returns on account of increased prices. The wine crop was much reduced and of poor quality. Alsace-Lorraine contains the only petroleum fields of commercial importance in France, but supplies

only about 10 per cent of the total consumption. Iron ore is mined in large quantities and showed a gain to 15,465,514 metric tons, as compared with 12,480,652 the previous year. Potash production was affected favorably by the agreement between the Alsatian and German mines for a division of the world market. Production of crude salts in 1925 advanced to 1,926,036 metric tons, as against 1,664,764 in 1924. Coal production advanced only to a slight degree, reaching 5,279,319 as against 5,269,132 metric tons, but new workings continued to be exploited. The iron and steel industry of the Moselle district, like that of the rest of France, made considerable progress in 1925. Pig-iron production was increased to approximately 3,200,000 metric tons from 2,980,000 in 1924, while the crude steel output rose to about 2,700,000 tons from 2,364,000 tons in the earlier year. Since January, 1926, the autonomy of the port of Strassburg has been established and was expected to give a certain competitive advantage for that year.

**ALUMINUM.** The amount of aluminum in the form of primary metal produced in the United States in the year 1925 was stated by the U. S. Bureau of Mines to be valued at \$36,430,000, while the secondary metal was estimated at a value of \$24,816,000. The primary metal was somewhat less in value than in 1924, when it was \$37,607,000, but the secondary metal was greater in value, as in the earlier year the estimate was \$14,596,300. In 1925 crude and semi-crude aluminum, imported into the United

Canadian plant of the Aluminum Company of America was put on the market during the autumn of 1926, while in this year increased facilities for the manufacture of this metal were also under construction in England, France, and Norway. It was reported that the French and German aluminum makers had reached an agreement similar to that prevailing before the World War. In the United States the exports of aluminum ingots, scraps, and alloys were considerably less in 1926 than in 1925, but there was an increase in the export of plates, sheets, bars, and strips. In 1926 the imports of crude aluminum aggregated 74,878,767 pounds, valued at \$17,107,690; while the manufactures of aluminum, consisting of plates, sheets, bars, hollow ware, etc., had an aggregate value of \$394,745. The exports of aluminum in 1925 were valued at \$10,191,526, and in 1926, at \$9,193,563. In the latter year the manufactures of aluminum, including plates, sheets, bars, strips, and rods, aggregated \$4,314,323 as compared with \$4,221,858 in 1925. The domestic quoted price of aluminum 99 per cent pure was 28 cents a pound from the beginning of the year until mid-July, when it softened to 27 cents to 28 cents, and at the first of September it was at 27 cents, the same as the 98-99 per cent grade, being quoted at this figure for the remainder of the year. See BAUXITE.

*Engineering and Mining Journal* (New York) gave the world production of aluminum in the accompanying table.

WORLD PRODUCTION OF ALUMINUM  
As Reported by the Metallgesellschaft, in Metric Tons

	1913	1921	1922	1923	1924	1925
United States ..	20,900	24,500	33,600	58,500	68,300	62,000
Canada ..	5,900	8,000	10,000	10,000	8,000	8,000
France ..	14,500	8,400	12,000	17,000	18,500	20,000
England ..	7,600		5,000	8,000	12,000	15,000
Norway ..	1,500	7,000	4,900	13,300	22,000	22,000
Italy ..	800		800	1,500	2,000	1,800
Switzerland ..				15,000	20,000	22,000
Germany ..		27,000	30,000	15,900	18,700	26,200
German Austria ..				1,500	2,200	3,000
Total ..	68,200	74,900	96,300	140,700	171,700	180,000

States, amounted to 41,997,178 pounds, valued at \$9,805,645, while the manufactures of aluminum amounted to \$301,122 in value. It was the greatest amount, with the single exception of 1920 when the total value of the imports was \$13,077,022. The exports of crude and semi-crude aluminum in the United States in 1925 aggregated 12,642,034 pounds, with a value of \$3,365,815, both amounts and values being the greatest of any year since the record war year of 1918. The manufactures of aluminum exported in 1925 aggregated in value \$2,691,256, making the total value of the exports for the year \$6,057,071.

In 1926 the domestic production of aluminum was greater than in 1925 and there was an increased demand for the metal, the imports of crude aluminum being very large. In 1925 it was estimated that the automobile industry alone consumed 75,000 tons of aluminum, and, inasmuch as it increased its production during the following year, there was a corresponding demand for this metal. Likewise there was an increased call for aluminum in the electrical and paint industries, and household utensils of aluminum were in more active demand in 1926 than in 1925. The first production from the

**AMENDOLA**, a'mändölä, GIOVANNI. Italian professor and publicist, died at Cannes, France, April 6 as a result of injuries received at the hands of Fascisti in the previous July. He was born in 1884, and on entering public life espoused liberal and democratic views. During the World War he served at the front, and in the political developments and reaction resulting in Italy after the War, he was an outspoken Constitutionalist, and urged that the situation should be treated with tolerance, and not be made a pretext for depriving the Italian people of constitutional rights. In 1923 he was assaulted in Rome and beaten insensible, but his spirits were undaunted and in the March elections of 1924 he was elected in the Campania constituency. He made many notable speeches and became the recognized leader of the opposition. He published in 1924 two notable works: *A Liberal Battle and Democracy*. His work as a leader of the opposition involved the withdrawal from Parliament of himself and other liberals, as they refused to accept the Fascisti state. In July, 1925 Signor Amendola fought a duel with the editor of the *Tribuna* and shortly afterwards he was beaten by local Fascisti at Montecatini in Tuscany, whither he had gone

for the Summer holidays. Although he was able to proceed the next day by train to Rome, the assault produced permanent injuries which led to his death. That his life was threatened was recognized by the fact that the very day he was injured he was under the protection of Carabinieri, but they were unable to prevent the attack. Amendola was considered one of the few comparatively young men in Italy who would have been a figure in Parliamentary government, if normal conditions at any time should be restored.

**AMERICAN ASSOCIATIONS AND SOCIETIES.** For various scientific and other organizations whose official titles begin with the word American, see under the important descriptive word of the title.

**AMERICAN LEGION.** An organization of World War veterans chartered by Congress "to uphold and defend the Constitution of the United States; to maintain law and order; to foster and perpetuate a 100 per cent Americanism; to preserve the memories and incidents of the association in the Great War; to inculcate a sense of individual obligation to the community, state and nation; to combat the autocracy of both the classes and the masses; to make right the master of might; to promote peace and good will on earth; to safeguard and transmit to posterity the principles of justice, freedom and democracy; to consecrate and sanctify the comradeship of the members by devotion to mutual helpfulness." On September 11, 1926 the membership was 673,229. The eighth annual convention was held in Philadelphia, Pa., October 11-15, with an attendance of 1042, representing every state, the District of Columbia, four territorial and eight foreign posts. In his report as retiring commander John R. McQuigg cited the accomplishment of two major objectives during the year: one an increase in membership of 79,614 over 1925, the first time in Legion history that the membership had increased during the year; the other the completion of the \$5,000,000 endowment fund begun in 1925, the interest of which was to be used to aid disabled World War veterans and to care for the dependent children of veterans.

Among the distinguished guests at the convention were Vice President Charles G. Dawes and General John J. Pershing, both of whom made brief addresses. The Vice President declared that the American Legion, in taking up the work of increasing impartial voting in the United States, the crying need of the hour, had "again risen to the defense of our government in a time of great need, when it is faced with what may be called its greatest danger." The convention reaffirmed the Legion's faith in the fundamental principles enunciated in the National Defense Act of 1920, as amended, declined to reaffirm its position in favor of a permanent Court of International Justice, and adopted as the main objective for 1927 community betterment, each of the 10,258 posts of the Legion to seek out and accomplish an outstanding service in its own community that would best benefit every citizen. It was voted to hold the convention in France in September, 1927, preliminary arrangements for 30,000 Legionnaires to make this trip having been worked out in advance of the official action of the convention. San Antonio, Texas, was chosen as the place for the national convention in 1928.

*The American Legion Monthly* was the official publication, with offices at 2457 East Washington Street, Indianapolis, Ind. It was changed during the year from a weekly. The American Legion Auxiliary, the women's branch of the Legion, and *La Société des 40 Hommes et 8 Chevaux*, both of which have national headquarters in the War Memorial Building in Indianapolis, cooperated in the activities of the Legion during the year. The officers elected for 1926-27 were: Honorary Commander for Life, General John J. Pershing, wartime Commander of the A. E. F.; National Commander, Howard Paul Savage, Chicago; Vice-Commanders: J. G. Sims, Washington, D. C.; Thomas Busha, Helena, Mont.; Dr. John G. Towne, Waterville, Me.; Stafford King, St. Paul, Minn.; John E. Curtiss, Lincoln, Neb.; Adjutant, James F. Barton, Indianapolis; Chaplain, Rev. Joseph L. N. Wolf, Philadelphia, Pa.; Historian, Eben Putnam, Wellesley Farms, Mass.; Treasurer, Robert H. Tyndall, Indianapolis; Judge Advocate, Robert A. Adams, Indianapolis. The national headquarters are located in the War Memorial Building, Indianapolis, Ind.

**AMHERST COLLEGE.** An institution for the higher education of men at Amherst, Mass.; founded in 1821. For the 1926 fall term 707 students were enrolled, including nine graduate and special students. The faculty numbered 67. The productive funds of the College amounted to \$7,000,000, and the income for the year to \$553,000. The library contained 142,000 volumes. Morrow Dormitory, designed to accommodate 63 students and one member of the faculty, the gift of Mr. and Mrs. Dwight W. Morrow, was opened for occupancy at the beginning of the year. President George Daniel Olds presented his resignation at the October 16th meeting of the Board of Trustees. At the end of the year his successor had not been selected.

**AMMONIUM SULPHATE.** See FERTILIZERS.

**ANAEMIA, PERNICIOUS.** In the earlier attempts to diet patients with this malady, there was no thought of cure and the dietary articles were selected for their content of iron or some of the organic bloodmaking principles. By 1926 it had become possible to arrest some of the cases through the use of scientific principles of diet. In the *Journal of the American Medical Association* for August 14, there were two articles on this subject. The authors of the first, Minot and Murphy, have devised a blood regenerative diet in which full protein, iron and purin bodies figure largely and which is carried out by feeding with beef or calf liver, or sheep or lamb kidneys along with beef or mutton muscle meat; plenty of vegetables with low carbohydrate content (1 per cent to 10 per cent); raw fruits and a little butter or cream. For variety one may have an occasional egg or glass of milk. The calory requirement is to be made up with sufficient dry bread, potato and cereal. If the entire ration is too bulky at first, the patient must make sure of the liver, fruit and vegetables. The other paper by Koessler and associates differs chiefly in recommending more fats to obtain the fat-soluble vitamin (codliver oil, cream, butter, etc.). Insisted on are spinach, lettuce, oranges, tomatoes, and liver, kidney and sweetbreads as the only meats. The sole medication is dilute hydrochloric acid. In regard to the more radical measures Dr. H. W. Jones (*Journal of the*

*American Medical Association* for May 29) was satisfied that small and frequent transfusions give much the best results, due to great improvements in technic. Blood typing, which was introduced as long ago as 1890, had been improved by greater individualization through the method of cross-agglutination; so that the recipient receives blood as much like his own as possible. Transfusion must take place without coagulation anywhere and if possible without the old addition of sodium citrate; so that the Unger method seems the best. Formerly too much blood was transfused but it is no longer thought necessary to give more than 350 to 450 cc. save in unusual cases and some physicians do not exceed 100 cc. which is the best amount to give for the first transfusion. The operation should be repeated every three to five days. The author has transfused 30 patients in seven years and of these 20 are still living with 13 able to work. In several of the patients the blood has been restored to its normal status, although this is not necessary to secure improvement. See FOOD AND NUTRITION.

**ANALYTICAL CHEMISTRY.** See CHEMISTRY.

**ANATOLIA.** The name given to that portion of Turkey which corresponds to Asia Minor; the peninsula at the western extremity of Asia bounded by the Black Sea on the north and the Mediterranean Sea on the west. Area estimated at 200,000 square miles; population at approximately 9,000,000. See TURKEY.

**ANDORRA,** ân-dor'ra. One of the smallest republics in the world, under the joint suzerainty of the French president and the Spanish bishop of Urgel; situated in the valley of the Pyrenees. Area, 191 square miles; population, 5231, scattered in six villages. The inhabitants speak Catalan and are Roman Catholics. The government is under a council of 24 members which nominates a First Syndic, the executive.

**ANGINA PECTORIS.** The great number of deaths with the years of suffering from this malady have prompted efforts in the direction of early recognition and prevention through the determination of the incipient manifestations. The result has not been very encouraging thus far. Dr. Kahn of Philadelphia published in the *American Journal of the Medical Sciences* for September a report of 80 fully developed cases, of which only about one third had shown any warning symptoms and even these were vague and equivocal. They comprised fatigue, short breath and palpitation on exertion and attacks of asthma referable to the heart; heartburn and a sense of heat and pressure about the stomach and attacks resembling fainting fits with the exception that consciousness was not lost. Individual patients complained of some one symptom, but apparently none of several, which adds to the lack of value of the evidence.

In regard to the surgical treatment of this affection by division of the sympathetic nerve in the neck many more operations have been performed than have been placed on record. Dr. Coffey of San Francisco has operated on 35 patients, while Leriche, a well known French surgeon, has alone performed operations on more than 80 patients. It is not denied that marked relief is the rule after the intervention, but cases require following up over long periods before the end results can be known; while it is also possible to cause collateral injury and the

operation is by no means free from danger. In the *Journal of the American Medical Association* for June 26 there are papers by Cutler and Fine, McNealey and others with a full discussion. The first named authors believed that the operation has come to stay, although it was as yet too soon to lay down general rules as to when and how to operate. McNealey expressed the opinion that the theory and practice of the operation are alike wrong and that it should be abandoned for it carries with it difficulties of technic and is followed by mishaps. The same objections apply to all surgery in which the sympathetic nerves are divided, and before going further we must have better notions of the anatomy and physiology of the sympathetic system. Dr. A. Lambert spoke of the varied course and distribution of the cervicothoracic sympathetic and warned of excision of the stellate ganglion which may result in death from acute oedema of the lungs. Dr. Coffey already mentioned has lost no patient from the operation or the disease itself, and has obtained relief in every case; his experience extends back five years.

**ANGOLA,** ân-gô'la. or **PORTUGUESE WEST AFRICA.** A colony on the west coast of Africa, belonging to Portugal since 1575, with the exception of the years 1641 to 1648 when it was held by the Dutch. Its present boundaries were assigned by conventions of May 12, 1886, Dec. 30, 1886, May 25, 1891, and June 11, 1891, separating it from the French Congo, Southwest Africa (afterward united with the Union of South Africa), Belgian Congo, and British South Africa (now Union of South Africa), respectively. Area, 484,800 square miles; population, according to Portuguese estimates, 4,119,000, but the native population was estimated as low as 2,124,361 in 1914. Capital, Sao Paulo de Loanda; other important towns, Kabinda, Ambriz, Novo Redondo, Benguella, Mossamedes, and Port Alexander.

According to the latest educational statistics there were 52 government schools, seven municipal schools, and two private schools, with about 2410 pupils altogether. The chief products are coffee, rubber, wax, sugar, vegetable oils, coconuts, ivory, oxen, and fish. Rubber, which has been an important industry, by 1926 was nearly exhausted, and cotton growing, which in the past was highly remunerative, had declined, although recent reports indicate its revival. Mineral products include malachite, copper, iron, petroleum, and salt, and gold has also been found. The latest trade statistics are those for 1913 when the imports amounted to 242,875,490 escudos and the exports were 201,112,173 escudos. The bulk of both the export and import trade was with Portugal. Angola has its own budget, the revenues for which are largely derived from taxation and customs duties, although from time to time the home government grants a subsidy. The estimated revenue and expenditures for the year 1923-24 balanced at 203,725,000 escudos. The debt in 1924 was 464,507,225 escudos. In 1926, 818 miles of railway were open for traffic. The government is in the hands of a high commissioner vested with large powers, whose seat of government is at Loanda. The colony is divided into twelve administrative districts, each under a governor.

**ANHALT,** ân'hált. A German free state, formerly a duchy of the German Empire, bounded by the Prussian provinces of Branden-

burg, and Saxony. Area, 888 square miles; population, according to the census of 1925, 351,506. Capital, Dessau, 70,241 inhabitants in 1925. Other cities with their populations in 1925 are: Bernburg, 34,178; Cöthen, 26,588; Zerbst, 19,229; Rossau, 12,306; and Coswig, 10,089. The majority of the population adheres to the Protestant religion. The estimated revenue and expenditure for the fiscal year, 1925-26 balanced at 20,300,000 marks. The public debt on March 31, 1924 was 2,728,892 marks and the value of state property on March 31, 1925 was 250,000,000. The government under the constitution of the free state of Anhalt dates from July 18, 1919, and by the law of Nov. 6, 1922, the administration is carried on by a ministry of state consisting of the prime minister or minister president and either one or two other ministers. As a result of the election held in November, 1924, the following parties were returned to the legislature: Socialists, 15; Middle Class Party, 14; Democrats, 4; Communists, 4; and National Socialist, 1.

**ANIMAL DISEASES.** See VETERINARY MEDICINE.

**ANNAM,** än-nüm'. A protectorate belonging to France, forming a part of French Indo-China (q.v.), whose present status was established by the treaty of Feb. 23, 1886. Area, about 39,758 square miles; population in 1924, 5171, including 1986 Europeans, exclusive of the military forces. Capital Hué, with a population of 60,611; largest town, Binh-Dinh, with a population of 74,400. The population is Annamite in the towns and along the coast, while Moi tribes inhabit the highlands. The products include rice, cotton, corn, and other cereals, mulberry, the arica nut, cinnamon, tobacco, sugar, betel, manioc, and bamboo. The forest products include coffee, dye, medicinal plants, caoutchou, and cardamoms. Raw silk is also produced. Probably the most important product is rice. Of the minerals, copper, zinc, coal, hematite, iron and salt are worked to some extent. Exports in 1925 totaled 44,304,579 francs; the imports totaled 40,038,697 francs.

The nominal head of the government is the king, but actual power is vested in the French Resident Superior. French troops are in occupation of a part of the citadel in the capital. King in 1926, Vinh-Thuy, who succeeded to the throne Nov. 6, 1925. During his minority the government is in the hands of a regency Council.

**ANNELIDS.** See ZOOLOGY.

**ANNIVERSARIES.** See CELEBRATIONS.

**ANTHROPOLOGY.** With the steady growth in the number of anthropologists the year 1926 saw a full quota of special studies. There was a dearth of fundamentally important broad studies, however, and no striking new discoveries. Even the field of fossil man which supplied startling news for several years past, offered nothing beyond two uncertain finds of earliest proto-human types from Asia. African ethnography was notably absent from the record during the year.

One promising novelty of the year was the appearance of a half dozen books from the presses of American publishers of general literature. While English, French, and especially German publishers have long made it a practice, heretofore Americans have been unwilling to underwrite the cost. It must mean that a general

interest has been aroused in the reading public.

Considering the general apathy of the French to the anthropological problems of their colonies in the past, great significance may attend the establishment of a new Institute of Ethnography at the University of Paris. In conjunction with various schools a series of courses covering the whole field are offered. These have special reference to the ethnography and languages of Africa and Indo-China, in particular those of the French possessions. The intentions were to prepare colonials to collect data and equip ethnologists for administrative service. The institute was financed by contributions of the governments of France and her colonies, and was under the direction of Rivet, Mauss, Lévy-Bruhl, Delafosse, and others.

A Catholic Anthropological Conference was inaugurated at a meeting held at Washington in April to coördinate the activities of missionaries and laymen, especially in the Americas. In view of the intimate acquaintance with the natives of some of these missionaries, this promises to duplicate the excellent work of the *Anthropos* group in Vienna.

An International Institute of African Languages and Cultures was formed in London under the joint direction of the well-known African authorities, Delafosse and Westermann, to coördinate studies in that continent, primarily linguistic.

**NEW JOURNALS.** New journals continued to appear. *Publications from the Institute of Comparative Research in Human Culture* at Oslo includes such well-known names as Meillet, Vinogradoff, Jespersen, Mauss, and Boas. The *Ethnologischer Anzeiger* (Stuttgart) edited by M. Heydrich and G. Buschan represents an effort to supply for a third field what the *Anthropologischer Anzeiger* and the *Vorgeschichtlichen Jahrbuch* accomplish for theirs. It was to contain bibliographies arranged by culture provinces and brief reviews. The first number had a bibliography of North and Middle America from 1924. *Ipck: Jahrbuch für Prähistorische und Ethnographische Kunst* (Leipzig), edited by H. Kühn, added to the number of journals which have appeared in Germany to serve special interests. It remained to be seen how far so many journals could be supported by a quite limited number of anthropologists. In Munich the researches of W. S. Scheidt, E. Fischer, H. F. K. Günther, and others in Teutonic racial problems take the form of a quarterly *Volk und Rasse*.

**THEORETICAL ETHNOLOGY.** There had been a tendency in the last two decades to take into account the variability of human conduct in cultural situations. There was very little attention to this in the accounts written during the last century. Cultures were described as though they were patterns of thought and action to which every individual in the particular society conformed absolutely. The change was due partly to the recognition that conflicting testimony by native informants could not always be harmonized, but chiefly to the realization that new customs arose from the variant behavior of individuals. Cultures are now thought of as dynamic, not static: no account of standard practices does justice to the ferment in culture. The growing interest in psychology also induced the change. This is of course not uniformly apparent in all works, for the majority do not

deal with situations where psychology is explicit.

One such protest against the typological exposition is B. Malinowski's *Crime and Custom in Savage Society* (New York). Considering the variability of human nature it hits wide of the mark to speak of an "automatic submission" of the savage to the dictates of his community. Human frailties, passions, ambitions, and non-conformity are all present in savage society and the savage is torn between the task of compliance and the desire for evasion of the rules as his personal interests may demand. The individual has a wide variety of mutual obligations to his fellows; he is subject to conflicting codes and compulsions of varying degree. His personal experience determines how far he conforms or evades. Not all customs are equally law. Civil law, by Malinowski's "minimum definition," "consists then of a body of binding obligations, regarded as a right by one party and acknowledged as a duty by the other, kept in force by a specific mechanism of reciprocity and publicity inherent in the structure of their society."

The place of *Myth in Primitive Psychology* (New York) by the same author is in the main stream of everyday thought, not in an aside of intellectually constructed symbolism or literature. All the views and motives of a people appear in their tales and the tales in turn form sanctions for actions and surcease from emotions. The author, it must be noted, is not interested in the tales as literature; in fact he quite ignores the whole problem of form and literary history.

The historical scheme of the extreme diffusionist school on the Continent has heretofore been known chiefly through the writings of its Austrian branch, headed by Schmidt and Koppers, whose views differ in some particulars from those of the founder, F. Graebner. The latter's pragmatic *Methode der Ethnologie* (1911) is now amplified in an extended paper (*Ethnologie in Kultur der Gegenwart*, Leipzig, 3435). Although this appeared in 1923 it was only generally available in 1926. Starting from an analysis of south Pacific cultures, this author posits the existence of a series of culture strata found there, which can also be discriminated in the cultures of all primitive peoples. Graebner does not explain the basis of his first analysis. The most archaic culture stratum is represented by the extinct Tasmanians. This was followed by an Old Australian culture, best represented in southeast Australia and including beehive huts and patriarchal life. The third layer, the Totemistic culture, characterized by totemism with paternal descent, is found in central and eastern Australia but also in New Guinea and Melanesia. The Matrilineal Moiety culture which followed involves horticulture and exogamous matrilineal moieties; it is barely known in Australia but is rather Melanesian. The Melanesian Bow-culture is mainly restricted to that region; it includes the flat bow, pile dwellings, etc. Finally in Oceania there developed the Polynesian culture with its outrigger canoes, caste, etc. In Africa, for example, the Old Australian culture is represented by the Bushmen and Pygmies; the Totemistic is widely scattered. Graebner modifies his Oceanic scheme somewhat to make the west African culture correspond to a mixture of Melanesian Bow- and Moiety-cultures. Later African cultures are not

related to the Oceanic. In general it appears that the more primitive cultures are early waves of migration which carried whole cultures to the peripheral regions of the world, where subsequently local elaborations developed. Graebner has receded somewhat from his earlier position in that he now holds that partial diffusions take place as well as migrations of whole cultures. In this he approaches slightly the position of most American ethnologists.

The well-known views of W. Schmidt on primitive monotheism are again presented with great richness of treatment in a second edition of his *Der Ursprung der Gottesidee* (Münster, Westphalia). The first volume, the historical and critical part which alone has appeared runs to 800 pages. The three volumes to follow will present their material according to his general scheme of cultural development. The second will deal with the archaic culture stratum, the third with the religion of the patriarchal cattle raising nomads (Ural-Altaic, Semito-Hamitic, and Indo-European peoples), and the final volume with a regional presentation of the patrilineal totemistic and matrilineal agricultural societies and their later mixed forms. The present volume is noteworthy for the wide range of earlier authors subjected to critical scrutiny.

The discussion of *The Relation of Nature to Man in Aboriginal America* (New York) by C. Wissler is rather a formulation of a general law of cultural diffusion. He holds that all traits (somatic and cultural) tend to spread in all directions; appearing first at a centre from which they are diffused in simple form; subsequent elaborations appear in the same spot and are diffused in turn, but less widely. Thus distribution usually assumes a concentric zoned form. We can thus infer the relative chronology of the forms from the space relations. Areas of culture distribution tend to coincide with ecological areas, hence the zoned form is due to the relative richness of the centre where best conditions are provided for human adjustment.

A *New Objective Method for Showing Special Relationships* is proposed by Clements, Schenck, and Brown (*Amer. Anth.*, 28, 585) to indicate relation of actual agreements or disagreements between two cultures to what might have been expected on the basis of chance (correlations of mean square contingency). Applying this to Polynesia, they find a linkage of Samoa and Tonga, Hawaii and Society Is., Marquesas and New Zealand, and Society with all the others except the last. *An Introduction to Anthropology* by W. D. Wallis (New York) also appeared.

The past decade has seen a marked tendency toward reducing the number of linguistic stocks in America. A salutary warning that the methods employed are open to doubt is issued by F. Boas in *Die Klassifikation der indischen Sprachen* (*XXI Int. Cong. Americanists*, the Hague, 305). Boas shows that a number of phonetic and grammatical elements are distributed over continuous areas among languages of widely divergent stocks. This means that these elements tend to spread rather than that two stocks with the same element were differentiated from a common prototype. In fact the number of early stocks must have been much greater than at present, rather than that modern stocks are developed from a few languages.

**PHYSICAL ANTHROPOLOGY.** The announcement in September of a new find of *Pithecanthropus*

*erectus* by Professor Heberlein near the site of Dubois' original discovery at Trinil, Java, gave rise to the hope that knowledge of this first man-like type would be materially increased. It now appears that only a cast of a skull was found, with the facial parts missing, and even its geological provenience is uncertain. The first discovery of proto-human remains on the continent of Asia are a molar and premolar tooth found at Chou Kou Tien, southwest of Peking by J. G. Andersson. The fossiliferous bed in which they lay is clearly of the same age as *Pithecanthropus* (Upper Pliocene or Lower Pleistocene). How far these teeth are homoid remains to be seen (*Nature*, 1926, 491, 639, 733). A new skull of Mousterian age is reported from Gibraltar.

A comparison of *Australopithecus africanus* (the Taungs skull) with young anthropoids of the same degree of development by J. Matiegka (*Anthropologie*, Prague, 4, 38) confirms the opinions of others that this is not homoid (see YEAR BOOK for 1925, p. 39). The cranial vault resembles that of a gorilla, the profile a chimpanzee, and lack of superorbital ridges an orang, but the combination presents a new form.

E. A. Hooton suggests that the best "Methods of Racial Analysis" (*Science*, Jan. 22, 1925) consist in testing for racial homogeneity by ascertaining how closely the most frequently occurring individual types approach the means of the separate characters measured. This means a discrimination of the various racial subtypes in a population on the basis of the investigator's experience, and a determination of the certainty of the difference for each character of each type from the mean of the whole group for that character. If the difference proves real, statistically speaking, the subtype may be matched with racially pure local groups. All these comparisons are made on the basis of a combination of a large number of characters. In case of an agreement here, Hooton apparently believes, we must hold that the subtype is racially the same as the pure type with which it was compared.

An enlarged edition of A. C. Haddon's *Races of Man* (New York) and H. H. Wilder's *The Pedigree of the Human Race* (New York) pass over familiar ground.

No very new view of *The Peoples of Asia* (New York) is presented by L. H. Dudley Buxton. "Biologically the majority of the races of Asia from the extreme west to the east are closely connected with those of Europe. The distinctions between them are probably no greater than might be said to warrant the term local varieties, although in some cases the differentiation seems to be sufficient to make use of the word 'sub-race' admissible. In Eastern Asia, however, there seems to be very widely spread a group of peoples, conveniently termed Yellow man, who seem to be more remotely connected with the races of Europe. Even here the degree of divergence is to a certain extent a matter of dispute. Finally, in remote parts of Southeastern Asia there are sporadic traces of an entirely different type of man who, all ethnologists are agreed, must be considered as widely differentiated from the other two groups."

Among local studies by far the most important is A. Matsumura's "On the Cephalic Index and Stature of the Japanese and their Local Dif-

ferences" (*Jour. Faculty Sci., Imp. Univ. Tokyo*, sec. 5, 1, pt. 1). This is the first comprehensive survey of Japan. Stature and head form agree with those found through east Siberia, south China, and Indo-China. As might have been expected from their known history and geographic position, Japanese are less variable in head measurements than Koreans and more variable than the Ainu. But among themselves greatest variability is found in southwest Japan, open to contact with the mainland. Matsumura distinguishes nine local types.

Distinctions among local Chinese types are shown in the preliminary survey of P. H. Stevenson (*China Med. Jour.*, 39, no. 19). Confirming the generally accepted view, adults of north China are found to be taller and heavier than central Chinese, who in turn surpass the south Chinese. The children of South China have a shorter growing period and an earlier pubescent acceleration than the more northern groups.

The skeletal remains of the early cultures of Kansu, China, developed by J. G. Andersson, are described by D. Black (*Mém. Geol. Survey China*, ser. A, no. 5, 52) as largely of proto-Chinese type similar to modern north Chinese, with the appearance in the earlier inhabitants of features of divergent and possibly more archaic type.

A study of bodily proportions and their variability by E. V. Eickstadt (*Mitt. Anth. Gesell. in Wien*, 56, 139) is based on Himalayan natives. A contribution *Zur Anthropologie der Buschmänner* of South Africa by the late R. Martin (E. Kaiser, *Die Diamantenwüste Südwestafrikas*, Berlin, 2, 436) gives new light on this pygmy race.

The living people of California have been systematically studied for the first time by E. W. Gifford (*Univ. Calif. Publ. Amer. Arch. Ethn.*, 22, 217). The majority of them are high faced, broad headed and broad nosed, of medium to tall stature (Californian type), the taller peoples centering in the lower Colorado valley. A narrow nosed subtype of this group is found chiefly in the mountainous districts surrounding the Sacramento-San Joaquin basin and in the southern districts. Two quite separate types are set off: both narrow headed and narrow nosed, but one with high face in the south Sierra Nevada and about Los Angeles (Western Mono type), and the other low faced and of short stature centering in the northern Coast range (Yuki type). Crania from these districts conform to the living types, with the suggestion of greater roundheadedness in the latter.

A new society for physical anthropology in Germany, devoted to investigations in that country, was founded under the chairmanship of Professor Aichel. A survey of the physical types in the Netherlands was undertaken by the Royal Academy of Science at Amsterdam.

OLD WORLD PREHISTORY AND ETHNOGRAPHY. A clearer picture of the early stone age in central Asia and China is beginning to appear. T. de Chardin holds that his finds from within the great bend of the Hwang-ho River are similar to the Mousterian and Aurignacian of Europe (Upper Palaeolithic). It is likely that these date from the earliest formation of the loess deposits, corresponding perhaps to the last glaciation. N. C. Nelson's finds from the Gobi desert are also of Mousterian, Aurignacian, and Magdalenian type (*Natural History*, 26, 238, 240).

The date of the first occupation of Ceylon is set by the identification of its rudest implements as the Upper Palaeolithic by F. Sarasin (*L'Anthropologie*, 36, 75). The older Palaeolithic is well represented in India, but it appears that the separation of the island from the mainland was more complete in early times.

The existence of the two new early horizons in Egypt is noted by Flinders Petrie (*Oriens*, Paris, 1, 19). Skeletal remains from the Nile gravels may be pre-Chellean in time but are modern in type. The other remains, flints and pottery, are established as earlier than the two prehistoric civilizations known hitherto as antedating the 1st Dynasty (4200 or 5500 B.C.). These may date from 13,000 to 17,000 years ago. The pottery is thin and hard; some axes are badly polished; the flints resemble the Solutrean. This accords with the prevailing view that developments were earlier in the Egyptian focal area than in Europe.

A much needed summary of *The Upper Palaeolithic Age in Britain* has been prepared by D. A. E. Garrod (Oxford). Remains are scarce; those of Aurignacian date most abundant. Middle Aurignacian did not differ essentially from that of France and Belgium; in upper Aurignacian times there is local distinctiveness, a proto-Solutrean blade arising there to replace the typical Solutrean laurel-leaf blade of the continent. The Magdalenian period is only slightly represented, but appears in the south with important Aurignacian survivals.

As though the problems of the transition from Palaeolithic to Neolithic were not sufficiently confused, finds made near Vichy, France, by Morlet add a further puzzle. These include pottery with Aegean affiliations, clay tablets with inscriptions, and objects in a degraded Magdalenian style. S. Reinach, who dates these to 4000-3000 B.C., thinks this evidences a western origin for writing; G. Elliott Smith suggests a later date and scouts this origin. The find promises to be important (*Nature*, Oct. 23, 1900).

The extraordinary complexity of ethnic elements in the Crimea, derived from the Russian steppes (Scythians, etc.), the Mediterranean (Greeks and their successors), combined with an even more ancient connection with the Caucasus, leads B. A. Kouftine to analyze *La Demeure des Tatars de Crimée* (*Mém. Sec. Ethn. des Amis des Sciences*, Moscow). He finds on the southeast coast flat roofed, square houses having Caucasian analogues, on the steppes of Karassonbazar an earth-covered gable roofed house like those of the Black Sea steppes, in the north mountains a wooden gabled house dating from the Gothic sojourn. Double chambered houses appeared at the same time in the Balkans. Byzantine influences appear in the balconies and Ottoman in the furniture.

"Bear Ceremonialism in the Northern Hemisphere" (*Amer. Anth.*, 28, 1) centres largely in post-mortem rites, conciliatory and indirect address of the bear, belief that it is under the guidance of a spiritual controller, etc. This complex is found in much the same form through Eurasia and North America among the northern hunting peoples but not those of the Arctic littoral. Hence A. I. Hallowell believes that it belongs to an old culture stratum linking all the sub-Arctic peoples.

In a sketch of *The Oroochee Tribe* on the western shore of the Gulf of Tartary, J. A. Lopatin

(*Manchuria Research Soc.*, Harbin, misc. A, 8) makes clear their distinctness from the Udeke, a related but Chinaified tribe. The group is on the verge of extinction. They are nomadic fishermen and hunters, with conical or gabled bark houses, and use dugouts, skis, and dog-sleds. Bride purchase and the levirate prevail; social administration is in the hands of hereditary elders. Shamanism and the bear festival are of the east Siberian type. A convenient summary of the subject, *Der Schamanismus bei den Sibirischen Völkern* was published by G. Nioradze (Stuttgart, 1925).

A new edition of the late W. Crooke's *Religion and Folklore of Northern India* (New York) has been entirely rewritten to include the large amount of material accumulated since this classic appeared in 1896.

The paucity of studies of Africa this year is perhaps compensated by the fullness of P. A. Talbot's *The Peoples of Southern Nigeria* (London.) While a summary, this account is geographically extensive and contains much new material. This will undoubtedly become the basic source for this region, for in addition to extended ethnographic and historical material, a linguistic classification and local comparative studies are provided.

Substantiation for his delineation of culture areas in Africa is given by M. J. Herskovits with reference to east Africa (*Amer. Anth.*, 28, 230). The culture of this area centres in large part in a cattle complex; the cattle as wealth, as the only acceptable dowry, as the proper animals for sacrifice, associated with distinct sex or occupational tabus, etc. These features are found everywhere in the area but enter into varying relations with other elements of the culture.

The puzzling Zimbabwe ruins of Rhodesia, for which Phoenician, Sabran, and other non-African origins have been suggested, are held by P. Schebesta to be sun temples of the Manamatapa. This has hitherto been thought an entirely legendary people, but in this author's opinion they existed. In fact their culture is identical with that of Uganda (*Anthropos*, 21, 484).

A general survey of African mythology by A. Werner (*Mythology of all Races*, Boston,) assumes its independence in the face of marked agreement of the tales with those of Europe and Asia. Special studies of two west African languages, Ibo and Edo, were made by D. Westermann (*Mitteil. des Seminars f. Orient. Sprachen zu Berlin*, 39, 1, 32).

How far negro slaves in America preserved their African culture in the face of new conditions is a question of some theoretical implication. K. G. Lindblom shows that details in the ornament of the Bush-Negroes of Surinam are reproductions of those in west Africa (*Riksmuseets Ethnografiske Afdeling*, Stockholm).

What promises to be one of the most important contributions to primitive art is heralded by the publication of the first volume of K. von den Steinen's *Die Marquesaner und Ihre Kunst* (Berlin) dealing with tattooing designs. It is especially noteworthy for its thoroughness; all the widely dispersed material discovered since the first navigators having been brought together. Tattooing in this extreme Polynesian group differs markedly from the more familiar delicate spirals of the New Zealand Maori in its solid

rectangular areas arranged in bands on trunk and limbs.

A brief ethnographic study of *The Southern New Hebrides* by C. B. Humphreys (Cambridge) deals especially with the islands Tanna and Eromanga. Data on Tanna are additional to those in Speiser's published work, but hitherto nothing of importance has been known of Eromanga. Because of their marginal situation this author interprets their culture in terms of the series of migrations familiar in works on this area. Thus the woolly-haired element in Melanesia made little impression on these islands except Tanna before the appearance there of the Dual-people, which is a fusion of the same people with Austronesian speaking groups. Later the Dual-people were modified by carriers of the Kava culture from Tonga and Samoa to the northeast. An extended account of a Papuan people by W. J. V. Saville deals with the island of Mailu in east New Guinea (*In Unknown New Guinea*, Philadelphia). A distributional study of the elements of Australian totemism by E. Vatter (*Anthropos*, 21, 566) offers some differences from that of G. Rohelm (*Social Anthropology*, New York).

A collection of myths and tales from Paparata made by A. Kleintitschen (*Anthropos Ethn. Bibliothek*, 2) gives in addition a brief account of the customs of this Melanesian folk. A second series of *Folk-tales from Hawaii* has been collected by L. S. Green (*Publ. Folk-Lore Foundation*, 7). From Bougainville Strait, west Solomon Island, a collection of *Mono-Alu Folklore* (London) by G. C. Wheeler contains a number of comparative notes to other Melanesian groups.

NEW WORLD ETHNOGRAPHY. A general view of the course of cultural development carries weight only in proportion to the range of experience of its proponent, necessarily so because of the still inchoate character of culture history. It is of importance then that F. Boas has reaffirmed his belief in the separate histories of the Old World and the New in all their fundamentals, despite recent efforts to prove America the recipient of highly developed arts from across the Pacific (*XII Cong. Int. Amér.*, Göteborg, 21).

If the methods employed by V. C. Allison in fixing "The Antiquity of the Deposits in Jacob's Cavern" (*Anth. Papers Amer. Mus. Nat. Hist.*, 19, pt. 6) are generally accepted, which seems doubtful, this will be the first case in the New World of remains exactly dated in the Pleistocene. The annular rings of a stalagmite from this Missouri cavern containing cultural remains indicates its growth during a cool rainy period. As this corresponds with a particular period in the growth of a Californian sequoia the culture deposit can be dated by the tree's annual rings.

It had long been hoped that Archaeological investigations in the Aleutian Islands might give some clue to the early migrations of the Indians from Asia to America. W. Jochelson's report, delayed since 1909 (*Carnegie Inst. of Washington*, 367), shows such evidence wanting. The deep shell heaps of these islands, like earlier finds on the Pacific coast, contain remains resembling only the historic Aleut culture. Some elaboration is found in the upper layers, but Dall's culture sequence of fifty years ago is definitely negated by this careful work.

The ancient arctic culture reported by T. Mathiassen last year (see *YEAR BOOK* for 1925, p. 41) bids fair to substantiate the long stand-

ing inference that Eskimo culture differentiated in the central arctic littoral, rather than entered America full-fledged from Siberia (*XII Cong. Int. Amér.*, Göteborg, 206). By his excavations at Repulse Bay, Southampton Island, and north Baffin Land, all in the territory of the Central Eskimo, Mathiassen has shown the existence of an ancient sea-mammal hunting culture, with the use of semi-subterranean houses, in place of the recent caribou-hunting Eskimo, whose winter houses are of snow. One of the Repulse Bay sites even held a few pieces of pottery, never before known from this part of the continent. There is some evidence that this "Thule culture" prevailed when the land was 10-12 meters lower than at present, and continued for some time. Mathiassen holds that the recent culture is derived from the Barren Ground, that some of the Thule people went to Greenland, others to south Baffin Land and Labrador, and still others to the arctic archipelago. Indeed, the recent culture of Pt. Barrow, north Alaska, is more closely related than that of the Central Eskimo. In this view a homogeneous Eskimo culture existed from Alaska to Greenland and on account of an expansion from the interior this was superseded in the central regions by a culture represented by the Central Eskimo. K. Birket-Smith agrees in the main (*loc. cit.*, 190) but holds that the proto-Eskimo culture was one of inland lakes and rivers, later adapted to sea life, spread eastward (as in the Thule culture) and was finally influenced on the coast by recent advances from the interior. At Wales in extreme west Alaska, D. Janness found Eskimo ruins of four distinct prehistoric periods. The remains of the second period coincide very closely with the oldest known culture of arctic Canada. Subsequent excavation on Diomedes Island confirmed these finds and revealed a still earlier culture, noteworthy for the use of curvilinear engraving.

While the description of the Central Eskimo as a geographic group is still permissible, K. Birket-Smith finds it is not homogeneous in language. Three groups are recognized, the dialects of the Barren Grounds and Boothia Peninsula; the Labrador-Baffin Land group including west Hudson Bay, and the Greenland dialects (*XII Cong. Int. Amér.*, Göteborg, 197).

The distribution of a ceremony over the first salmon of the year is nearly as widespread in northwest North America as the salmon itself. E. Gunther holds that the basic idea of the rite has been diffused, but locally it conforms to the tribal ceremonial pattern (*Amer. Anth.*, 28, 605).

After a lapse of some years the tribes of the Great Lakes region again come in for attention. The material culture of *The Mascoutins or Prairie Potawatomi Indians* (*Bull. Publ. Mus. Milwaukee*, 6, no. 2) is viewed by A. Skinner as almost wholly typical of the Central Algonkin group with some Plains influences. Ceremonies in house building are more in evidence than among the more north Algonkins. In his *Ethnology of the Ioway Indians* (same series, 5, no. 4) the same author sees a tribe which closely resembles the Central Algonkin in material culture but which betrays its Siouan linguistic affiliation in social organization, ceremonialism, and religion. The viewpoint of the Fox on several phases of their own life is recorded in text by T. Michelson (*40th Ann. Rept. Bur. Amer. Ethnol.*) perhaps the most unique being the autobiography of a Fox woman.

For forty years a large literature has been amassing on the highly involved social and ceremonial organization of the Pueblos of southwest United States, but with the exception of A. L. Kroeber's *Zuni Kin and Clan* there has appeared no guide through the maze of details. This year brings E. C. Parsons' *The Religion of the Pueblo Indians* (*XXI Int. Cong. Amer.*, The Hague, 140). A single system pervades all the pueblos but its elements are variously combined. Ceremonial organization is under a single town chief in the west; one for winter, another for summer in the east. Societies are represented everywhere; the greatest differentiation of their functions has taken place at Zuni. The ceremonial calendar is seasonal, turning on the solstices, with a fixed series of rites. Zuni again is the centre of the mask cult; to the west secret and secular rites are separate, to the east they are confused. "Ceremonial is a kind of ritual kaleidoscope," but there is a clear ritual pattern. The same pantheon exists in all the pueblos, but the emphasis differs widely. Definiteness and order are the prevailing habits in Pueblo religious thought.

*The Pueblo of Jemez* (New Haven) is the first of the eastern Pueblos to be known in any detail because of their hostility to investigation. Unlike the more easterly Pueblos, according to E. C. Parsons, Jemez resembles the western groups in having clans, but exogamy is not strict and other functions limited, such as to suggest a marginal occurrence of the clan idea. Unlike the west where men reside with their wives' families, Jemez men are the householders. In ceremonial there is a balance of western and eastern features. This work is another instance of the value of the genealogy-census method.

A series of papers on the central Californian tribes issued in *Univ. Calif. Publ. Amer. Archaeology and Ethnology* is the largest connected group of contributions appearing this year. E. W. Gifford shows several unexpected matrilineal strains in *Clear Lake Pomo Society* (v. 18, no. 2): inheritance of chieftainship, affiliation with chiefs, and relations within the joint houses. Villages comprise several blood groups. Surprising for an Indian group, monogamy is strict. In his *Pomo Folkways* (v. 19, no. 2) E. M. Loeb has cleared up much of the confusion in central Californian religion by discriminating the Ghost religion from the Kuksu or God-impersonating cult. In *Miwok Cults* (v. 18, no. 3) E. W. Gifford finds an earlier Bird cult overlaid and partly absorbed by the later introduction of Kuksu dances. The Bird cult, hitherto undescribed, centres in a special attitude toward raptorial birds and is southern in its distribution. In addition to defining the *Historic Aboriginal Groups of the Californian Delta Region* (v. 23, no. 2) W. E. Schenck, with E. W. Gifford, shows that the *Archaeology of the Southern San Joaquin Valley* (v. 23, no. 1) affiliates with coastal south California. W. E. Schenck's *The Emeryville Shellmound* (v. 23, no. 3) is essentially a study in method. Its importance for culture history lies in assigning a possible maximum age of 1000 years for the accumulation of the mound. The San Francisco bay mounds, including this, had previously been assigned an age of 2500-3500 years. B. Oettking reports that the *Skeletal Remains from Santa Barbara, California*, for which great antiquity was claimed in 1923, are of the historic Indian type (*Indian Notes and Monographs*, 39).

Mythologies of two areas in North America have appeared; H. K. Haerberlin's *Mythology of Puget Sound* and R. H. Lowie's *Shoshonean Tales* (*Jour. Amer. Folk-Lore*, 37). In an introduction to the former, F. Boas points out that the transformer tales form a group characteristic of Vancouver Island and Puget Sound, mythical figures of the northern coast appear here, and the tribes of the east Sound are deeply influenced by the tales of interior tribes. Lowie's is the first extensive collection from the Great Basin area, from which material has been sadly lacking.

The Maconxoc ruin in Yucatan, investigated by E. S. Thompson and J. Charlot, may be the oldest known centre of Maya civilization. Inscriptions fix its date at 364-413 A.D.

An obviously important region for cultural connections between the American continents is north Colombia south of the Isthmus, but it remains practically unexploited. J. A. Mason finds at Santa Marta a modified Andean culture with Isthmian, Orinocan, and Antillean leanings (*XXI Cong. Int. Amer.*, 159). Under the caption *Pottery of Costa Rica and Nicaragua* (*Contr. Mus. Amer. Indian*, 8), S. K. Lothrop gives a résumé of the culture of the local tribes as well. It is of some interest that this author finds Spinden's Archaic culture, postulated as the basic culture horizon of middle America, is not represented in this region.

A very full account of *The Cayapa Indians of Ecuador* (*Indian Notes and Monographs*, 40) is the fruit of S. A. Barrett's expedition in 1908.

In an analytic article P. Rivet proposes an interpretation of the cultures of northwest and west South America in terms of a series of migrations (*XXI Cong. Int. Amer.*, Göteborg, 1). The most ancient basic elements are from east South America, traces of which are in the coastal shell mounds, overlaid by successive influxes of traits. The second is possibly Malayo-Polynesian (including e.g. the Pan's pipes). The fourth brought the majority of the higher arts from Central America, the cultivation of maize and manioc belonging to this stratum. The remaining four are either local or from the east; e.g. bronze from Tiahuanaco, urn burial from the east, while the Incan civilization developed locally. Strictures on Rivet's position are made by M. Uhle in *Los Elementos Constitutivos de las Civilizaciones Andinas* (*Anales Univer. Central del Ecuador*, 36). He sees rather Mexico and Central America as the principal sources throughout the whole prehistoric period from which influences have flowed. In part the difference turns on a difference in chronology: Rivet, for example, holds that bronze made its appearance only as late as 900 A.D., Uhle as early as 400 or 500 A.D.

A broad scheme for the succession of cultures in Peru has been projected by A. L. Kroeber as the fruit of his recent typological studies of pottery (*Univ. Calif. Publ. Amer. Arch. Ethn.*, 21, no. 5). Four general periods are recognized: pre-Tiahuanaco, Tiahuanaco, pre-Inca, and Inca. Three distinct styles of the first period show developments in the north and south, with central Peru backward. Pre-Inca is also a period of local styles; the other two more general. On the north Peruvian coast, e.g., the Proto-Chimu style of the first period is characteristic of the Trujillo-Chimbote region; Tiahuanacan influence is traceable only as far north as Trujillo, while

Late Chimú ware of the Inca period is generally distributed south to Nazca although most prominent in the extreme north. Other *Culture Stratifications in Peru* (*Amer. Anth.*, 28, 331) yield to the same investigator. At the great pyramid of Aramburú in the valley of Lima he found the Sub-Chancay type of pottery superimposed on the Proto-Lima type. Further south on the coast, in the Cañete district, he found Sub-Nazca antecedent to Late Chincha ware. An association with bodily differences was also discovered; Sub-Nazca skulls show heavy frontal compression, those of Late Chincha light occipital deformation. *An Archaeological Collection from the Rio Loa Valley, Atacama, north Chile* (*Oslo Ethn. Mus.*, 5, no. 1) may show an early culture since Incan influence is absent. On the other hand, according to G. Montell, it is connected with Tiahuanaco, the coast cultures of Chili, and Puna de Jujuy to the east.

Two zones of pottery making are defined by S. Linne's comprehensive study of *The Technique of South American Ceramics* (Göteborg), dividing on the line of the eastern Andes. The eastern pottery is usually woman-manufactured, crude and primitively fired. That of the Andean area is a skilled product, professionally produced by men, highly modeled or shaped in moulds, slipped and well fired. Yet both have their roots in ancient techniques still represented in the eastern area. Both this origin and many developments are traceable to Central America.

*The Secret of the Peruvian Quipus* (Göteborg) E. Nordenskiöld finds to be puzzles for the dead to solve or magical forecasts. It has long been recognized that these knotted strings are numerical records. Their solution seems to rest on the recognition of combinations of the number seven, together with the days of the solar year and the synodical revolutions of Venus, Mercury, Jupiter, and the moon.

In an important preliminary survey of "Culture Diffusion and Culture Areas in Southern South America" (*XII Cong. Int. Amér.*, 406) J. M. Cooper describes the archaic culture of the whole region in the present Fuegian situation, somewhat differentiated east and west of the Cordillera. This was subsequently overlaid by a southerly drift of traits as far as the Araucanians on the west and the Tehuelche, north of the Straits, on the east. Local diffusion occurred in the extreme south, but the most considerable of later influences were those of the historic period bringing the plank boat down the west coast and the horse through Patagonia, each with many associated traits.

An interesting estimate of the aboriginal population of America in pre-Columbian times has been made by K. Sapper (*XXI Int. Congr. Amér.*, the Hague, 95). Of a total of 40-50 millions, there were in North America north of the limits of cultivation  $\frac{1}{2}$  million, to the Mexican boundary 2-3 million, Mexico 12-15, Central America, 5-6, West Indies 3-4, in the tropical Andes 12-15, tropical east South America 2-3, and in temperate South America 1-2 million. The population was massed in the west highlands of both continents. The total to-day is only 15-16 million.

EXPEDITIONS, PERSONALIA. South America was again the field of the Gothenburg Museum expeditions. C. Ninuendajú continued his work on the archaeology of the Amazon and the ethnology of Mura begun in 1924. At the end of the year E.

Nordenskiöld left for Panama, Colombia, and Venezuela to investigate the influences of Central American culture on the Amazon. The formation of a new museum of Chinese culture was under way in Stockholm, based largely on the collections of Andersson and Sirén. The Naturhistoriska Riksmuseet in Stockholm added the important collection of G. Moberg from the Sahara and Lake Tsad, and another from the Lengua of Paraguay. F. Bryk collected near Mt. Elgon, east Africa, on their behalf. The Copenhagen Museum added the Eskimo collections of K. Rasmussen. An expedition to the pygmy tribes north of Carstensz Mt., Dutch New Guinea, was undertaken by M. W. Stirling jointly with the Indisch Comité voor Wetenschappelijke Onderzoekingen te Weltevreden (Amsterdam). The Museum für Völkerkunde at Leipzig had expeditions in Finnish-Lappland. It added a large collection of middle-German puppet-shows. The Staatliches Forschungsinstitut für Völkerkunde at Leipzig had an expedition in further India. F. Termer (Würzburg) began the second half of his year's journey in north Guatemala for the Geographical Society of Hamburg. The Naturhistorisches Museum in Vienna is still financially unable to outfit expeditions but has acquired two good old South Sea collections. Objects from the Somali (northeast Africa), made by Puccioni and Stefanni under the auspices of the Géog. Italienne, were added to the collections of the Soc. Italiana d'Ant. e Ethnol. in Firenze.

Activities of American institutions continued unabated, principally in the local field. Of students at Columbia University, R. Bunsel studied the language of the Zuni and M. Jacobs, Sahaptin dialects; T. Adamson visited the Cowlitz. The Field Museum at Chicago continued to have A. L. Kroeber investigate Peruvian archaeology, R. Linton Madagascar ethnology, and the joint expedition with Oxford University to Mesopotamia. The American Museum of Natural History (New York) continued work in the Cañon de Chelly, New Mexico, under E. H. Morris. N. C. Nelson investigated Neolithic remains in the Yangtze valley, China, for this institution. The Peabody Museum (Cambridge) had C. B. Cosgrove excavating in the Mimbres valley, New Mexico, and W. B. Cline surveying the Sudbury valley, Mass. H. S. Spinden with J. A. Mason investigated the coast ruins of north Yucatan and collected from the Puya. C. Peabody explored a Neolithic site near Breuil-le-sac, north of Paris. C. Coon carried on a reconnaissance in Morocco. M. Luther made anthropometric and sociological studies of Finns. A. M. Tozzer and E. Hooton carried on studies in race mixture with the help of the Bureau of International Research.

The 1926 expeditions of the Bureau of American Ethnology and the U. S. National Museum were with one exception archaeological. J. W. Fewkes excavated Eldon pueblo near Flagstaff, Arizona; G. Fowke near Marksville, La.; H. B. Collins, Jr. in the mounds of Louisiana and Mississippi; J. P. Harrington in S. California, and J. W. Gridley explored fossil beds near Vero, Florida. For further associations of human remains with Pleistocene fauna, see YEAR BOOK for 1925, p. 41. Archaeological reconnaissances were made on the Columbia River by H. W. Krieger, and for traces of Asiatic-American connections in Alaska by A. Hrdlička. Ethnologic researches were made among several Algonkin tribes by T. Michelson. S. G. Morley continued

explorations in Yucatan for the Carnegie Inst. of Washington. The activities of the Museum of the American Indian (New York) also covered a wide field. The archaeology of Salvador occupied S. K. Lothrop, of Pueblo Grande, Nevada, M. R. Harrington, with C. O. Turbyfill excavating in North Carolina, and F. H. Saville in New York. For the same institution E. H. Davis and G. W. Avery visited Sonora and Sinaloa, Mexico, and Messrs. Fawcett and Gow-Smith made ethnological collections in Brazil. P. Radin studied the Ojibwa for the Univ. of Michigan Museum. E. S. Thompson and J. Charlot studied ruins in Yucatan for the Carnegie Institute.

Despite its meagre funds, the University of California had eight expeditions, principally in the local field. E. W. Gifford visited the Pomo and Cocopa, A. H. Gayton the Yokuts, R. H. Lowie the Washo, F. B. Kniffen the Achomawi, and L. Spier the Klamath. E. M. Loeb investigated the ethnology of the Mentawi Is., Dutch East Indies. J. Steward conducted excavations on the Columbia River. For the Univ. of Washington R. Olson continued to investigate the Quinault.

The Victoria Memorial Museum (Ottawa) conducted researches of Tsimshian social organization through C. M. Barbeau, of the archaeology of Diomed Island and Wales in Bering Strait through D. Jenness, in Ontario through W. J. Wintemberg.

The Dirección de Arqueología de México, which assumed the activities of the former Dirección de Antropología, had E. J. Palacios investigating ruins in Chiapas and furthered archaeological work at Tenayuca, Chichen-Itza and near Teotihuacán. For the Brazilian Museu Nacional (Rio de Janeiro) H. A. Torres studied the anthropometry and ethnology of the Sambaquis of Iguape, São Paulo, and Roquette-Pinto the anthropometry of the Brazilian population.

H. Hamilton visited the Kaiangaia carvings, New Zealand, for the Dominion Museum at Wellington. T. R. Heroa of the same place studied anthropometry and material culture in the Cook Is., especially Aitutaki.

The new foundations for anthropology in Australia got under way this year with the establishment of the continent's first department of anthropology at the University of Sydney under A. R. Radcliffe-Brown. Funds provided by the commonwealth, the several states, and the Rockefeller Foundation made an extensive programme of research possible. W. L. Warner was appointed to assist in this. The University of Adelaide started a museum and formed a society to study the natives. An expedition will soon leave for central Australia.

Changes occurred in the housing of several museums. The ethnological museum of the Koloniaal Instituut in Amsterdam was opened on October 9th; the Museum für Völkerkunde in München opened in new quarters on July 10th. The museum of the Società Italiana d'Antropologia e Ethnologia in Florence was installing its Asiatic and American collections in a new home in the Palazzo Nonfinito. The Museum of the American Indian in New York began construction of a new unit in March.

The XXII International Congress of Americanists met at Rome at the end of September. German and French scholars were noticeably absent. The Bernhard-Hagen medals were presented to Professor Sarasen and Dr. Bushan on the oc-

casión of the celebration of the twenty-fifth anniversary of the Frankfort Society for Anthropology. E. Nordenskiöld and K. v. d. Steinen were named honorary members of the Société des Américanistes de Paris in February, 1926.

Changes in personnel include the appointment of E. Fischer as director of the Institute for Anthropology being organized at Dahlen, Germany. The directorship of the Museum für Völkerkunde (Leipzig) developed on F. Krause on the death of K. Weule. R. Heine-Geldern was appointed at the University of Vienna to lecture on South Asia, E. Schneeweis at the University of Belgrade for comparative ethnology, and M. C. Burkitt in the recently established Faculty of Archaeology and Ethnology at Cambridge. The Museum für Völkerkunde (Munich) added M. Kusters as assistant for Africa. The staffs of two American museums showed signs of growth for the first time in years. The American Museum of Natural History (New York) added H. Shapiro for physical anthropology and M. Mead for Oceania. The Field Museum (Chicago) added W. D. Strong for North America, E. Thompson for middle America, W. D. Hambly for Africa, and H. Field for physical anthropology. D. Jenness was appointed chief of the Division of Anthropology, Victoria Memorial Museum (Ottawa) and D. S. Davidson instructor at the University of Pennsylvania.

**NECROLOGY.** Karl Weule, professor at the University of Leipzig and director of the Museum für Völkerkunde in Leipzig, died April 19th. Sir William Ridgeway, Disney professor of archaeology at Cambridge University, and William T. Brigham, for many years director of the Bishop Museum, Honolulu, died early in the year.

**ANTIGUA.** See LEEWARD ISLANDS.

**ANTIOCH COLLEGE.** A non-sectarian, co-educational college at Yellow Springs, O.; founded by Horace Mann in 1853. The number of students enrolled for the fall term of 1926 was 692, of whom 512 were men and 180 women. The faculty had 62 members. The productive funds of the institution amounted to \$138,310, and the income for the year was \$299,118. The library contained approximately 20,000 volumes. Based on the belief that academic training alone does not fit a young person for life, the college is so organized that the students divide their time between school and practical work as part of the economic community. President, Arthur E. Morgan, D.Sc.

**ANTI-SALOON LEAGUE OF AMERICA.**

A federation of churches and temperance organizations in the United States, united against the beverage liquor traffic. It was established in 1895 by a coalition of the Anti-Saloon Leagues of four States and the District of Columbia. At the end of 1926 it embraced 29 States or Territorial Leagues and had affiliations with 40 other national temperance organizations as well as with the World League Against Alcoholism (q.v.). During the year the work of the League was carried on by over 1500 representatives. This work included a widespread educational campaign on the evils of the use of alcohol and the duty of observance of the law carried on through the press, pamphlets, the pulpit, and the lecture platform. The League claimed that the public sentiment thus aroused in favor of prohibition registered itself in the election of 26 United States senators with dry records or dry posi-

tions, out of the 35 elected; the re-election of 296 dry members of the House of Representatives; and the election of 25 drys among the 39 new members of the House. The legislative work of the year included supporting: the Reorganization bill, providing a bureau of prohibition and a bureau of customs in the Treasury Department, passed by the House and at the end of the year on the Senate calendar with a favorable report; the favorable reports by committees on the Goff bill to amend and strengthen the National Prohibition Act, on the Senate calendar at the end of the year; the bill providing for Civil Service for prohibition agents, passed by the House during the year, and also put on the Senate calendar; the Alien Deportation bill, passed by the House and at the end of the year, before the Senate Immigration Committee; the Stalker Bill to increase penalties for law violations; and a Senate bill to permit employment of retired army, navy, or marine officers in the prohibition service. Both of the latter bills were pending at the end of the year.

As evidence of the unaltered attitude of the courts toward enforcement of the 18th Amendment, the League cited the decisions of the Supreme Court upholding the constitutionality of the limitations of the National Prohibition Act on the prescription of liquor for medicinal purposes, and the upholding of the discretionary powers of the Internal Revenue Commissioner in the granting of permits authorizing the use of alcohol for non-beverage purposes.

The League issued statistics based on official reports, demonstrating that the consumption of intoxicants had dropped to a small fraction of its former total. It also quoted some census figures showing a decrease in the death rate from liquor during 1926. The *American Issue*, published at Westerville, O., is the official organ of the League, both a national edition and many state editions being published. Its monthly circulation was about one million copies. The National Legislative Headquarters are at 30 Bliss Building, Washington, D. C., under the direction of Wayne B. Wheeler, general counsel and legislative superintendent. The other officers were: president, Bishop Thomas Nicholson, Detroit, Mich.; secretary, S. E. Nicholson, 70 Fifth Ave., New York; treasurer, Foster Copeland, Columbus, Ohio; general superintendent, F. Scott McBride, Westerville, Ohio; general manager of publishing interests, Ernest H. Cherrington, Westerville, Ohio.

See PROHIBITION.

**ANTI-SEMITISM.** See JEWS.

**ANTI-TOXIN.** See DIPHTHERIA.

**APICULTURE.** See ENTOMOLOGY, ECONOMIC.

**APPENDICITIS.** Mass statistics of the results of removal of the appendix show in the aggregate a small death rate. In Warnhuis's figures which appear in the *Journal of the American Medical Association* for February 13 there are 11,400 cases supplied by 35 hospitals with a total operative mortality of less than 3 per cent. The number of patients operated on in the acute stage was 5736 and here the mortality was a little higher—4.23 per cent. But if the reports of the individual hospitals are studied, we find the widest disparity despite the fact that the surgeons are of a like ability and follow presumably much the same technic and rules for performing operations. In seven hospitals the mortality was

under 2 per cent and in one large hospital with 1035 cases it was 1.6 per cent, while the record was held by a hospital with a mortality of .004 in a material of 327 cases. At the other extreme we note a hospital with a mortality of 34 per cent while in three others it was more than 10 per cent. In one hospital with but 65 patients treated 24 failed to survive the operation. These discrepancies can be explained only by delay in operating, which itself is due to a variety of factors, and to the development of unforeseen and unavoidable complications like postoperative pneumonia. The patient is often to blame because he is of the type which will not give up work until he must go on the table.

**APPLES.** See HORTICULTURE.

**AQUEDUCTS.** The continued concentration of people in large cities together with striking increase in their number, and the improvement of the standards of living, led in 1926, as in the years immediately preceding, to the discussion and construction of projects for increasing or providing new water supply systems. With the growth of cities there had also been a development of the suburbs and increased density of population in the surrounding country so that in many instances new projects involved going further distances for sources of water supply and longer and larger aqueducts to transport it to the point of distribution. New York City was seriously discussing the matter of additional water, and other cities also were face to face with the necessary extension of their supplies. Some of the more important work of the year in the field of discussion and consideration is referred to in the accompanying paragraphs.

**NEW YORK CITY WATER SUPPLY.** In connection with a plan for an additional water supply of 434,000,000 gallons daily for New York City, derived from streams east of the Hudson River, prepared by the New York Board of Water Supply and submitted to the Board of Estimate and Apportionment in the autumn of 1926, an interesting system of aqueducts was involved. Previously (Dec. 30, 1924) the Board of Water Supply had recommended the construction of a new delivery tunnel from the Kensico Reservoir to New York City at an estimated cost of \$67,249,000. This delivery tunnel, which was essential in any case and would figure in the new project, would be one of the elements of the new system. The scheme as outlined provided for a system of reservoirs, the largest of which would be on Kinderhook Creek, with a storage capacity of 44,000,000,000 gallons, with a drainage area of 150 square miles, and a daily yield of 123,000,000 gallons. These reservoirs would supply the proposed aqueduct, which, at Kinderhook Creek, would have a capacity of 150,000,000 gallons daily, while before it reached Kensico Reservoir this would be increased to about 600,000,000 gallons daily. Between Kensico Reservoir and the Hillview equalizing or distributing reservoir there was proposed an aqueduct with a capacity of 170,000,000 gallons daily, to provide for transporting the maximum draft during periods of peak consumption.

The delivery tunnel through New York City, previously mentioned, and recommended in 1924, would be a deep pressure tunnel with a diameter of 17½ feet and a length of 20.2 miles, extending from the Hillview Reservoir in Yonkers to South Brooklyn. This new tunnel would carry a portion of the Catskill supply and would obviate the

risk that is involved in using the single delivery tunnel.

Should the Board of Estimate and Apportionment adopt the plan, the following stages of construction were recommended: 1. The new delivery tunnel. 2. The aqueduct from Hillview to Kensico and from Kensico to the Croton Shed, together with the new reservoir on the east bank of the Croton River, the aqueduct from the Croton Watershed to the Silvernails Reservoir, and the reservoir on the Fishkill and Wappinger and Roeliff Jansen watersheds. 3. The aqueduct from Silvernails to Kinderhook Creek and the reservoirs on the Kinderhook, Taghkanic, Stony, Kline, and Claverack watersheds. The aqueduct from East Nassau Reservoir at the bottom of Kinderhook Watershed to Hillview Reservoir in Yonkers would total in length  $132\frac{1}{4}$  miles, its different construction being as follows: tunnel on hydraulic gradient  $53\frac{1}{4}$  miles, tunnel below hydraulic gradient  $13\frac{1}{4}$  miles, cut and cover aqueduct  $57\frac{1}{4}$  miles, reinforced concrete aqueducts  $4\frac{1}{4}$  miles, and steel pipe siphons  $2\frac{1}{4}$  miles. The total cost of the project, exclusive of the new delivery tunnel, which, as stated, was estimated at \$67,249,000, was placed at \$347,934,000, of which about \$183,000,000 would be for new aqueducts, not including the cost of gate houses and control works, and the balance for dam and reservoir construction.

The additional facilities thus provided would give an extra supply of 434,000,000 gallons per day to the Greater City of New York. This project was discussed in the *Engineering News-Record*, Oct. 21, 1926, p. 670.

**SAN FRANCISCO WATER SUPPLY.** The first pipe line to cross the southern end of San Francisco Bay for the Hetch Hetchy Water Supply project was completed and put into use during the year. This bay crossing division of the Hetch Hetchy project was built and completed seven years before it could be employed to convey Hetch Hetchy water, to supplement the pipe lines of the Spring Valley Water Company which brought in the water from East Bay sources and were already overloaded. This bay division included about 21 miles of line from a point near Irvington, on the east side of the bay, to Crystal Springs Reservoir of the Spring Valley Water Company, on the San Francisco peninsula, some 15 miles south of the city limits. This division involved the Pulgas tunnel, 8675 feet in length, a submarine pipe in the bay, a length of 2750 feet, and across Newark Slough, 400 feet in length, as well as an extended mileage of 60-inch pipe, with a capacity of 45 million gallons per day, buried in trench or laid in trestle.

In this construction the most notable feature was the crossing of the bay, where there was 3870 feet of steel bridge on the west side which terminates at an anchor pier near the ship channel, from which a 42-inch flexible pipe line was laid across the channel bottom to the east shore. This type of construction was adopted in preference to a submerged pipe line all the way on the score of ultimate economy, as the bridge which carries the pipe was designed for two 76-inch lines eventually, in place of the 60-inch line which had been installed. The approximate cost of the thrust pier and bridge complete, with the 60-inch pipe, was about \$400 per foot of bridge, or approximately equal to the cost of two lines of 42-inch flexible submarine line. Furthermore, a similar amount, at least, would

be required for each additional line of submarine pipe, whereas, once the bridge was built, the second pipe could be provided at a cost of only about \$30 per foot. The pier was designed for four 42-inch pipes, risers interconnected at the top and the bottom leading out into the bay, but only one of the four had been built and put in use in 1926. This pier also withstood an unbalanced overturning minimum of the hydrostatic thrust from two 76-inch pipe lines under a pressure of 170 pounds per square inch, and also the thrust from the submerged lines, or any combination of one or both pipe sections, either empty or full.

**EAST BAY, CALIFORNIA, WATER SUPPLY PROJECT.** During the year active progress was made on the Mokelumne Project to bring a new water supply to Oakland, Calif., and other municipalities in the East Bay Municipal Utilities District. This involved considerable construction of pipe lines and tunnels, and the first element in the work involved 42 miles of conduit from the San Joaquin River Crossing to the district. For the first 43 miles west of the river the conduit took the form of 65-inch steel pipe, with the exception of a short portion of 63-inch pipe. Then, westerly from the east portion of Walnut Creek tunnel a larger section was to be used in tunnels and conduits, the tunnel itself being half a mile long. After a 3.5 mile conduit, the Lafayette tunnel, three miles long, was planned, and finally the Claremont,  $3\frac{1}{4}$  miles in length. A notable feature of this construction was laying the 65-inch steel pipe line. It was intended at first to use butt-welded circumferential joints made in the trench, employing the oxy-acetylene process and electric welding. In the first section about 26,000 feet of the line were connected in this way, but before this amount had been finished it was apparent that satisfactory welding in the field could only be done with great difficulty, and accordingly, a change was made to riveted joints. Westward of the San Joaquin River a considerable amount of trench had been excavated, pipe had been laid and welded, and in the spring a 3600 foot length of pipe in the trench had satisfactorily passed a hydrostatic test of 197 pounds per square inch. The Walnut Creek tunnel, which had been driven and lined with concrete, was practically completed at the end of the year, and in the Lafayette tunnel active progress had been made.

During the construction of the Claremont tunnel of the East Bay Municipal Utility District project, a cofferdam designed to hold back the water of San Pablo Creek was carried away by the flood of storm water and the flood entered the tunnel through an opening made for drainage purposes. This sudden floating resulted in the drowning of ten workmen.

**LOS ANGELES AQUEDUCT.** Serious damage was occasioned to the Los Angeles Aqueduct on November 27, when, after a rainfall of  $6\frac{1}{2}$  inches in 60 hours, slides choked the open canal section above the Haiwee Reservoir, about 192 miles north of Los Angeles. The concrete lined canal was undermined by the overflow and a ditch was cut through the embankment. The damage involved considerable reconstruction with new fill, the rebuilding of the concrete sea walls and supporting embankments. The water supply of the city was not endangered, as the reservoirs were full at the time.

**ALBANY, N. Y.** Plans for a new gravity water

supply system for Albany, New York, were adopted on September 14 by the Board of Water Supply authorized at the session of the Legislature early in the year. This would involve an ultimate capacity of 70,000,000 gallons per day by the year 2000, though the plan was to develop the project by stages. Water would be stored in the Hannacrois and Catskill Creek Drainage Basins through a 59-foot dam built to a basin at Alcove, with a net available capacity of 4,400,000,000 gallons, 730 acres being flooded. Below this reservoir a conduit with a capacity of 42,000,000 gallons daily, about 40 miles in length, would lead to a new distributing reservoir in Albany. The next development would be the construction of a dam 74 feet high at Indian Fields, above the reservoir just mentioned, to flood 850 acres and form an 8,000,000,000 gallon reservoir with an aeration basin below, from which water could be sent into the Alcove reservoir or directly, into the conduit referred to. Both of these dams would be built on rock, with spillway overflow sections at the deeper part, and would be flanked with earth banks having core-walls. The Hannacrois Creek Basin, with its tributary drainage area of 32.55 square miles above the Alcove dam, would be increased by that of Basic Creek, a tributary of Catskill Creek, the water of which would be diverted into the Hannacrois Creek Basin by a 2200 foot tunnel. This would add 16.37 square miles to the drainage area, making a total of nearly 50 square miles in the system as then constructed. The next stage in the development would be the construction of two 55-foot, masonry dams on Catskill Creek, one at a point above Preston Hollow and the other at Franklinton, further above. These two basins would divert an extra 25,000,000 gallons per day from the Catskill Creek drainage, and the water from the first reservoir would be passed through a 48-inch conduit with a head of a tributary of Hannacrois Creek discharging into the Indian Fields reservoir. The upper dam, making a reservoir of 300,000,000 gallons capacity, would regulate the flow from 12.7 square miles of gathering area. In connection with the second stage another conduit, with a capacity of 42,000,000 gallons daily, would be built to Albany, and the facilities thus provided were estimated to serve the city until 1980.

Finally, as the last stage of the project, which would bring the total yield to 70,000,000 gallons daily and would provide for the water needs of Albany until about the year 2000, the Preston Hollow dam, on Catskill Creek, would be raised and water would be diverted from Ten Mile Creek. The project, as adopted, was one of four possible sources of water supply which were named by Nicholas S. Hill, Consulting Engineer, in a report submitted before the creation of the Special Water Board.

VANCOUVER, B. C. In connection with the crossing of Burrard Inlet at the second narrows by the 18-inch cast iron pipe of the third water supply conduit from Seymour Creek for the city of Vancouver, B. C., an interesting method of procedure was adopted. The pipe was put together on a chute and then pulled or pushed across by cables and pulleys operated by donkey engines located in the rear end of the pipe and chute. This third conduit extends from an intake on Seymour Creek to Little Mountain Reservoir near the centre of the Greater

Vancouver Water District. It is of  $\frac{5}{8}$  to  $\frac{3}{4}$ -inch steel and has a diameter of 36 inches and a length of about 13 miles. Where it crosses the stream an 18-inch submerged main of cast iron was employed, with a carrying capacity of 9 U. S. million gallons per day. This gap at the inlet consists of 1200 feet of completely submerged crossing and 1200 feet of tidal flat at the north shore. Previously twelve earlier lines had been laid across the inlet, but the method employed with the last pipe was found more practical.

SÃO PAULO, BRAZIL. The construction of a new water supply system for the city of Sao Paulo, Brazil, was commenced in April, 1926. It had its source in the headwaters of the Rio Claro, 42 miles from the city and about 180 feet above the distribution reservoir. The new aqueduct involved a 50-mile supply line, with 2.5 miles in tunnel, 27.5 miles of concrete aqueduct on the flow line, and 20 miles of riveted iron pipe, some of which was in siphon. There was also an impounding dam, making a lake at the upper end of the supply line, and at the lower end a reservoir. The new aqueduct was to be a gravity line and was designed by the New Works Commission of the São Paulo Water Supply. Of the 20 miles of riveted iron pipe, five miles under 57 pounds per square inch pressure were 8.2 feet in diameter and  $\frac{1}{2}$  inch thick, while 15 miles under 114 pounds pressure were 5.9 feet in diameter and  $\frac{3}{8}$  inch in thickness. The plates, varying in length from 19 to 26 feet, were to be rolled in England, where the trimming, planing, and scarfing were also to be done, and then they were to be shipped flat to Santos, Brazil, whence they were to be carried by rail to a fabricating plant where they were to be rolled and riveted, in lengths of 20 to 25 feet. In the sections in tunnel and under pressure a special form of lining was being used constructed of  $\frac{3}{8}$ -inch iron plates hydraulically pressed so as to form a series of internally flanged segments which, when bolted together, would make a continuous internal lining 8.5 feet in diameter.

JERUSALEM. One of the minor projects of the year which was put in operation in July, 1926 was a provisional water supply system for the city of Jerusalem, carrying 200,000 gallons daily from Ain Farah Springs, a distance of seven miles with a rise of 2000 feet. See WATER-WORKS and PURIFICATION.

ARABIA. A peninsula in southwestern Asia to the south of Syria, Mesopotamia or Irak and the Persian Gulf. The area is estimated at from 1,000,000 to 1,200,000 square miles, the higher figure including the Syrian desert and the Sinaitic peninsula. Estimates of the population range from 4,000,000 to 7,500,000. The divisions of the country in late years have been defined as follows:

(1) HEDJAZ. Hejaz or the kingdom of the Hedjaz was an outgrowth of the World War and after a very precarious existence was compelled to submit to the domination of the Sultan of Nejd at the very end of 1925. See preceding YEAR BOOKS. During its rather brief career as an independent state its frontiers were always in a state of flux, never being definitely defined excepting on the west. The estimated area of the country is about 150,000 square miles and more or less unsatisfactory estimates of its population place it at 800,000 to 900,000. The popula-

tion is largely nomadic, although in recent years they have been known to settle in villages where it has been possible to cultivate the soil. The principal cities are: Mecca, with a population of from 50,000 to 60,000 (this is the holy city of Islam and attracts about 100,000 pilgrims, annually. These pilgrims represent the chief source of income for the government); Medina, also a holy city and the seat of Mohammed's tomb, with a population of 15,000; and Jedda, the seaport for Mecca, with about 20,000 inhabitants.

Agriculture in the Hedjaz is not generally practicable, on account of the excessive heat, but in the oases there are large crops, the chief one of which is dates, and in the plateau region wheat, corn, barley, millet, lentils, coffee, and tobacco are raised. The country is famous for its horses many of which are raised and sold abroad. The chief exports are hides, wool, and gum; the chief imports, foodstuffs and building materials. As noted at the beginning of this article, the Kingdom of the Hedjaz ceased to exist as an independent state in December, 1925. On Jan. 26, 1926, Ibn Saud, the Sultan of Nejd, was proclaimed king in Mecca under the style King of Hejaz and Sultan of Nejd and its dependencies.

(2) **SULTANATE OF NEJD.** Undoubtedly the most important unit in the Arabian peninsula. This state occupies the highland of central Arabia between the Persian Gulf on the east and the Hedjaz on the west. It is ruled by the Saud dynasty, which represents the old Wahabite empire, founded in 1745. In 1926 the population was estimated at 3,000,000. The chief products of Nejd are dates, wheat, barley, fruits, hides, wool, horses, camels, donkeys and sheep. Although the export trade is insignificant it is capable of great development, a rapid increase being noted in the trade of horses to Bombay and camels to Egypt. The chief imports into Nejd are piece goods, tea, coffee, sugar, and rice. Reigning Sultan at the beginning of 1926, Abdel-Aziz ibn Saud.

(3) **JEBEL SHAMMAR.** An emirate north of Nejd and since 1921 an integral part of the Sultanate of Nejd, by which it was captured and annexed. Population, estimated at 250,000. Capital, Hail.

(4) **ASIR.** The principality of Asir lies on the western coast between the Hedjaz and Yemen. It is largely under the control of the latter imamate. Capital, Sabiyah. The estimated population is about 1,000,000. The ruler at the beginning of 1926 was Ali ibn Mohammed el-Ildrisi. His rule over the highlands of his country was very shadowy.

(5) **IMAMATE OF YEMEN.** The area of this state is about 75,000 square miles and the population is variously estimated from two to three millions. The capital is Sanaa, with a population of about 25,000. Cereals and coffee are raised on a large scale. Hides form one of the chief articles of export. Ruling Imam at the beginning of 1926, Yahya Mohammed Hamid ed-Din.

(6) **SULTANATE OF KOWEIT.** This territory, subsidized by the British, is on the northwestern coast of the Persian Gulf, and has an estimated population of 50,000. Sultan at the beginning of 1926, Ahmed ibn Jabir al Subah.

In addition to the above there are comprised within the limits of Arabia the British pro-

tectionate of Aden (q.v.) and the Sultanate of Oman (q.v.); also the emirate of Kerak or Transjordan (q.v.).

**HISTORY.** On Dec. 19, 1925, King Ali of the Hedjaz was compelled to abdicate his throne and surrender completely to Sultan Ibn Saud, who had been struggling for Moslem supremacy ever since the close of the World War. On Jan. 11, 1926, Ibn Saud had himself proclaimed King of the Hedjaz at Mecca. The new king was a most extraordinary and interesting character. He had always been on the strongest and friendliest terms with the British and had received a subsidy from them during the war and after it, amounting, according to reports, to \$400,000 annually. King Ibn Saud was hailed in many quarters as the new Caliph, or representative of Allah, on earth. Mustapha Kemal made this religious position the plaything of the other Islamic leaders when he declared that the Caliph in Turkey was no more.

When King Hussein and his son Ali were ousted from the Hedjaz they were compelled to give up all claims to the Caliphate and naturally, as their successor, Ibn Saud, was the strongest claimant for the religious leadership of Islam he desired to become caliph. Almost immediately upon ascending the throne Ibn Saud began a religious revival which compelled all his followers to follow absolutely the teachings of the Prophet, noontime prayers on Friday, and the five daily rites of ablution, genuflection, and prayers. He also made the way easy for the thousands of pilgrims who came to the sacred shrines at Mecca and Medina, in great contrast to Hussein and Ali who collected tremendous fees from the pilgrims for the trip from Jiddah to Mecca for their own personal fortunes. Ibn Saud charged a rate which barely covered the expenses of the trip by camel or automobile. It was fairly certain that Ibn Saud would be elected Caliph at the conference to be held at Khilafat later in the year, chiefly because he was an independent ruler and because he was in possession of the two holy cities of Mecca and Medina. These two facts strengthened his claims as against those of King Fuad of Egypt or the Amir of Afghanistan.

A very important Moslem conference was held at Mecca during June and July. The meeting was called at the instance of Ibn Saud and every Moslem country was invited to send representatives. In all about seventeen or eighteen delegations took part in the deliberations which finally worked out a skeleton of Moslem unity. The Shah of Persia refused to be represented on the grounds that Ibn Saud and his followers had violated the sanctity of the holy places of Islam and were continuing to do so. In his opening speech Saud contrasted the conditions that existed at the holy places under his régime and that of his predecessors. He stated that not for centuries had the security and physical well-being of the pilgrims been given such care and attention as under his leadership.

With regard to the Hedjaz he suggested that its independence and security be guaranteed by the entire Moslem world, and that a "closed door" policy should be maintained with respect to it, that is, no foreign concessions should be granted, all work of any description should be done by Moslems, and Mecca and Medina, particularly, should be preserved in accordance with

the strict laws of the old Wahabis—the fundamentalists of Islam.

After the congress was organized it took up the questions of hygiene and sanitation in connection with the annual pilgrimage, and made far reaching proposals and resolutions to make provisions for the cleaning up of the remains of animals used in religious rites, the providing of latrines, and a complete service of hospitals, nurses, and doctors. On the economic side a proposal was made to link up Medina, Mecca, Jiddah, and Yambo by railways, which were to be constructed and operated entirely by Moslem capital. These railways would obviate the necessity of motor and camel transportation in reaching the holy shrines.

At several of the meetings of the congress the agenda called for the adoption of a constitution to regulate future meetings, which were planned annually in Mecca, or some other Moslem city if conditions in Mecca were in any way upset. The most interesting provision of the constitution was that which provided for an executive committee to be made up of a railway engineer from Turkey, an architect from Egypt, a finance specialist from India, an educator from Syria and Palestine, a hygienist from Nejd, and a legal specialist from the Hedjaz. For some unknown reason the question of the election of the Caliph was kept in the background and no formal action was taken upon it throughout the entire conference.

In the latter part of August, King Ibn Saud published a constitution for the Hedjaz, which stated in its preamble that "The kingdom of the Hedjaz within its known frontiers is one and indivisible. It is a monarchy consultative, Moslem, and enjoying full sovereignty, both internal and external. Its capital is Mecca and its official language Arabic." The rest of the constitution provided for the absolute rule of Ibn Saud in accordance with the Koran and the laws and customs of the prophet. A viceroy was to be appointed to represent the king, who was to rule in his stead with the aid of councillors and the heads of public departments. A weekly conference was to be held in Mecca for administrative purposes and similar councils were to be arranged for Jiddah and Medina. In the rest of the country local councils were to be established.

Early in September a treaty of friendship was signed between Italy and Yemen, by which Italy recognized the "full and absolute independence of the country of the Iman of Yemen and of its sovereigns." Further provisions of the treaty promised Italian aid in commercial and industrial enterprises, and seemed to spell predominant Italian influence in the country.

#### ARACHNIDS. See ZOÖLOGY.

**ARBITRATION, INTERNATIONAL.** President Coolidge in October designated Charles Evans Hughes, formerly Secretary of State, as one of the three United States members of the International Court of Arbitration at the Hague (established in 1899), to fill the vacancy caused by the death of George Gray in August, 1925. The other American delegates to the Hague Court are Elihu Root and John Bassett Moore. Mr. Hughes was to serve for six years.

Since the publication of the volume of *The Hague Reports* (1916) by the Carnegie Endowment for International Peace, the following

cases have been brought before the Court of Arbitration:—

*Spain, France, Great Britain—Portugal:* Seizure of Religious Property. Date of Compromis, July 31, 1913. Date of Award, Sept. 2, 4, 1920. Arbitrators: Elihu Root, Savornin Lohman, Lardy.

*France—Peru:* French claims against Peru. Compromis, Feb. 2, 1914. Award, Oct. 11, 1921. Arbitrators: Ostertag, Sarrut, Elguera.

*United States of America—Norway:* Norwegian claims against United States of America. Compromis, June 30, 1921. Award, Oct. 13, 1922. Arbitrators: Vallotton, Anderson, Vogt.

*United States of America—Netherlands:* Sovereignty of the Isle of Palmas. Compromis, Jan. 23, 1925. Arbitrator, Huber, Pending.

*Commission of Inquiry: Germany—Netherlands:* Loss of Dutch steamer *Tubantia*. Date of Convention of Inquiry, March 30, 1921. Date of Report, Feb. 27, 1922. Commissioners, Hoffmann, Surie, Ravn, Unger, Gayer.

In December (1925), Spain and Portugal announced that they would submit for decision to the Arbitration Court the differences of opinion between them regarding the question of the Guadiana River.

**ARBITRATION TREATIES.** On March 5 an Austro-Czechoslovak arbitration treaty was signed. All possible disputes between the two countries were henceforth to be settled by obligatory arbitration. Judicial questions will be submitted to a permanent court of arbitration consisting of one Austrian, one Czech, and a neutral president. Appeal to the Hague Court is allowed. To this latter court all other disputes, not of a judicial nature, are to be directly submitted and ultimate appeal is then permitted to the Permanent Court of International Justice in case the settlement of the Hague arbitration should not be mutually satisfactory. Once arbitration has begun neither party may take steps prejudicing a settlement. The treaty is valid for ten years. It is then renewed automatically for another decade, unless denounced a year previous to expiration. It is understood that commercial and political relations between Austria and Czechoslovakia were also discussed during the visit paid by Dr. Benes, and that on these a basis of loyal co-operation was reached. "We have taken another big step towards the consolidation of Central Europe," the Czech Foreign Minister remarked.

In an address before the Council of the League of Nations on September 10 when he welcomed Germany to the League, M. Briand, the French Minister of Foreign Affairs, said:

Peace for Germany and for France! That means that we have done with the long series of terrible and bloody conflicts which have stained the pages of history; done with the black veils of mourning for sufferings that can never be appeased; done with war; done with brutal and sanguinary methods of settling our disputes. True, differences between us still exist, but henceforth it will be for the judge to declare the law. Just as individual citizens take their difficulties to be settled by a magistrate, so shall we bring ours to be settled by pacific procedure. Away with rifles, machine guns, cannon! Clear the way for conciliation, arbitration, peace!

A treaty between Sweden, Greece and Bulgaria was signed at Stockholm in the Spring by which Sweden places at the disposal of the Balkan States two Swedish officers to act as supervisors of the Greco-Bulgarian frontier. Greece while expressing her willingness to pay at once half of the indemnity of about £50,000

to Bulgaria, asked for a fortnight's delay for the payment of the remainder. Bulgaria agreed to this request.

**TACNA-ARICA ARBITRATION.** This arbitration (see YEAR BOOK for 1925) was at a standstill at the end of 1926. Some diplomatic conversations were carried on with a view to a possible settlement, but at the close of the year there was no definite prospect of a successful outcome. In January, Major General William Lassiter, U. S. A., succeeded General Pershing as neutral head of the Tacna-Arica Plebiscitary Commission. In December, 1925, the Commission adopted a resolution that indicated that Chile had obstructed the Commission's work. Chile objected to this and to the dates set for registration and voting. An appeal was made to President Coolidge, arbitrator, who decided that Chile's objections were not valid. Registration was postponed, however, until March 27. During the registration period of 55 days, about 5800 voters, largely Chilean, registered. Peruvian protests against intimidation by Chile caused the indefinite postponement of the plebiscite while the two countries tried to settle their difficulties through mediation in Washington. On June 14 the Plebiscitary Commission voted that a plebiscite could not be carried out. Chile was very indignant over this decision; Peru was very enthusiastic.

General Lassiter declared that the Commission was not empowered to hold "a futile plebiscite as a mere matter of form" and that the hope of obtaining "an effective expression of the will of the people has become a delusion." The Commission's power in controlling the territory was limited to requests that the Chilean government do or refrain from doing certain acts. These suggestions were ignored. He considered that there had been a "conclusive ascertainment of the fact that suitable conditions for a plebiscite, if they have existed at any time within recent years, did not exist when the Commission began its labors in August, 1925, that they do not now exist and that there is no prospect of their being brought into existence."

In a letter addressed by the Bolivian Government to President Coolidge asking for a representation in the Tacna-Arica conferences, President Siles expected to obtain, through the United States' intervention an outlet for Bolivia to the sea. President Coolidge replied to President Siles saying that in his capacity as arbitrator his duties obliged him to be concerned solely with the Governments of Chile and Peru in their dispute about the two provinces, and "owing to the lack of consent of Chile and Peru he considers he cannot invite another Government to take part in the negotiations." Secretary Kellogg submitted to Chile and Peru the following suggestions:

The territory of Tacna and Arica shall be constituted a neutralized State, either independent or under the protectorate of South American States as may be agreed, or the provinces of Tacna and Arica shall be transferred (upon an apportionment of equitable compensation and appropriate economic arrangements, to be agreed upon) to a South American State not a party to these negotiations.

Bolivia was obviously the State referred to in the second proposal, but neither Chile nor Peru evidenced the slightest willingness to sell its rights.

The main elements of the "fatally bad plebisci-

tary conditions" were the failure of the Chilean government to give Peruvian sympathizers equal opportunities with Chileans for peaceful voting, and the deterring effect on Peruvian sympathizers of "improper acts and occurrences in Tacna-Arica." General Lassiter charged that outrages had been committed against Peruvians including forcible deportations; "departures induced by violence or threats," discriminatory military conscription; failure to give Peruvians who have been driven out of the territory an opportunity to return to vote; "systematic, widespread and effective terrorization of Peruvians"; coercion of Peruvians into promising to vote for Chile, to remain neutral, or to register fraudulently; denial to Peruvians of "due and equal protection of the laws" in Tacna-Arica; subjection of Peruvians to unlawful restrictions of their plebiscitary rights; hindrance of Peruvian officials in the performance of their duties; "general and deliberate misrepresentation and suppression of the real facts by the local Chilean authorities and by the local Chilean press." General Lassiter further charged that these conditions had been brought about not only with the knowledge but with the connivance in many cases of the Chilean authorities, "as evidenced by failure to restrain the criminal activities of certain so-called patriotic or political organizations whose operations have been accompanied by unmistakable evidence of official support and approval."

Senator Edwards, the Chilean member of the Commission, declared that the Commission had no right to abandon the plebiscite and that General Lassiter's reasons for abandoning the plebiscite were not valid, since conditions had improved since August, 1925. On June 18, the Chilean Ambassador informed Secretary Kellogg that giving up arrangements for the plebiscite automatically ended the efforts to reach an amicable adjustment through mediation by the United States. On the same day General Alessandri, former president of the Chilean Republic, declared in an interview in the *New York Times* that the United States had increased the hatred between Chile and Peru and lost the friendship of Chile.

At the end of the year it was considered possible President Coolidge under the protocol of arbitration might take the question up on his own initiative, but it was uncertain whether both parties would accept the United States as mediator.

Failure to settle the Tacna-Arica questions, according to the Foreign Policy Association, "has been viewed as a blow at American prestige by many South Americans who feel that it will tend to increase the unpopularity of the Monroe Doctrine." While few responsible people had gone so far as to say that it would lead to settlement of future disputes through European or League of Nations mediation, many expressed doubt as to whether the United States will again be asked to lend her assistance.

Late in the year (November 30) Secretary of State Kellogg made another effort at settlement based on the purchase of the two provinces by Bolivia. The Bolivian Government was reported to have accepted the proposal in full and the Chilean Government "in principle." Peru, on December 6, asked Washington what part self-determination of the inhabitants of the prov-

inces would play in the suggested cession, giving no further hint of her answer. The proposal was summarized by the Foreign Policy Association as follows:

1. All previous attempts at settlement having failed, Chile and Peru shall "cede in perpetuity all right, title and interest" in Tacna and Arica, the cession to be made subject to appropriate guarantees for the protection of personal and property rights of all the inhabitants of the provinces, regardless of nationality.

2. Bolivia to give adequate compensation for the cession, including public works, railways and improvements in the territory.

3. As an international memorial to the valor of both Chile and Peru, a fitting monument is to be erected on the Morro headland of Arica, which is to be internationalized.

4. Treaties of friendship, commerce, navigation, etc., to be arranged between Chile and Peru.

5. The provinces to be perpetually demilitarized.

If Secretary Kellogg's recommendations should be carried out, Bolivia would achieve her long-desired outlet to the sea and one of the grave friction points in the western hemisphere will be ameliorated. On the other hand, as the Association points out, it is to be noted that the bulk of Bolivian ore—her chief export—is carried by a railway running through the heart of her mining district direct to the free port of Antofagasta in Chile and the preferential freight rates make this an economical route. Furthermore, the provinces of Tacna and Arica are of no particular economic value and the interest of both Chile and Peru in their possession is largely one of "national honor." Secretary Kellogg pointed out in his letter that acceptance of his plan would safeguard national honor, which has been involved, and would constitute a "high minded settlement."

**MIXED CLAIMS COMMISSION: UNITED STATES AND GERMANY.** This Commission was established in pursuance of the Agreement of August 10, 1922, for the purpose of adjudicating all claims of American nationals against Germany under the provisions of the Treaty of Berlin. There were 12,416 claims filed, in which the amount demanded aggregated \$1,479,064,313.92. On Dec. 1, 1926, there remained to be disposed of only 824 claims out of the 12,416 which had been filed. The awards entered up to Dec. 7, 1926, amounted to \$142,219,347.63, and, with interest in accordance with the awards to Jan. 1, 1927, to the sum of \$199,635,609.20. The amount demanded in the claims remaining to be adjudicated aggregates the sum of approximately \$75,000,000.

**TRI-PARTITE CLAIMS COMMISSION: UNITED STATES, AUSTRIA, AND HUNGARY.** This Commission was established in pursuance of the Agreement between the United States and Austria and Hungary signed at Washington Nov. 26, 1924, and ratified by the United States, Aug. 4, 1925; by Austria on Aug. 25, 1925; and by Hungary on Nov. 5, 1925. Its function was to determine the amounts to be paid by Austria and Hungary in satisfaction of their obligations under the treaties concluded with the United States.

The Agreement of November provided that all claims should be passed upon by a sole commissioner, and should be presented within one year from the date of the first session. The first

meeting was held on Jan. 25, 1926. At the request of Austria and Hungary, the Commissioner was selected by the President of the United States, who, on Dec. 22, 1925, appointed Judge Edwin B. Parker, of Houston, Texas. Judge Parker was Umpire of the Mixed Claims Commission, United States and Germany, Robert W. Bonyngue, of New York, was American Agent (who also represented the United States in the same capacity before the American-German Commission mentioned above) and Dr. Ernest Prosinagg of Vienna and Dr. Alexis de Boer of Budapest were the Austrian and Hungarian agents respectively. The rules of practice and procedure became effective May 14, 1926. They were designed to carry out the principle of the Agreement that the disposition of the claims shall be effected speedily and with the least possible expenditure of time and money consistent with proper presentation and adjudication of the claims. It was believed that the Commission could be wound up within six months from the expiration of the time limit for filing claims. See LEAGUE OF NATIONS.

#### ARBITRATION AND CONCILIATION.

See LABOR ARBITRATION.

**ARCHÆOLOGY.** At Cyrene the Italian Department for Colonial Affairs conducted during the year excavations which resulted in the discovery of a remarkable Græco-Roman reproduction of the head of the Olympian Zeus of Phidias. It was found in the courtyard of the so-called "Great Temple." In the same place was discovered an inscription stating that the temple was built for the Olympian Zeus.

**ASIA MINOR.** In the eastern part of Asia Minor, on the site of ancient Kanesh, Professor Hrozny, of Czechoslovakia, found pottery closely related to the Minoan. On the same site he discovered what was apparently a deposit of archives. It comprised copies of letters dispatched and letters which had been received. Besides these there were treaties, legal documents, and commercial "papers" of the great Cappadocian merchants who carried on trade between Asia Minor, Mesopotamia and Assyria. In all there were about 1000 fragments. They date around 2100 B.C. The discovery indicated that Kanesh was the leader of the other Cappadocian towns, which submitted to Assyria before the coming of the Hittites. The excavations also brought to light massive walls of brick and stone, which showed traces of burning. The building was some Hittite castle which had been destroyed by the twelfth century invaders who overthrew the Hittite Kingdom.

**EGYPT.** In Egypt several interesting things should be reported. Work was continued in preparing the articles from the famous Tutankhamen tomb. Several gilded statuettes together with caskets were recovered. At Abydos work was done on the Osireion, located behind the temple of Seti I. Evidence was now at hand to show that the building was a cenotaph of that king. The structure is a vast subterranean affair which has a hall, the central part of which is constructed of huge blocks of gray and red granite. The outer walls of the building are of sandstone and quartzite. The entrance, the eastern and the western galleries are made of a beautiful white limestone. Taken as a whole the building consists of a large, rectangular hall with long galleries at each end. Originally the western gallery had no connection with the out-

side world. An interesting feature of the main hall is that the central part forms a kind of island surrounded by a channel which originally must have been filled with water. Doubtless on this water sailed the boat of Osiris. The building is of the same date as the neighboring temple, for the retaining wall of the latter is a continuation of the outer wall of the back room of the Osireion. In this room were found two fine sculptures which represent the goddess Nut. They rank among the finest early Egyptian work.

**GIZEH.** At Gizeh the Harvard-Boston Expedition, working in the pyramid area found the tomb of Queen Hetep-Heres, of the third dynasty. She was the wife of Sneferu and the mother of Cheops. In her tomb were found a well-preserved basin and pitcher, three golden cups, twenty-five alabaster vessels as well as much pottery. The most interesting find is a gold-covered jewel case belonging to the queen. In it were twenty silver anklets, ten for each leg, so graduated as to allow for the increase in the size of the calf. Each one of them is decorated with four conventionalized dragon-flies inlaid with malachite, lapis lazuli and carnelian and separated one from the other by carnelian disks. The tomb also afforded many gold hieroglyphs which at one time were inlaid in ebony to decorate the back of a chair.

During the year restoration work was done on the Great Sphinx. Cleared away for the first time in 1700 years it was possible to see the repair work done by Thothmes IV, in the 18th dynasty.

**SAKKARA.** At Sakkara the Department of Antiquities discovered a large number of columns which had been erected in the third dynasty. So far as can be made out they formed the entrance to the wall which surrounded the pyramids. Also on this site was found a beautiful colonnade erected by the first known architect, Im-hotep. On the floor of the room at the northern end of the colonnade was found a letter in which an officer in charge of soldiers stationed at Tura, near Cairo, complains to the Vizier's office that his men had waited six days for an issue of clothing. On a wall near by some tourist has recorded that he had taken his holiday especially to come to see the wonders of Sakkara. He wrote this in the eleventh dynasty.

Also at Sakkara the explorers found a mummied horse, the first yet found, dating about 1200 B.C. It has been suggested that possibly this is the horse of Rameses II, which saved him from an Hittite ambush.

**THEBES.** The Liverpool Institute of Archaeology were engaged at Thebes where they have discovered a mummy pit at the bottom of which were three chambers. The original owner had been removed in the eighteenth dynasty and in the chamber where he had been were put thirty to forty coffins of priestesses of Amon-Ra. So hastily had they been put there that some of the mummies had been tipped out.

**KISH.** At Kish, in Mesopotamia, the Oxford-Field Museum Expedition uncovered a large structure built of rectangular bricks. This showed that the plano-convex type of brick was brought in at a later date by an invading race. The great temple complex of Harsangkalemo was cleared. It was discovered that the original building had been reconstructed by Nebuchad-

nezzar and Nabonidus. The temple shows the recessed colonnade decoration found in western Kish. Sixteen miles to the northeast other digging was done on the site of Jemdet Nasr. Work revealed that the earliest Mesopotamian civilization is to be found as far north as this. The digging brought to light many complete painted vases as well as a lot of tablets with the earliest pictographic script. The appearance of theriomorphic vases hints at some connection with Anatolia, Susa and early Egypt (1st dyn.). The writing on the tablets referred to suggest the date 3500 or earlier.

**UR.** On the ancient site of Ur the Anglo-American expedition has laid bare a great number of small houses. Some sixty odd tablets have been recovered with hymns to the moon-god dating from the time of Bur-Sin, king of Larsa (21st Cent). These were the most important finds of the expedition. On the same site the excavators also found a diorite statue of the goddess Bau, the patroness of the poulterers. It is the first archaic female statue to be discovered in Mesopotamia. In addition to this there turned up a bas-relief sculptured in two bands. In one a king pours a libation to a god; in the other a priest pours out a libation before the door of a temple.

Before the temple of Nin-Gal, the moon-goddess, was found a brick base on which stood a black diorite stele recording the victories of Hammurabi. In the hollow of king Bur-Sin were found three large stones bearing the inscription "Bur-Sin, King of Ur, King of Sumer, and Akkad, has built this temple to his lady Nin-Gal." During the digging there turned up a finely riveted copper coffin which contained the body of a woman with work-basket, jewelry, etc. It is the first metal coffin found in Mesopotamia. It dates about 700 B.C.

**BEISAN.** The University of Pennsylvania began work at Beisan (ancient Bethshan) in Palestine in August. The expedition has been able to identify two temples of the Philistines mentioned in I Chronicles, x, 10. It will be remembered that in one was put the armor of Saul, in the other his head. Four other Canaanite temples were also found. Two belonged to the time of Rameses II, one to that of Seti I and one to the Tell el Amarna period. The southern Ramesid temple was dedicated to the war-god Resheph, the northern one to the war-goddess Antit-Ashtoreth. Both buildings were in use down to the time King David expelled the Philistines. From the evidence at hand it seems that the Philistines seized Bethshan at the death of Rameses III (1167). There had been Egyptian mercenaries there before that drawn from the Aegean-Anatolian area.

At Beisan, quite a number of objects found have a bearing on the relationship of Palestine and the Mediterranean. In the lowest temple found in the Tell, just below the floor-level were discovered cartouches of Amenophis III. This is about the time the Hittites entered northern Syria. Near these appeared objects from southern Greece, Cyprus or Crete, dating in the Hellenistic III period (375-1200). At that time a Mycenaean kingdom flourished in the island of Cyprus. At the same level appeared two interesting finds—a basalt model of a Minoan chair, and a limestone model of a Minoan table.

In September, also at Beisan, a large Hellenistic temple was excavated. It was found that its

foundations cut through an Egyptian fort of the 19th dynasty. Among the things found were the monument of Ihesi-Nekht, showing the goddess Anath in a purely Egyptian dress, and an 18th dynasty stela showing a goddess with horns, like Hathor.

At Jerash was discovered a classic head of the Zeus or Asklepios model which had been made over into a head of Christ. It was found in a cloister of a Christian church which dates late in the second century.

**PALESTINE.** In Jerusalem a series of rock-cut tombs have been cleared. They are in the scarp on which the inner, eastern wall is built. The tombs date probably no earlier than 100 B.C. Also at Jerusalem the diggers found a wall nearly fifteen feet thick built of large, well-cut stones. It is part of the third, and northern, wall built or restored by Herod Agrippa.

At Wady el Amud, in a cave near the Sea of Galilee, has been found the skull of a man of the Neanderthal race. At El Zuttiyeh, in another cave have been discovered remains of the Cromagnon period.

**GREECE.** The most notable work of the year in Greece was that of the Swedish expedition which had been active in the Peloponnesus. At Asine, in Argolis, excavations in the lower city brought to light successive periods of Greek civilization. In the lower city great portions of the pre-Mycenaean town were bared. In that part of the site house foundations of the middle Helladic period (2000-1600) came to light. Fully 300 graves varying in type and age were discovered under, between, and over the walls of the houses. The finds range from pre-Mycenaean through the Hellenistic possibly down to early Christian times. It was hoped that the skulls recovered would throw light on the question whether a new race came into Greece at the beginning of the middle Helladic age. The most spectacular of the discoveries was that of a royal tomb comparable in the richness of the contents with the notable tomb of Tutankhamen. It dates about 1500 B.C. A mass of material, dating about 3000 B.C. also turned up. Some impression of the amount of the material found is given by the fact that 300 cases have been filled with pottery, marbles, bronzes, jewelry, etc. The site is revealed to have been older even than Argos.

The Swedish excavations this year were conducted chiefly on the citadel, the upper and the lower towns on Barbutia hill and in the necropolis. On the hill the tombs were cut in the solid rock.

In a beehive tomb near the town of Dendra, also in Argolis, the Swedes made their most notable find. The tomb, about 8 miles in diameter proved to have been untouched. After three weeks' work the excavators found on the floor bones of at least three skeletons and some late Mycenaean vase fragments together with gold objects, stone beads, and glass. The real finds came however when the three pit graves in the floor of the tomb were cleared. In the first appeared a skeleton with a gold necklace, bits of a gold girdle and about 40 spiral ornaments possibly also parts of the girdle. The burial was that of a little princess. In the second shaft was found an ostrich egg mounted in silver and a gold cup larger than that found long ago at Vaphio. The outside of this cup is inlaid with bronze and niello on a silver ground. This burial was also that of a woman. In the same shaft came to light

a steatite lamp, a beautiful necklace of 61 gold beads and a collection of weapons—bronze knives, spearheads and a sword. The third shaft contained the skeleton of a man completely covered with treasure. On his chest was a large gold cup 22 centimeters in height and 18 centimeters in diameter. The decoration took the form of octopi. In the cup were rings; at the feet of the dead was a sword.

**AMERICAN SCHOOL OF CLASSICAL STUDIES.** So far as the history of the American School of Classical Studies in Athens is concerned the most notable event of the year was the dedication in April of the Gennadeion, the building which houses the remarkable library given to the school by Dr. Gennadios of London. A notable task in prospect is the excavation of the ancient agora of the city which was to be undertaken by the American School in the near future.

In clearing a large area on the site of the former royal stables in Athens the Greeks came upon an ancient cemetery outside the old Themistoclean walls. Among the finds are to be mentioned a fine Corinthian capital, a beautiful statue of a draped woman over six feet in height, a headless female statue and funerary marble urns.

**CORINTH.** At Corinth the Americans again were active during the year. The orchestra of the theatre had been cleared and new sections of a polychrome wall were uncovered. The paintings show a contest of gladiators with a bull. In front of the stage much sculpture was recovered. Large marble slabs from the frieze illustrate contests between Greeks and Amazons. Bits of a Gigantomachia also came to light. The excavations resulted in proving that there were several theatres of different periods. The latest proved to be of the fourth century, the earliest of the first years of the Christian era. Traces of a Greek theatre were also uncovered. In the theatre was found a copy of the Doryphoros of Polyclitus.

**CYME.** At Cyme the Czecho-slovakian mission found the house of a potter, a fourth century Ionic temple, reservoirs for water and a Roman forum.

**NEMEA.** At Nemea the American School once more resumed its excavation of the site. The campaign had three purposes in view; the exploration of the area to the east of the temple, the examination of the Greek structure under the Byzantine church, and the location of the stadium for the Nemean games. East of the temple foundations were found which ran north and south, parallel to the front of the temple. It is thought that they are the foundations of an altar. If so it is the first of its kind in the Peloponnesus. The building under the church proved to be of great size—about 20 by 85 meters. The building, which is late, is possibly a gymnasium. The work on the site of the stadium was mostly at the north end where was found a deposit of votive offerings on the ridge bounding the valley on the east. The deposit had been carefully buried in a small pit in the rock. In it were several hundred small vases, cups, figurines of the archaic type, etc. such as have previously turned up at the Argive Heraeum, Tiryns and elsewhere. In the list were some specimens of geometric ware. But mostly the find was confined to the Proto-Corinthian and Corinthian style, its date therefore being about 700 B.C.

In the autumn of 1926 Acting Director Blegen put ninety men to work clearing the foundations of the altar found in the campaign of last season. The stadium has also been worked upon. Some excavation has as well been done in the neighboring village of Herakleia.

ITALY. One of the most interesting discoveries in Italy this year is that of Prof. Rhys Carpenter who has succeeded in showing that the seated boxer in the National Museum in Rome bears the signature of Appolonios, the Son of Nestor, a sculptor already known from his signature on the Torso of the Belvedere. The signature of the Boxer is in small letters on one of the cestuses bound on his hands.

At Agrigentum the temple of Asklepios was laid bare. It proves to be a reduced copy of the temple of Zeus. On the same site has been found an interesting bearded head of Hercules in the style of Myron.

FRANCE. In France, at St. Bertrand de Comminges, were unearthed a number of marble statues dating apparently from the earliest days of Roman occupation. One is a Victory, another that of a beautiful woman in the best Greek style, and fragments of a colossal seated Jupiter together with parts of an eagle. The evidence points to a possible capital on the site which had been destroyed in the early fifth century. Near Bordeaux have come to light a series of remarkable subterranean galleries dating possibly from the first century B.C. Many of the halls or galleries communicate by long corridors. The place may have been a fort. At Les Esyes caves dating back 30,000 years have been unearthed with carvings preserved on the walls. At Rocqueliere in the Alpes Maritimes the Duke of Vendome has found several tombs of the Roman period containing beautiful jewels, vases, etc., while at Sonnac the Abbe Hermet has found many graves and well-preserved skeletons. While laying foundations for a statue of victory the workmen uncovered seven sarcophagi with skeletons and jewelry of the eleventh century.

ENGLAND. At Bainbridge in Wensleydale, England, excavations uncovered the remains of Roman barracks which had been used as late as the fourth century. There were found evidences of a clay rampart which originally must have been topped with palisades. Among the finds should be recorded cells, roofs, bronze brooches, a surgical instrument, pieces of scale armor, counters for playing draughts, a knife, spearhead, a silver denarius of the time of Severus, and a millstone of lava.

LONDON. While sinking foundations at the corner of Lombard and Gracechurch Streets in London workmen came upon parts of the forum of Roman London. The parts discovered consist of three oblong blocks of Roman brickwork each five feet long by two and one half wide. Behind them appeared a Roman wall, the face of which has been laid bare. Possibly this is the southwest angle of the forum. The piers which have been found may belong to an arcade which enclosed the marketplace.

WALES. At Cærhun in Wales, which lies five miles to the south of Conway, excavations have been conducted on the site of the Roman fort of Kanovium, which was one of the chain of forts which extended from Chester to Carnarvon. The east gate has been found. The fort was founded soon after the Roman occupation of

Wales in the first century and continued to be used till the time of Hadrian.

GERMANY. While digging for the work on the athletic park at Cologne in Germany ruins of a Roman settlement were laid bare. Its date is in the early decades of the first century and constitutes as yet the most important find of its kind in Germany. Many baths, mostly well-preserved, were brought to light. The whole series of buildings formed a square 800 feet on a side. One cellar still contained a stove together with a complete set of cooking implements as well as utensils for the banquet hall. The place appears to have been a manor house.

RUSSIA. In South Russia on the site of Olbia the Russian scholars have found evidence going back to the sixth millenium B.C. Near Odessa traces of occupation have been discovered which point to habitation there as early as five to six thousand years B.C. The remains of earth dwellings suggest an agricultural society. See PEABODY MUSEUM OF AMERICAN ARCHAEOLOGY AND ETHNOLOGY.

**ARCHITECTS.** AMERICAN INSTITUTE OF. The national organization of the American architectural profession, founded in 1857. It is governed by officers and a board of directors elected by and responsible to the delegates from the 56 chapters, assembled at the annual convention. The objects of the Institute are to organize and unite in fellowship the architects of the United States, to combine their efforts so as to promote the æsthetic, scientific, and practical efficiency of the profession, and to make the profession of ever-increasing service to society. Among its activities are the following: devising methods for improving and extending architectural education, not only in the universities, but in the lower schools; securing proper laws for the registration of architects in the various states; developing a service for architects which will give them for their actual problems data relative to building materials and methods obtainable from no other source; maintaining a public information service to tell the prospective builder the financial as well as the æsthetic service of the architect. The Institute maintains active standing and special committees on various branches of its work and allied fields. The directors and executive committee hold quarterly meetings in various parts of the country and the regional directors keep in active touch with the work of the local chapters throughout the year.

The 1926 annual convention was held in Washington, D. C., May 5-7, 1926, at which the Institute resolved: to use its influence to promote the physical restoration of the Church of Saint Sophia at Constantinople; to undertake a new publicity programme for direct paid-for advertising for the architectural profession; to issue bonds to raise money for the improvement of the historical Octagon House and its grounds; to withdraw its support of the Architects' Small House Service Bureau; to issue a handbook presenting to the country at large the needs of Washington, i.e., the necessity of an effort to further beautify it by appropriate city planning; to offer its active coöperation toward securing a home in which foreign students of the Arts coming to this country might be welcomed.

Gifts received during the year were: \$1736 from the Allied Architects of Los Angeles for

the furnishing of the Octagon House; \$10,000 from the president, D. Everett Waid, for the Waid Education Fund, and \$6,000 for the Octagon House Property Fund from the same source; the architectural library of the late Richard Morris Hunt, given by his son; the architectural library of the late Donn Barber, given by his widow; and the architectural library of the late Arnold Brunner, given by his widow.

In May, 1926, there were 2631 members, 258 fellows, 72 honorary members, 33 honorary corresponding members, 415 associate members, and 128 junior members. Honorary members elected during the year were George F. Booth, Detroit; George F. Lindsay, St. Paul; George F. Steedman, St. Louis; Major Raymond A. Wheeler, Washington; Dr. Irene Sargent, Syracuse; Thomas E. Donnelly, Chicago; Frederic B. Pratt, Brooklyn. The Institute medals were awarded as follows: the Fine Arts Medal to Dr. Leopold Stokowski, in recognition of his services in interpretation and advancement of music in America; the Craftsmanship Medal, for pre-eminence in some special field of craftsmanship, to V. F. Von Lossberg; the Gold Medal, the highest honor of the Institute, to Howard Van Doren Shaw. The property and funds of the Institute amounted to \$235,359.98, and the income for 1925-26 was \$98,243.69. Officers for 1926-27 were: president, Milton B. Medary, Jr.; first vice-president, William Emerson; second vice-president, C. Herrick Hammond; secretary, Frank C. Baldwin; treasurer, Edwin Bergstrom. The Institute issues: *The Journal of the American Institute of Architects*, a monthly; the standard contract forms in widespread use throughout the country; the *Handbook on Architectural Practice*; a *Structural Service Book*; and a series of documents on the ethics of the profession. Its headquarters are located in the Octagon House, Washington, D. C.

**ARCHITECTURAL LEAGUE.** See ART EXHIBITIONS.

**ARCHITECTURE.** The outstanding feature of the year 1926 in American Architecture was the continuation of the process of style liberation already begun. The greatest business building of the year—The Barclay-Vesey Telephone Building, by McKenzie, Voorhees & Gmelin—the finest Memorial—the Kansas City War Memorial, by H. Van Buren Magonigle, recently dedicated, and the most interesting piece of ecclesiastical work—Trinity Evangelical Lutheran Church, Fort Wayne, Indiana, by the Bertram Goodhue Associates, all are distinctively modern in style. Like the greater part of American Modernist work, this does not mean that in them tradition has no part; they do not seem the work of a rebel artist-illiterate; but it does mean that more and more training in past styles is being considered simply as background to the artist's mind, and not as his mode of expression.

The buildings of the Sesqui-Centennial Exposition at Philadelphia showed the same trend. This exposition was disappointing; a magnificent opportunity lost through haste and divided counsel. It had been discussed for years, and two very interesting tentative preliminary plans presented, one by Paul Cret, and one by the local chapter of the American Institute of Architects, which contemplated a board of architects like those which made the World's Fair in 1893 at Chicago, and the Panama Pacific Exposition of 1915 in San Francisco, magnificent monuments

of contemporary architecture. Both plans were unfortunately abandoned; the location was changed from the Fairmount Parkway to a flat, uninteresting expanse far south of the city, by the Navy Yard, and the general plan was prepared by John Molitor, the city architect, to whom great credit should be given for achieving even what was achieved with the limited time and money at his disposal. Mr. Molitor also designed the two great main exhibition buildings whose facades, interesting in color, but ineffective in detail and lacking central interest, flanked the main axis.

The outstanding features at the Philadelphia Exposition were Ralph Bencker's Pennsylvania Building, whose rotunda, decorated by George Harding, was one of the most effective, frankly modernistic, interiors in America, stunning in color and lighting; and the great Stadium, by Simon and Simon. The best in the foreign group was the Persian Building, whose minarets and polychromed dome reflecting themselves in the lagoon, formed perhaps the high spot of charm in the entire group. It was designed by Carl Ziegler. Noteworthy also, among the miscellaneous buildings that went to make up the somewhat incoherent group was the careful and correct reproduction of an old Philadelphia street, "High Street," done by R. B. Okie in association with Bissel, Sinkler, and Wagner. This reproduction, evidently carefully studied, *con amore*, not only has picturesque charm itself, but made real again to our machine world the beauty, the simple directness, the rightness of the eighteenth century architecture of the country.

The Trinity Evangelical Lutheran Church, Fort Wayne, Indiana, by the Bertram Goodhue Associates is the most arresting piece of work of its kind completed during the year. The exterior is in that type of modernized Gothic which was one of the late Mr. Goodhue's many valuable contributions to American architectural traditions; the interior is even more interesting in its completely free treatment of forms and materials. Its pointed arches perhaps allow it to be called Gothic; but its chancel vaulted with a pointed half dome is a new note, and the interior detail is fresh and vital. The whole has that sure, direct emotional beauty that only honesty can produce.

Interesting also is the monolithic concrete Episcopal church of St. John, at Los Angeles, by Pierpont and Walter S. Davis, the Mariemont Community Church, Mariemont, Ohio, by Louis E. Jallade, in a simple English style with an effective high slate spire over a squat square tower, and the Beverly Hills Community Presbyterian Church, by Carleton Monroe Winslow, with very free adaptations of Spanish colonial motives; more conservative design appears in the scholarly First Presbyterian Church, of Tacoma, Washington, by Cram and Ferguson, a skillful expression in brick and stone of Romanesque ideas.

Great interest was aroused towards the end of the year by the publication of the designs for the Riverside Baptist Church, New York City, by Henry C. Pelton and Allen and Collens, associated architects. This, the largest by far of recent city churches, is the successor to the Park Avenue Baptist Church. The design shown is in a monumental Gothic based upon French precedent, especially upon the Cathedral of

Mattie Edwards Hewitt

THE RIVERSIDE CHURCH

SOUTHEAST CORNER OF RIVERSIDE DRIVE AND 122ND STREET, NEW YORK CITY  
FROM THE DRAWINGS OF HENRY C. PELTON AND ALLEN & COLLENS, ASSOCIATED ARCHITECTS

Chartres, and is dominated by a huge and rather complex tower, over 300 feet high.

The year's trend in educational buildings was mainly along the traditional lines. Cram and Ferguson designed for Wellesley College at Wellesley, Mass., a Student-Alumnæ Building that is an interesting modernization of the English Jacobean style; its brick and stone forms have something of the naïveté but little of the crudity of the original style; it is typically a modern eclectic building. The schools at Mariemont, Ohio, by Feckheimer, Ihorst and McCoy, and at Kingsport, Tennessee, by Clinton Mackenzie, are both interesting adaptations of Georgian or Colonial motives to modern needs. Brescia Hall, a dormitory for the College of New Rochelle, New Rochelle, N. Y., by McGill and Hamlin, is an interesting U-shaped building around a sunken court, with a central entrance tower, all treated in a free adaptation of English Collegiate Gothic.

Among business buildings, the aim towards higher and higher buildings, to the point of menace or absurdity, continues. Detroit, in the Book Building, by L. and P. L. Kamper, contemplates 60 stories; in New York plans by the Larkin Brothers were announced for a 110-story building on West 42nd Street. This development has produced a reaction; more and more people have begun to consider the skyscraper, with its concentration of population and the burden it imposes on the traffic and all public services, a menace rather than a convenience. Public opinion is wavering.

Of the commercial buildings already completed, the Barclay-Vesey Telephone Building in New York, by McKenzie, Voorhees, and Gmelin is easily the most important. Here at last traditional design has been forgotten; masses, carefully studied, and emphasized vertical lines have been left to tell their own story and create their own beauty. The ornament, carefully localized, is fresh in design, and full of meaning; it is never allowed to obscure the structural simplicity; it is never used as a substitute for composition. The great lobby with its direct handling of materials, its bronze insets in the floor, and its ceiling painted by Mack, Jenney and Tyler, proves that as beautiful a richness of color and form can be obtained freely and non-stylistically as in any of the historical styles; it is never ostentatiously bizarre. The whole building is destined to be a monument of American progress in architecture.

The New Æolian Hall in New York, by Warren and Wetmore, which was awarded the annual medal of the Fifth Avenue Association, is entirely different; strictly traditional, it uses French ornament and lavish materials to achieve a striking superficial effect without the strength of composition or originality of the other. The Engineering Laboratories of the Ford Motor Company at Dearborn, Michigan, by Albert Kahn, reveal still another trend, a free, direct simple use of a much modified Greek precedent. This building exceedingly well composed as it is and beautiful as a façade, may be criticized by some as failing in functional expression; it could be equally well a Post Office; it more resembles a public building than a laboratory.

The tremendous and necessary development of housing throughout the country continues apparently unabated. In city work the trend is still towards large and lavish hotels and apartment

hotels, such as the Hotel Peabody, Memphis, Tennessee, by Walter W. Ahlschleger, the usual city hotel with period rooms, great lobbies and much decorative plaster, or Emory Roth's slim 30-story Ritz Tower: in New York, whose Renaissance ornament seems ill at ease on its modern form. The New Allerton House, Cleveland, Ohio, Murgatroyd and Ogden, has greater simplicity and more sure beauty; it follows the dignified Italianesque style already set in the New York Fraternities Club Building by the same architects.

Another interesting building was the apartment hotel, 28 East 63rd Street, New York, by Henry Churchill and Herbert Lippmann, a most daring and in the main successful attempt to design a building in harmony with its surroundings but at the same time radically modern. Its setback treatment is particularly interesting, and its fenestration good.

Entirely in a different class, being long and low and for communities almost rural, are three hotels in the modern Spanish Colonial style that seems the accepted vernacular of Florida and California. The Antilla Hotel, Coral Gables, Florida, Lee W. Wade, is typical; the Ritz Carlton Cloister, at Boca Raton, Florida, by Addison Mizner, is picturesquely Latin, but functional expression is lacking, and one may question seriously the propriety of making a "boom" hotel look like a church or monastery. The hotel Casa de Manaña, at La Jolla, California, by Edgar Ullrich, is simple and direct and honest; it shows that the modernization of the Spanish colonial style is possible without false picturesqueness.

Moving picture houses dominate the field of theatre design; both of the two large and important theatres most in the public gaze are by C. W. and George L. Rapp, the Oriental, at Chicago, and the Paramount in New York. Both are enormous, lavish with gilding, color, expensive marbles; both are without scale, unstudied, and have as much architectural character as those typical movie sets in the rich villain's ballroom which they so nearly resemble.

The practical completion of the residential suburb of Mariemont, Ohio, is a landmark of community planning. It was laid out through the efforts of Mrs. Mary G. Emery, represented by Charles J. Livingood; with the idea always in mind of combining the economies of group houses and group planning with an absolute lack of standardization or any institutional feeling. In compliance with this ideal, the work was distributed to many different architects, all well known in their respective fields, and the resultant charm and variety had justified the experiment. Among those whose houses deserve notice, are Carl Ziegler, Ripley and LeBoutillier, Elzner and Anderson, Robert R. McGoodwin, Richard H. Dana, Jr., Edmund B. Gilchrist, Charles W. Short, Jr., and Lois L. Howe and Manning. The farm group by Hubert E. Reeves is also worthy of notice, and the school and church already mentioned. Another housing group also important is that at Kingsport, Tennessee; especially the church, by Grosvenor Atterbury, and the Inn and Schools, by Clinton Mackenzie.

The year 1926 saw the final completion and dedication, on Armistice Day, November 11th, of the great war memorial at Kansas City, by H. Van Buren Magonigle, with a fine sculptured frieze designed by Edith Magonigle. This notable

monument, the result of one of the most important competitions since 1918, with its great shaft on its magnificent terrace, is dignified, restrained, fresh, beautiful, a worthy expression of the emotion that lay behind its construction. Also during the year, a reproduction of the famous Hancock House in Boston (built in 1737 and destroyed in 1863, and one of the finest of New England Colonial Houses) was completed at Ticonderoga, under the supervision of M. H. Westhoff, and through the generosity of John H. Sturgis, to serve as headquarters for the New York State Historical Society.

In May an attempt was made in the annual Federal public buildings bill to approve and demand in all public buildings the most deadening type of standardization. This blow at our Federal architecture was happily averted, and the standardization clause stricken from the bill, largely through the efforts of the legislative committee of the American Institute of Architects and of Senator Bruce of Maryland.

The most important competition of the year was that for the Hartford County Court House and County Building. It was won by Paul Cret, associated with Smith and Bassett, with a design Greek in inspiration, but freely treated with a simple façade of ante instead of columns. It is a dignified solution of the problem, well planned and monumental.

Among other interesting projects the great general plan made by J. C. N. Forestier for Havana, Cuba, deserves mention. It shows a carefully considered scheme for the future growth of the city, with zones set aside for specific uses, and includes many interesting and monumental points of interest, and a great national park. Parts of the Havana plan have already been adopted.

**FOREIGN COUNTRIES.** Except in England, the tendency towards a greater and greater abandonment of tradition seems to be gathering even more momentum. In England, the influence of Georgian and Gothic work is still strong, and there seems to be also a certain amount of direct influence from contemporary work in America. The Second Church of Christ Scientist in London, for instance, by Sir John Burnet and partners, designed by Thomas S. Tait, has an exterior of brick and stone which is just such a simple adaptation of Italian Romanesque as is common in American churches today, treated with the same freedom of selection. The interior, however, suddenly deserts the simple style of the exterior and becomes not only modernistic but confused.

Leith House, Gresham St., London, by Richardson and Gill, is an extremely simple treatment of a curved façade in a sort of simplified classic, depending for its effect altogether on its fenestration. Hambro's bank, London, by Niven and Wigglesworth, and the Kensington offices of the Gas Light and Coke Co. by H. Austen Hall, are both straight Georgian adaptations of considerable charm. Interesting also are the Sutton Valence School, Kent, by Adams, Holden and Pearson; very direct and simple to the point of austerity, and the Homes of Rest for Miners, Hucknall, Nottinghamshire, by Sir Reginald Blomfield. The Pearce Memorial, Thame, Oxfordshire, designed by Prof. J. Herbert Worthington, assisted by students of the Royal College of Art, London (H. J. Dow, a student, modelled the principal fountain figure) is a lovely, un-

ostentatious and inviting composition of walls, walks, pools, and gardening.

Especial notice must be given to New Ways, a house in Northampton, designed by Dr. Paul Behrens of Vienna, expressive of the most radical type of Viennese modernism, and to the continued work at Delhi, the new capital city of India, by Sir Edwin Lutyens and Sir Hobart Baker. This most ambitious scheme combining English Renaissance and Indian Mogul motives, is fast taking shape. The entire composition when completed will form one of the most striking governmental groups of the world.

**FRANCE.** In France, only one important work in the old traditional Renaissance style deserves notice, the Crédit Lyonnais at Rheims by A. Narjoux, and it seems old-fashioned. Everything else is frankly, often bizarrely, modernist, varying from the restrained and powerful Monument au Morts of the city of Lyon, by Charles Abella, architect, and Marcel Gaumont, sculptor, magnificent in scale and dramatic power, through the Stadium at Lyon, by Tony Garnier, simple, direct, but with its grand concrete arches appearing paper-thin and weak, or the proposed Hotel for Business Men in Paris by J. Ferret, shown at the Salon, with its vertical lines and setbacks, to the merely eccentric church of Ciry-Salsogne, Aisne, by Ed. Monestès.

**GERMANY.** In Germany, the swing to the left is complete and decisive. Moreover, the entire character of the work has changed; generally the last vestiges of tradition have unfortunately disappeared. The influence of such abstract French designers as Le Corbusier and Jeanneret, and of such Germans as Eric Mendelsohn is supreme. Beautiful exceptions are found; an almshouse at Rottenburg O. T., by Heinrich Söllner, has the typical German picturesqueness of high roofs. The group of buildings for the Düsseldorf Exposition, by Wilhelm Kreis, is modern and fresh, but lovely, delicate, modulated. In particular the Planetarium, the Restaurant, with a fluted domed ceiling, and the Residenz Theatre (also by Wilhelm Kreis with a daring ceiling of scales, and an effective proscenium arch, deserve commendation. Also at Düsseldorf, apartment houses by Beckner, Kutzner, and Meyer have a certain amount of authentic German beauty; balconies and porches and grouping give them interest. In Lübeck, F. W. Virck has designed a public bath of great interest, and a trades school with interesting terra cotta figures by Richard Kuehl. Mebes and Emmerich in Neu Köln have some interesting apartment house groups in brick and concrete.

For the rest, the dominance of the cube and the harsh angle is complete—curves seem forgotten. Distel and Gubitz in Hamburg have done a great office building, the Montanhof, with strange abstract figures as ornament, and many triangular bays. Eric Mendelsohn, in his Nureinburg department store, uses his usual contrasts of rather meaningless verticals and horizontals, and the "Bauhaus," at Dessau, by Walter Gropius, a great trades school group with houses attached, is entirely mechanical and harsh. Typical of the use of cubes like children's blocks is the series of group houses in Berlin by Brende Luckhardt and Alfors Anker.

In Vienna, much more of the traditional Viennese graciousness permeates the modernism. The work is principally housing, groups of tenements or apartment houses. The simplicity,

*Courtesy of N. Y. Telephone Co.*

THE BARCLAY-VESEY BUILDING  
OF THE NEW YORK TELEPHONE COMPANY  
MCKENZIE, VOORHEES & GMELIN, ARCHITECTS

directness or lack of striving for effect of these groups is remarkable. Frequently it achieves real charm. Typical are groups by Josef Frank on the Kongressplatz in Vienna, by Caesar Popovics in the Albertgasse, and by Josef Hoffmann; the latter quite classical despite its modernism.

The same tendency towards radicalism in design seems universal in Europe, appearing in different guises in different countries. In Holland, for instance, it would seem to be the influence of Frank Lloyd Wright that is supreme; everywhere the recent work shows broad overhanging cornices, exaggerated horizontal lines. Typical are the houses at the Hague, by S. Brandes. In the Scandinavian countries it is a modernism chastened and cool, and always permeated completely by a strong Renaissance tradition that keeps it from excesses of strangeness. It is sane, quiet, sure; as in the Concert Hall or the Enskilda Bank by Ivor Tengbom, both in Stockholm.

A competition held in China for a tomb for Dr. Sun Yat Sen was won by an American trained architect, Y. C. Lu of Shanghai, with a strikingly simple and monumental design in the style of North China. It is to be hoped that this indicates the birth, among the modern Chinese, of an appreciation for their magnificent architectural heritage, and the beginning of a Chinese Renaissance.

**ARGENTINA**, är'jën-tě'ná. A South American republic on the eastern coast of the southern part of the continent, consisting of 14 provinces, 10 territories and the federal district. Capital, Buenos Aires.

**AREA AND POPULATION.** The total area of Argentina is 1,153,119 square miles. According to figures supplied by the Argentinian General Bureau of Statistics, an estimate of the population of the republic as of Dec. 31, 1925, based on the census of 1914 and the birth, death, and migration records since that time, showed a total population of 10,087,118. According to the census of 1914 (the latest official count), Argentina had 7,885,237 inhabitants, while the natural increase in population by the end of 1925 was estimated at 1,818,219 inhabitants and the increase by immigration was placed at 383,652. The number of immigrants in 1925 was placed at 125,365 and the number of emigrants at 49,840. Normally immigration and emigration balance, due to the influx and exodus of large numbers of Italian and Spanish laborers before and after the harvests. The population of the larger cities were as follows: Buenos Aires, June, 1914, 1,575,813, and according to the census of June 1, 1925, 2,310,441; Rosario (Santa Fé), 1914, 222,592 (estimated December, 1923, 265,000); Córdoba, 1914, 134,935 (estimated, December, 1923, 156,000); La Plata, 1914, 90,436 (estimated, December, 1923, 151,000); Tucumán, 1914, 91,216; Santa Fé, 1914, 59,974; Mendoza, 1914, 58,790; Avellanda, 1914, 46,277; and Bahia Blanca, 1914, 44,113.

**EDUCATION.** Primary education is free, secular, and compulsory for children from 6 to 14 years of age. No later statistics on education are available than those given in the preceding YEAR BOOK, when figures for 1922 showed 9940 primary public schools, with 40,169 teachers and 1,227,400 pupils. During 1923 there were in the entire country 74 secondary, normal, and special schools under the Ministry of Public Instruction, divided as follows: 40 national second-

ary schools, one secondary school for girls, 84 normal schools, 6 commercial schools, 3 industrial schools, 15 vocational schools, 1 school of mining and chemical industries, 16 women's vocational schools, 1 institute of pedagogy, 1 institute for teachers of modern languages, 2 deaf mute schools, 1 institute for the blind, and a national academy of fine arts and a school of fine arts. The registration of pupils in these schools amounted to 73,296, of whom 31,396 were boys and 41,900 were girls; the average attendance was 64,900. Ninety-six per cent were Argentines and the rest foreigners. The teachers in these schools numbered 6366. There were also 188 private schools with 9345 pupils. In 1924 there was one national normal school for teachers in secondary schools with 76 teachers and 775 students. For higher education there are the following national universities with their latest figures for enrollment: National University of Buenos Aires, 9518; Córdoba, 1977; University of the Littoral, 2115; Tucumán, 1292 (1925); La Plata, 1464.

**PRODUCTION.** Agriculture and stock raising form the chief pursuits in Argentina. About 500,000,000 acres is estimated to be devoted to these two occupations, being about equally divided between the two. Of the cultivable portion about 10,000,000 acres require irrigation. There are about 238,000,000 acres in federal territories which are suited to stock raising, and these lands are conditionally offered free, or for sale or on lease. The area sown to wheat in 1924-25 was 17,785,235 acres and to oats, 2,645,370. Other important crops are maize and flax. Besides grain, cotton, sugar, the vine and tobacco are also cultivated. According to figures supplied by the Department of Rural Economy and Statistics, the cotton crop for 1923-26 was expected to reach 97,400 tons. The growing importance of this crop may be estimated from the fact that in 1921-22 the crop only reached 12,490 tons. The area under sugar is approximately 237,500 acres and the production of sugar in 1925 was 394,700 tons. The area under the vine is about 280,000 acres and the number of gallons of wine produced in 1925 was 143,091,872. The area under tobacco in 1924 was 22,060 acres and under cotton in 1924-25 was 261,250 acres. According to the latest livestock census there were in the republic 37,064,850 cattle; 30,671,841 sheep; and 1,436,368 hogs.

**COMMERCE.** According to the United States Bureau of Foreign and Domestic Commerce the real or commercial value of Argentina's foreign trade in 1925 amounted to 1,744,777,548 gold pesos, which was 95,327,027 pesos less than in 1924, or a decline of 5.2 per cent. The value of imports for 1925 was given at 876,847,666 gold pesos as compared with 828,709,993 for the previous year, which is an increase of 48,137,673 pesos or 5.8 per cent. The 1925 exports were given as 867,929,882 gold pesos as compared with 1,011,394,582 pesos in 1924, a decline of 143,464,700 pesos or 14.2 per cent. The unfavorable trade balance for the year, therefore, amounted to 8,917,784 gold pesos as compared with the 1924 balance of 182,684,589 gold pesos. The reduced balance of trade was due partly to the decline during the first half of the year in exports of agricultural products and meat, which were partially offset by the higher prices obtained. Increased imports contributed toward a further decline in the yearly

balance. The value of the duty-free merchandise was 27.5 per cent of the total imports, while the corresponding percentage for 1924 was 30.3 per cent.

The import duties collected in 1925 amounted to 133,089,880 gold pesos, or 15.2 per cent of the commercial value of the dutiable imports. Collections, on the other hand, represented 20.9 per cent of the value of the dutiable merchandise imported. The official or tariff evaluation of the imports for 1925, including the 60 per cent increased tariff appraisalment, was given at 663,-631,113 gold pesos, as compared with 591,835,709 in 1924. The nominal value (denoting quantity) of imports for 1925 (425,470,000 gold pesos) was the highest on record, being some 4,000,000 pesos more than the corresponding figure in 1913. The tabulation below shows, by groups, the tariff values of imports during 1925.

**TARIFF VALUES OF ARGENTINE IMPORTS**  
(In gold pesos)

Item	1925	1924
Livestock .....	688,693	585,676
Foodstuffs .....	66,530,710	48,120,473

<b>Totals .....</b>	<b>663,631,113</b>	<b>591,935,709</b>

The total value of Argentine 1925 exports was given at 867,929,882 gold pesos, or less than the 1924 total by 143,464,700 pesos. This decline was due to a decrease of 4.9 per cent in exports of livestock products and a decline of 22.3 per cent in agricultural products exported. Exports of forestal products during 1925 increased 29.7 per cent over those of the preceding year. In tonnage the 1925 exports amounted to 10,115,000 metric tons as compared with 14,400,000 tons in 1924, showing a decrease of 29.8 per cent.

**ARGENTINE EXPORTS OF PRINCIPAL PRODUCTS FROM JANUARY 1 TO DECEMBER 24, 1924 AND 1925**

Article	1924	1925

**FINANCE.** The budget for 1925 balanced at 588,641,067 paper pesos. The total Argentine

public debt on Dec. 31, 1925, amounted to 1,743,792,852 paper pesos, according to the annual message of the president to congress at the opening of the 1926 regular session on July 1. This amount compares with 1,523,-581,867 pesos at the end of 1924. (1 paper peso averaged \$0.4044 in 1925 and \$0.344 in 1924.) The total floating debt of the republic on April 30, 1926, amounted to 479,259,908 paper pesos. This figure does not include the floating debt of the State Railways, amounting to 193,012,348 pesos. The debt of the State Railways was increased 8,000,000 pesos in 1925. The floating debt of the railways includes 24,250,000 pesos owed to the national treasury, to which must be added advances made for payment of interest amounting to 9,401,605 pesos, or a total of 33,651,605 owed to the national treasury. The floating debt of the government is divided as follows:

	Paper pesos
<b>Internal:</b>	
Short-term credits .....	341,199,000
Exchange difference .....	35,000,000
Conversion fund .....	15,909,091
<b>External:</b>	
Loan of \$27,000,000 .....	63,597,272
Loan of \$10,000,000 .....	23,554,545
<b>Total .....</b>	<b>479,259,908</b>

Since the last presidential message to congress a year ago this figure shows a reduction of 194,574,946 pesos, effected largely through the application of the proceeds of two foreign loans floated in 1925. See preceding YEAR BOOK.

**COMMUNICATIONS.** The total tonnage of shipping entering Argentine ports (except Bahía Blanca) in 1924 was 2949 vessels of 10,011,-331 tons of which 1343 of 4,689,945 tons were British.

At the opening of the 1926 session of the Argentine Congress in July, President de Alvear gave a report on the operation of the Argentine railways during the past fiscal year. In this report he described railway conditions in general as satisfactory, although revenues were less in most cases than during the previous year. The total length of the Argentine railways is now 23,669 miles, of which 4350 miles are owned by the state. The number of passengers carried during the fiscal year was 140,670,000, an increase of 5 per cent over 1925. A decrease of 8½ per cent in freight traffic during the fiscal year just ended was reported. The total railway revenue amounted to \$250,695,000, a decrease of 5 per cent. Operating expenses during the year amounted to \$176,664,000 and net \$74,-031,000, a decrease of 15 per cent. The net receipts of the Argentine State Railways were \$48,676,385, while the expenses for the year amounted to \$49,063,643. The report cites a number of improvements in line with the policy of extending and modernizing both the privately owned and state owned railways and mentions as examples the construction of the new Central Argentine terminal station at Rosario; the enlargement of the Retiro station and the track elevation of most of the city lines owned by the Buenos Aires and Pacific.

**GOVERNMENT.** The executive power is vested in a president elected for six years, and the legislative power in a national congress, comprising a senate of 30 members elected for nine

years, and a chamber of deputies of 158 members elected for four years by the people at the ratio of one deputy for every 49,000 inhabitants (census of 1914). One half of the chamber retires every two years. The cabinet is appointed by and is under the direction of the president, and comprises the departments of foreign affairs, finance, interior, justice and public instruction, war, agriculture, marine, and public works. President at the beginning of 1926, Dr. Marcelo T. de Alvear (assumed office, Oct. 12, 1922); vice-president, Dr. Elpidio Gonzalez.

**HISTORY.** The year proved a fairly quiet one as far as the internal history of the country was concerned. The national legislature assembled on July 1, two months after the time set by the constitution, for which it was bitterly attacked in the press. President de Alvear in his opening message requested the members of congress to give their serious and undivided attention to the legislative tasks before them and to end the deadlock that had existed because of the activities of his political opponents. He stated that as the chief executive he was above political passion and anything he did was because he had the sole interests of the country at heart. He stressed the growing importance of the foreign affairs of the country and cited as examples the visit of the Prince of Wales and the unveiling of a statue of San Martin at Washington. He suggested that the Argentine diplomats at Mexico City and Rome be raised to the rank of Ambassadors.

The regular session of congress ended on September 30, but the president immediately called a special session to dispose of important legislation, particularly the budget for 1927, as well as the question of railway finance. The outstanding legislative act of the regular session was the complete repeal of the unpopular Workman's Pension Act of 1923, which levied a sum on all employers and employees. Both groups were opposed to it and a strike and lock-out occurred in 1924 when the first payments were due. In 1925 the law was suspended and in 1926 repealed altogether and provision made for the return of contributions.

It appeared that the controversy which had been waged with the Vatican since 1923 over the question of the appointment of an Archbishop for Buenos Aires was settled in September. As related in previous YEAR BOOKS, the Pope had refused to ratify an appointment made by the president of Argentine, whereupon for several years the president refused to make another suggestion. According to the new agreement the president was to make a nomination from three names suggested by the senate. On October 5 he nominated Fray Bottaro, who accepted the appointment, and expected to be confirmed by the Pope. Needless to say the Social Party, which favored the complete separation of state and church, was heartily disgusted with the settlement of the affair.

As the year drew to a close the usual preliminaries to a presidential election were rife. President de Alvear goes out of office in 1928, and is ineligible for reelection. The various parties were laying their plans and bringing forward their nominees for the political struggle which was almost two years off.

**ARIZONA.** POPULATION. According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 334,162. The estimated

population on July 1, 1926, was 445,000. The capital is Phoenix.

**AGRICULTURE.** The following table gives the acreage, production and value of the principal crops in 1925 and 1926:

Crop	Year	Acreage	Prod. bu.	Value
Hay	1926	181,000	647,000 *	\$9,495,000
	1925	165,000	559,000 *	8,399,000
Wheat	1926	38,000	950,000	1,235,000
	1925	32,000	736,000	1,288,000
Barley	1926	25,000	875,000	744,000
	1925	20,000	700,000	700,000
Grain sorghums	1926	35,000	1,120,000	672,000
	1925	30,000	660,000	436,000

\* tons.

**MINERAL PRODUCTION.** Arizona ranked thirteenth of the States in 1924 in respect to the total value of its mineral products. This total was \$100,325,413, in 1924, as against \$104,940,213 in 1923. Copper supplied the chief part of this total. The State's copper production was 722,653.457 pounds in 1925; in 1924, 672,365,115 pounds. Gold production was, in amount, 204,471 troy ounces in 1925 and 226,385 troy ounces in 1924; in value, \$4,226,800 in 1925 and \$4,678,800 in 1924. Silver production was, in amount, 7,371,358 troy ounces in 1925 and 6,390,684 troy ounces in 1924; in value, \$5,115,722 in 1925 and \$4,281,758 in 1924.

Lead was produced in considerable quantity in the state, and limestone, clay products and asbestos were also produced in commercial amounts.

The value of the gold, silver, copper, lead, and zinc produced by mines in Arizona in 1926 was \$111,106,000, a decrease from \$113,138,198 in 1925, according to estimates of the U. S. Bureau of Mines.

There were increases recorded, however, in gold, silver, copper, and zinc, but these increases were not sufficient to balance the decrease in lead and the general decrease in metal prices. Arizona retained its place as the leading copper producer of the United States and was first in the combined value of the five metals. The gold output increased from \$4,170,355 in 1925 to \$4,982,000 in 1926 as a result of a large increase in the production of gold ore from Union Pass in Mohave and Bisbee in Cochise County. The largest gold producers in Arizona were the United Verde, Copper Queen, Calumet and Arizona, New Cornelia, Tom Reed, Katherine, Shattuck-Denn, Magma, United Verde Extension, and Old Dominion mines. The silver output increased from 7,257,868 ounces in 1925 to about 7,479,000 ounces in 1926, but the value decreased from \$5,036,961 to \$4,667,000, as the average price of silver decreased. In recent years the output of silver from Arizona mines has gradually increased and in 1926 it exceeded that of both Idaho and Nevada. The United Verde mine was by far the largest silver producer in Arizona, but other large producers were the Calumet and Arizona, Magma, Copper Queen, United Verde Extension, Shattuck-Denn, New Cornelia, and Bunker Hill mines. The copper output increased slightly from 713,355,120 pounds in 1925 to about 715,000,000 pounds in 1926, but the value decreased from \$101,296,428 to \$98,670,000, as the average price of copper decreased. Eight copper smelting plants within the State were active throughout the year, the plant at Humboldt was blown in February 20, and considerable

ore was also treated at El Paso, Tex. The lead production in Arizona decreased from 23,876,017 pounds in 1925 to about 22,920,000 pounds in 1926, and the value from \$2,077,213 to about \$1,902,000. The output of zinc recovered from Cochise, Yavapai, and Mohave Counties increased from 7,332,116 pounds in 1925 to 12,045,000 pounds in 1926, and the value from \$557,241 to about \$885,000.

**FINANCE.** As summarized by the United States Department of Commerce, payments for maintenance and operation of the general departments of the State for the fiscal year ending June 30, 1925, were \$5,220,821, and were at the rate of \$13.02 per capita. They included \$1,789,927 for education, apportioned to the minor State divisions. The corresponding rate per capita was in 1924, \$13.56; and in 1918, \$10.02. Interest on debt totaled \$68,331 in 1925, and permanent improvements \$2,353,931. These payments, added to the expenses of the general departments brought the total of State payments to \$7,643,083. For highways were expended \$2,594,722, of which \$643,353 was for maintenance and \$1,951,369 for construction.

Revenue receipts of the State for 1925 totaled \$6,571,902. They exceeded by \$1,282,750 the payments, not including those for permanent improvements, but were less by \$1,071,181 than the total with these included. The deficiency was met from the proceeds of debt obligations. Revenue receipts were at the rate of \$16.39 per capita. Property and special taxes formed 58.1 per cent of the revenue, in 1925, as against 56.4 per cent in 1924. Their per capita rate was \$9.52 in 1925, as against \$11.30 in 1924. Earnings of the general departments and compensation for services rendered by State officials furnished 5.4 per cent of the 1925 revenue; business and non-business licenses, 15.2 per cent. These included proceeds of a sales tax on gasoline.

The net indebtedness of the State on June 30, 1925, was \$2,171,024, or \$5.41 per capita, as against \$5.85 per capita in 1924. The assessed valuation of property subject to tax was \$652,444,309. Taxes levied amounted to \$3 699,088, or \$9.22 per capita.

**TRANSPORTATION.** The total mileage of railway line Dec. 31, 1925, was 2,378.43. There were constructed in 1926 146 miles of first track and 24 miles of second track; in all 170 miles of track.

**EDUCATION.** The State was divided into four territorial sections, in each of which was held a meeting of the Educational Association. The president of the State Association had charge of the programmes carried out at the sectional meetings, and the same instructors appeared at all meetings. The proceeding was a success in calling forth the attendance of a considerably greater number of teachers than had attended under the system of a single meeting in the State.

**CHARITIES AND CORRECTIONS.** The Board of Directors of State Institutions, created in 1919, has authority over charitable and penal institutions of the State. The chief of these at the end of 1926 were the State Hospital for the Insane, at Phoenix, with about 600 inmates; Industrial School, Fort Grant, a correctional and educational institution for boys and girls from 11 to 18 years, with about 80 inmates; Pioneers' Home, Prescott, for the aged dependent, with

115; and the State Prison, Florence, with 400, including 12 women.

**POLITICAL AND OTHER EVENTS.** At the election of November 2, Gov. G. W. P. Hunt, Democrat, was reelected to serve a sixth term. He was opposed by E. S. Clark, Republican. The Democratic candidate for U. S. Senator, Carl Hayden, was elected over the Republican candidate, Sen. Ralph H. Cameron, who sought reelection. Lewis L. Douglas, Democrat, was elected to the U. S. House of Representatives to succeed Hayden. Other officers elected in 1926, to take office in 1927 were: Secretary of State, James H. Kerby; Treasurer, J. C. Callaghan; Auditor, Ana Frohmiller; Attorney-General, John W. Murphy; Superintendent of Public Instruction, C. O. Case; Judge of the Supreme Court, A. G. McAllister.

During the year Governor Hunt maintained his opposition to the interstate Colorado River Compact, writing on Feb. 10 to United States Senator Ashurst against what he contended to be the plundering of the State for the benefit of California and other neighboring commonwealths, at Arizona's expense. A contract for the construction of the Coolidge dam, a part of the San Carlos Indian reclamation project, was let to bidders in Los Angeles by the Department of the Interior, at a bid of \$2,268,525, on December 2. The dam was to be completed by Jan. 1, 1929. Situated at the entrance to Box Canyon eight miles below San Carlos, on the Gila River, it was to have a height of 250 feet, a width of 600 feet at the crest, and to impound water sufficient to irrigate about 100,000 acres near Casa Grande and Florence owned by whites and Pima Indians. An extension of the Southern Pacific Railroad through Phoenix and the Salt River valley was completed, and was opened October 15. The line, some 200 miles in length, running from the old main line at a point some 50 miles east of Yuma to join it again about forty miles east of Phoenix, had been under construction for two years.

**OFFICERS.** Governor, G. W. P. Hunt; Secretary of State, James H. Kerby; Treasurer, V. S. Wright; Auditor, Wayne Hubbs; Attorney-General, John W. Murphy; State Superintendent of Public Instruction, C. O. Case.

**JUDICIARY.** Supreme Court: Chief Justice, A. G. McAllister; Associate Justices, Henry D. Ross, Alfred C. Lockwood.

**ARIZONA, UNIVERSITY OF.** A coeducational institution of higher education at Tucson, Arizona; founded in 1885. The 1926 autumn enrollment totaled 1606, and the summer session of 1926 had a registration of 253 students. The number of members on the faculty in the autumn of 1926 was 144. The University receives Federal and State support. The endowment fund amounted to \$10,000. The total income for the year 1925-26 was \$1,517,632. The new library, completed at an approximate cost of \$450,000, was first used in September, 1925. It contains 75,000 volumes. A new gymnasium for men, costing approximately \$175,000, was completed in September, 1926. President, Cloyd H. Marvin, Ph.D., LL.D.

**ARKANSAS. POPULATION.** According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 1,752,204. The estimated population on July 1, 1926, was 1,903,000. The capital is Little Rock.

**AGRICULTURE.** The following table gives the

acreage, production and value of the principal crops in 1925 and 1926:

Crop	Year	Acreage	Prod bu.	Value
Corn	1926	2,026,000	41,533,000	\$33,226,000
	1925	2,006,000	28,084,000	27,241,000
Wheat	1926	30,000	405,000	518,000
	1925	30,000	390,000	585,000
Cotton	1926	3,782,000	1,620,000 <sup>a</sup>	89,100,000
	1925	3,738,000	1,600,000 <sup>a</sup>	128,770,000
Rice	1926	189,000	10,017,000	10,017,000
	1925	175,000	7,525,000	11,288,000
Hay	1926	722,000	814,000 <sup>b</sup>	12,564,000
	1925	709,000	553,000 <sup>b</sup>	9,580,000
Oats	1926	243,000	5,346,000	2,780,000
	1925	261,000	4,176,000	2,422,000
Potatoes	1926	32,000	1,920,000	3,520,000
	1925	28,000	1,680,000	3,528,000
Sweet potatoes	1926	39,000	4,212,000	4,001,000
	1925	36,000	3,060,000	3,825,000
Sorghum sirup	1926	38,000	2,926,000 <sup>c</sup>	2,487,000
	1925	38,000	2,584,000 <sup>c</sup>	2,403,000

<sup>a</sup> bales, <sup>b</sup> tons, <sup>c</sup> gals.

MINERAL PRODUCTION. Petroleum, the State's leading mineral product, rose in 1925 to a production of 74,749,000 barrels, as against 46,028,000 barrels in 1924. The total in 1925 was valued at \$70,000,000; in 1924 at \$43,130,000. The coal production for 1925 was 1,220,039 net tons. That in 1924 was 1,451,503 short tons. Coal production for 1925 was valued at \$4,829,000; that for 1924 at \$5,898,000. The natural gas output in 1924, the latest year available, was 36,616,000,000 cubic feet, valued at \$4,908,000. Its total production in 1923 was 24,215,000,000 cubic feet, valued at \$3,255,000. Gasoline from natural gas was produced in 1925 to the quantity of 19,000,000 gallons, and in 1924 of 17,533,000 gallons; and to the value in 1925 of \$2,050,000, and in 1924 of \$1,784,000. The State continued in 1925 to produce the greater part of the domestic bauxite, the year's production being in 1925 296,320 long tons and in 1924 327,630 long tons; the value in 1925, \$1,878,450, and in 1924 \$1,981,000. The total value of the mineral production of the State in 1924 was \$61,748,999; in 1923, \$41,954,319.

FINANCE. As summarized by the United States Department of Commerce, payments for the maintenance and operation of the general departments of the State for the fiscal year ending June 30, 1925, were \$11,238,257, and were at the rate of \$6.10 per capita. They included \$3,731,923 for education, apportioned to minor State divisions. The rate per capita for maintenance and operation of the general departments was in 1924, \$4.68, and in 1918, \$2.46. Greater apportionments for schools largely made up the 1925 increase. Interest on debt totaled \$128,597, and permanent improvements \$8,417,793. Total payments for general department expenses, interest and outlays were \$19,784,647. For highways was expended \$9,560,551, of which \$1,511,816 was for maintenance and \$8,048,735 for construction, occasioning a large increase for outlays in 1925.

Revenue receipts of the State for 1925 totaled \$17,740,073, and were at the rate of \$9.62 per capita. They exceeded by \$6,373,219 the payments excepting for permanent improvements, and were \$2,044,574 less than the total with these included. Payments in excess of revenue receipts were met from proceeds of debt obligations. Property and special taxes formed 38.8

per cent of the revenue in 1925, as against 48.1 per cent in 1924 and 75.4 per cent in 1918; their per capita rate was \$3.73 in 1925, \$3.43 in 1924 and \$2.13 in 1918. Earnings of the general departments and compensation for services rendered by State officials furnished 6.9 per cent of the 1925 revenue; business and non-business licenses, 40.6 per cent. These included corporation taxes and sales taxes on gasoline, cigars and cigarettes.

The net indebtedness of the State on June 30, 1925, was \$2,443,275, or \$1.33 per capita, as against \$1.36 per capita in 1924. The assessed valuation of property subject to tax was \$599,776,921. Taxes levied amounted to \$5,218,059, or \$2.83 per capita.

TRANSPORTATION. The total mileage of railway line at the end of 1925 was 4901.24. Virtually the only new construction in 1926 was 5 miles of second track. Ten miles of line of the Cache Valley Railroad from Sedgwick to Light were abandoned and taken up.

EDUCATION. An important aid to educational expansion in the lower schools was supplied by the adoption during the year of a measure increasing by 50 per cent the limit constitutionally allowed to local districts for taxation for school purposes. This measure, known as constitutional amendment Number 13, raises the maximum tax rate permitted to the local districts from the old figure of 12 mills to that of 18 mills on the dollar. For the school year 1925-1926 the school population was 626,730, including colored, 156,213. The enrollment of pupils was 495,236; of this number the white enrollment was 351,063, 191,471 being male and 189,592 female; and colored enrollment was 114,170. In elementary schools enrollment was 463,197; in high schools, 32,039. Expenditures for public elementary and secondary schools totaled \$12,194,868. For State institutions of higher learning was expended \$2,546,647.

CHARITIES AND CORRECTIONS. A State Board of Charities and Corrections, formed June 10, 1925, has charge of the State's charitable, penal and correctional institutions. It is composed of three members. The following were the institutions under its charge, with their populations, at the end of 1926: State Hospital for Nervous Diseases, 2500; State Penitentiary, 1350; Boys' Industrial School, 300; Girls' Industrial School, 100; State Farm for Women, 36; Arkansas School for the Blind, 303; Arkansas School for the Deaf, 350; Negro Boys' Industrial School, 100; Confederate Home, 200.

POLITICAL AND OTHER EVENTS. At the election of November 2 Senator Thaddeus H. Caraway, Democrat, was reelected, for the six year term in the United States Senate beginning March 4, 1927. From the State were elected to the United States House of Representatives a solid delegation of seven Democrats, these all being Representatives already in the House. John L. Martineau opposed Governor Terral for the Democratic nomination as a candidate for governor, and won in the State primaries on August 10, in spite of opposition from supporters of prohibition. He was elected governor, with the entire Democratic ticket, at the State election. The election of 1926 produced in the 1st of State officers and judiciary the following other changes: for Treasurer, Ralph Koonce; Commissioner of State Lands, Highways and Improve-

ments, J. P. Womack; Supreme Court Justices, William F. Kirby and James W. Mehaffy. Mr. Mehaffy died shortly afterward, and his place was to be filled by appointment.

Litigation before Chancellor George M. Le-croy, between former partners in the purchase of road improvement district bonds, brought forth in November allegations of corrupt practices in road financing, involving officials in twelve counties. Members of the Legislature announced the intention to ask an investigation when the General Assembly should convene in 1927. A severe tornado did extensive damage in Cleburne, Conway and Jefferson Counties on November 25, and took 29 lives. Arkansas business interests occupied themselves during the year with efforts to bring more cotton mills into the State. Manufacturing districts of the East were canvassed by a traveling party of 100 in November. Arrangements were reported December 9 for the removal of a New Jersey tire fabric mill to Morrillton, there to erect a mill of 40 looms and 10,000 spindles. The Cotton Growers' Coöperative Association for the purpose of pooling and carrying excess cotton of the State's 1926 crop was formed December 2 at Little Rock. It was to work independently of the ordinary cotton pools sponsored by the State Cotton Growers' Association, which were to operate as usual, and it formed one of the series of emergency pool organizations created throughout the cotton belt after the general plan presented by the Federal authorities.

OFFICERS. Governor, Thomas J. Terral; Secretary of State, J. B. Higgins; State Treasurer, D. M. Blackwood; Auditor, J. C. Cone; Attorney-General, W. M. Applegate; Commissioner of State Land, Highways, and Improvements, Herbert R. Wilson; Commissioner of Mines, Manufactures, and Agriculture, William N. Wilkes; Superintendent of Public Instruction, A. B. Hill; Adjutant-General, Heber L. McAllister.

JUDICIARY. Supreme Court: Chief Justice, E. A. McCulloch; Associate Justices, Carroll D. Wood; Jesse C. Hart; Frank G. Smith; T. H. Humphreys.

**ARKANSAS, UNIVERSITY OF.** A coeducational State institution at Fayetteville, Ark.; founded in 1871; comprising colleges of arts and sciences, education, engineering, agriculture (including an experiment station), and schools of law, business administration, and medicine, the last named being at Little Rock. In the autumn of 1926 the enrollment was about 2000, and for the summer school of 1926, 810. The number of faculty members, including administrative officers, was 180 in the autumn of 1926. The number of volumes in the library was 68,000. The productive funds amounted to \$132,000, and the income for the year 1926-27 was approximately \$1,100,000. The State legislature of 1925 appropriated \$650,000 for new buildings, which were under construction in 1926 and were expected to be completed about June, 1927. President, John Clinton Futrell, M.A., LL.D.

**ARMAMENT, LIMITATION.** Cf. See DISARMAMENT.

**ARMENIA.** A term applied since April 2, 1921, to the new state known as the Socialist Soviet Republic of Armenia, or the Republic of Erivan. Before the World War, Armenia sometimes indicated the Armenian territories

of the former Turkish Empire and sometimes the entire region in which the dominant race element was Armenian. In the former Turkish Empire the Armenians constituted about 38.9 per cent of the population in the following vilayets: Erzerum, Bitlis, Kharput, Diarbekir, Sivas, and Van; being in the minority in the first five and a majority in the last-named. The present number of Armenians in the Turkish Republic is unknown, a large part of the Armenian element having disappeared from Anatolia during the War and afterwards as a result of massacres, deportations, and migrations. The population of the former Turkish Empire known as Armenia and Kurdistan was given at 2,470,900.

**SOCIALIST SOVIET REPUBLIC OF ARMENIA.** This republic comprises the southeast frontier region of Transcaucasia which formerly belonged to the Russian Empire, but which in November, 1919, split off from Bolshevik Russia. The whole Transcaucasian region comprised the three main peoples, Armenians, Georgians, and Tartars, and was at first constituted into a federal republic which lasted only a few weeks, when it was dissolved into three component parts, the Armenian Republic, Georgia, and Azerbaijan, each of which declared its independence. The *de facto* independence of the Armenian Republic was declared on May 26, 1918, and was recognized by the Allies in January, 1920. Shortly afterwards it fell entirely under the influence of the Russian Soviet, and was proclaimed a Soviet republic on April 2, 1921. It later joined the new Russian federated state. The area is 15,240 square miles and the population, 1,214,391. The capital, Erivan, has a population of about 90,000. In 1923 the state maintained 577 schools and in 1924, 2344.

Agriculture engages the great proportion of the population, wheat, rice, licorice root, tobacco, cotton, and wine being the leading products. The area sown in 1924 was 249,000 dessiatines, which represents about 90 per cent of the area under cultivation before the World War. The cultivation of cotton, which fell away to almost nothing after the Bolshevik Revolution, is gradually assuming its place of importance in the agricultural activities, 16,000 dessiatines being devoted to its culture in 1924. The mining of copper is also becoming a leading industry again, 1500 persons being engaged in this activity. In 1923 there were 1,405,000 head of cattle in the republic. In the following year the value of the output of state manufacturing enterprises was 876,000 rubles. Actually, having no seaports, the country is almost cut off from the outside world, being compelled to depend for its communications on the single Transcaucasian Railway which passes through its territory on the way from Batum to Baku. In the summer of 1921, Baku was declared a free port.

**ARMIES.** See MILITARY PROGRESS.

**ARSENIC.** In 1925 the white arsenic (refined and unrefined) produced in the United States amounted to 12,317 short tons, valued at \$1,193,039, as compared with 14,453 tons, valued at \$2,655,015 in 1924. In 1925 arsenic compounds imported for consumption in the United States were as follows: Arsenic or arsenious acid, 9316 short tons, valued at \$1,076,073; arsenic sulphide (realgar and orpiment), 476 short tons, valued at \$63,296; sheep dip to the amount of

73,477 pounds, valued at \$4953; and Paris green and London purple amounting to 2880 pounds, valued at \$702. There were also 59,112 pounds of "acid," valued at \$2676; 149,018 pounds of "metallic arsenic," \$31,918; 10,467 pounds of "lead arsenate," \$1514; and 1074 pounds of "calcium arsenate," \$135.

In 1926 the United States production of arsenic was estimated at about 5700 tons and the imports at 7600. The consumption for the calendar year was slightly over 21,000 tons, the estimated stock at the beginning of the year being about 9800 tons and at the end of the year 4400. The price fell during the year to three cents a pound or lower, there having been a gradual decline from early in 1924. The imports in 1926 came very largely from Canada and Mexico and consisted of by-product arsenic, while Japan, Germany, Belgium, and Greece, which previously were large exporters to the United States when prices were high, were practically missing on the list of imports.

**ART EXHIBITIONS.** An interesting feature developed in the public display of paintings during the year 1926 was that of "Loan Exhibitions," which were held increasingly in museums and in the well-appointed galleries of dealers. The paintings were obtained from the great private collections, through the kindness and generosity of their owners. Exhibitions of rare antiques, potteries, sculpture, glasses, oriental rugs, tapestries, textiles and embroideries increased in number, showing a growing knowledge and the deeper interest taken in these artistic developments of past ages. Memorial exhibitions were held of the works of Ben Foster; J. Stewart Barney; Mary Cassatt; Claude Monet; John Quinn; and John Singer Sargent; the latter consisting of 60 paintings and as many water colors, was held in the Metropolitan Museum of Art.

Interesting "one-man" displays were those of Foujita, a Japanese artist from Paris; Marc Chagall and Alexander Archipenko, Russian artists; a first comprehensive display of sculpture of Aristide Maillol; the sculpture of Brancusi; of Maurice Sterne, both sculpture and painting; Eugene Speidaer; Leon Kroll; George Luks; and the sculpture of Robert Laurent. Numerous group exhibitions were held in galleries of semi-public character, such as: the Whitney Studio Club; the Société Anonyme; the Civic Club of New York; the Art Club of Chicago. The annual exhibitions of summer art colonies and the various art societies were held as usual.

Among the latter should be especially mentioned the New Society; the Allied Artists of America; the New York Water Color Society; the National Association of Women Painters and Sculptors; the Salons of America; the Tri-National Exhibition, held for the first time this year in New York City and important European centres; the Independent Society, the largest no-jury exhibition held in America, with several thousand exhibitors from all over the country; and the other no-jury exhibitions held in Buffalo, Chicago and Boston.

The Corcoran Gallery of Art, Washington, held this year its Tenth Biennial Exhibition of Contemporary American Oil Paintings. The prizes for this exhibition were donated by the late Sen. William A. Clark and are always much sought after. The group of artists who

served this year as a jury of selection and award were: Edmund C. Tarbell, John C. Johansen, Jonas Lie, Leopold Seyffert and Robert Spencer. The first prize of \$2000, and gold medal was awarded to Charles A. Hawthorne for his "The Fish and the Man," a characteristic work, solid and impressive; W. Elmer Schofield won the second prize of \$1500 and silver medal with his "Little Harbor," a successful presentation of land and water, skillfully composed and full of light and sunshine; A nude, by Adolph Borie, softly and charmingly portrayed, was the recipient of the third prize of \$1000 and a bronze medal and the 4th prize of \$500 went to Abram Poole for a group portrait painting entitled "Spanish Sisters." The exhibition is perhaps the most representative one of present-day American paintings held in the United States and the calibre of the work hung is pre-eminently high.

Among the interesting exhibitions of old masters held in various New York galleries were: two exhibitions of early Venetians of superb quality; a group of Fragonards, the first seen in a long time in America; the first exhibition of the work of Chardin ever seen in America, remarkably fine; a group of drawings by old masters; and a beautiful exhibition of paintings "Childhood in Art." Other interesting exhibitions were: the Arthur Davies Collection of modern French masters; the two loan collections of 18th century French masters, and of Dutch, Flemish, and Italian masters held in the Detroit Art Institute; the Lea Collection of Old Masters at the Pennsylvania Academy; an exhibition of paintings, old and modern masters, forming the collection of the late John D. McIlhenny, former president of the Pennsylvania Academy; an immense exhibition in the Brooklyn Institute Museum of modern European painting; and a fine collection of early American portraits at the Century Association, New York City. In the Metropolitan Museum was shown a selection of modern decorative art objects from the International Exposition in Paris. The International Society of Etchers held their annual exhibition in the Brooklyn Institute Museum; the International Water-Color Exhibition was held in Chicago.

**EUROPEAN EXHIBITIONS.** Art exhibitions of note in Europe included: in Paris the Salon d'Automne with 4000 exhibits, and the Society of Independents, with 200 exhibits. An important retrospective exhibition of Flemish landscape painting of the 16th, 17th, and 18th centuries, was held in Brussels; the first comprehensive exhibition of the work of Zuloaga ever held in Spain, celebrated the opening of a palatial Fine Arts Building in Madrid; an exhibition of modern Dutch painting was held in the Jeu de Paume, Paris. In London occurred the installation of the new wing of the Tate Gallery, donated by Sir Joseph Duveen, and opened personally by King George. Important examples of modern art, particularly those of representative French masters, purchased through the Courtauld Fund were on display. The Scottish Royal Academy celebrated its centenary, and the Royal Academy opened with an exhibition of over 600 paintings, of which the majority were portrait compositions. During the year a superb collection of Claude Lorraine drawings were shown at the British Museum. In Toronto, Canada, a new Art Gallery

was opened with a fine exhibition of old and modern paintings loaned from the collections of museums and art dealers in the United States, and from the National Museum and private collections in Canada.

**PENNSYLVANIA ACADEMY.** The 121st exhibition of the Pennsylvania Academy of Fine Arts opened with an excellent display, unusually well-hung, and with the sculptural sections more noteworthy and interesting than perhaps ever before. In 1925 the great preponderance of paintings were landscape, in 1926 figure and portrait pieces were most in evidence. The coveted Temple Gold medal, awarded to the best painting in the exhibition, went to Hayley Lever for "The Harbor," a Gloucester scene, full of color and sparkle. "Narcissus," a delightful figure study by Adolph Weinman, received the Widener medal for the best sculpture. The Sesnan Prize for the best landscape was awarded to Charles Rosen for his "Group of Houses," a well-constructed problem in angles and uprights. Other prize winners were: Robert Vonnoh, the Lippincott Prize, for "Leah" a figure study; Alice Kent Stoddard, the Beck gold medal, for a portrait "Miss S.," very agreeable in color and composition; and Miss Wenonah Bell, the Mary Smith Prize, for the best painting by a Philadelphia woman, for her charming "Still-Life." "The Sledding Party," by Carl Lawless, was sold on the opening day. Robert Henri, Leopold Seyffert, Ernest Epstein, Richard S. Meryman, and Robert Susan contributed interesting portraits. In the big Gallery F., landscapes by Robert Spencer, Edward Redfield, Gifford Beal, Morris Hall Panoast, Joseph Pearson, and Walter Ufer presented a brave array. The bronze bust of John F. Braun, the latest work by Charles Grafty, splendidly modeled and characterized, was one of the finest efforts in the exhibition. Other sculptors represented were Alfred Lessle, Frederick Roth, John L. Clarke, Walter Hancock, C. P. Jennewein, Edmond Quinn, and Benjamin T. Kurtz, a new comer, who exhibited several African subjects.

**ARCHITECTURAL LEAGUE.** The 41st annual exhibition of the Architectural League of New York took place in the Fine Arts building with a display of more than 1000 listed objects. The big Vanderbilt Gallery contained the main exhibits in mural painting, and sculpture. The development of the American skyscraper was shown in models and drawings of every conceivable kind. The plans for the Arlington Memorial bridge by McKim, Mead and White formed an interesting exhibit; as also a series of elaborate drawings for the restoration of King Solomon's Temple, executed by Helmle and Corbett for Dr. John Kelchner. Two special medals, the Henry O. Avery Prize for sculpture, and the Michael Friedsam medal for unusual achievement in the encouragement of art in industry, were awarded to Benjamin Kurtz for his exhibit "Duck," and Harry Wearne, president of the Art-in-Trades Club, for his influence in promoting good design in industrial art. The medal in sculpture was awarded to Charles Keck for his Montclair, N. J., war memorial, a heroic figure, "Victory." The firm of John Mead Howells and Raymond M. Hood, of New York City, received the medal for architecture for the design of the Chicago Tribune Building, a model of which was among the exhibits. The award for conspicuous achievement in mural painting went to George Davidson for his panel "Commerce."

Miss Sarah Cooper Hewitt, and, posthumously, her sister, Miss Eleanor Gurnee Hewitt, were awarded the President's medal, designed by Daniel Chester French, for their services in the upbuilding of the Cooper Institute and its Museum.

**NATIONAL ACADEMY, SPRING.** The 101st annual exhibition of the National Academy presented its usual appearance of a well-chosen, seriously-painted array of, for the most part, paintings with an academic trend. The number of prizes given, eighteen in all, was the largest in its history. Childe Hassam, N.A., was awarded for the second successive year the first Altman prize for the best landscape painting. The picture entitled "The Flight into Egypt," represented Mr. Hassam's flight into the realm of religious painting, and displayed his well-known mastery of color and design in the impressionistic technique. "Southegan Hills," a breezy, well-constructed landscape by Roy Brown, carried off the second Altman prize. The first and second Altman figure prizes were awarded to: Carl Anderson for a portrait study, delicate and refined in handling; Walter Ufer of Taos for a typical New Mexico subject shining in the brightest and crispest sunlight, entitled "Luncheon at Lone Locust." A delightful figure composition "The Pink Kimono," by J. W. Schlaikja, received the first Hallgarten prize. The second and third Hallgarten prizes went to: J. H. Connaway for "The Giant"; and Carl W. Peters for "From a Window," a pleasing rendition of an interior and exterior effect. A landscape, "Grey Day," tonal in character, earned for Antonio Martino the J. Francis Murphy memorial prize; "Passing By," by Martin Hennings, received the Isidor gold medal. An interesting canvas entitled "At Work," in subdued grays and blacks by Kyohel Inukai, a Japanese artist, was awarded the Maynard portrait prize; the Thomas B. Clarke prize was won by Will Foster for his indoor figure composition entitled "In the Music-Room." The Carnegie prize for the most meritorious landscape in the exhibition went to W. Granville Smith, N.A., for "South Haven Mill," a freshly-colored and competently executed canvass. Charles Hawthorne received the Proctor portrait prize for "The First Mate," a rendition already familiar to the exhibition galleries; to Miss Hilda Belcher went the Julia A. Shaw memorial prize for "Scarlet and Blue," a figure composition, sensitively handled. The sculpture exhibit was small and not particularly noteworthy. "Portrait" by Cesare Stea was awarded the Helen Foster Barnett Prize; and "Rising Sea Mists," a symbolical figure, by Chester Beach, N.A., received the Elizabeth Watrous gold medal. The Saltus medal and the Ellin P. Speyer memorial prize were given to the brothers, Attilio and Horatio Piccirilli, for compositions called "Un Sogno di Primavera," and "Black Eagle."

**NATIONAL ACADEMY, WINTER.** This exhibition omitted in 1925 because of the Centennial Exhibition, was again resumed, but without any undue excitement in the way of new and stimulating exhibits. On the contrary, the display on the whole, smaller than usual, attractively and carefully hung, with several striking canvases in the big Vanderbilt Room, presented nevertheless a somewhat lifeless and inert appearance. The prize winners were all familiar names and their work lacked further development. A large

canvas, "The Hills of Barrington," by Chauncey F. Ryder, possessed the impetus and freshness of the wide out-of-doors, which was stimulating to the beholder. A careful still life by Frank Benson, and a rather heavy bit, "The Fish, the Bottle and the Boy," by Charles Hawthorne, were noteworthy. Figure and portrait compositions predominated, but none was of any outstanding importance.

The sculpture exhibit was small and inconspicuous. The prizes in sculpture were awarded to: Karl H. Gruppe, the Helen Foster Barnett prize for "La Joie"; Evelyn B. Longman, the Julia Shaw Memorial prize for a careful bronze portrait of Ivan Olinsky, N.A.; and Hilda Kristina Gustafson-Lascari, the Elizabeth Watrous gold medal for a rather timidly executed female figure entitled "The Awakening."

The two Altman prizes, the most sought-after awards in the Academy shows, were awarded to Wayman Adams, N.A., for his "108 West 57th Street," a figure composition of the art dealers, the brothers Milch; and Oscar E. Berninghaus, A.N.A., for "A Hunter of Taos," a decorative effort with an Indian in a conventional pose. Walter Ufer, N.A., also of Taos, received the laidor medal for "The Discussion," a canvas rendered in his familiar, clean cut and decisive manner. John F. Folinsbee, A.N.A., won the J. Francis Murphy Memorial Prize with a landscape "Bourre," a French scene pleasingly rendered; and Henry Rittenberg, A.N.A., received the Thomas R. Proctor Prize for a portrait of Miss Marjorie Jay Daingerfield.

CARNEGIE INSTITUTE, PITTSBURGH. The twenty-fifth international exhibition opened with 372 paintings, of which 266 were from Europe and 106 from America. France, Italy and Great Britain were the largest contributors from abroad. Giovanni Romagnoli, one of the most distinguished painters of Italy today, was awarded the honor and distinction this year of a one-man show. A jury of six artists, composed of Pierre Bonnard, well-known French painter, Giovanni Romagnoli, mentioned above, Charles Sims, British portrait painter, Charles W. Hawthorne, Howard Giles and Gifford Beal, well-known American artists, together with Homer St. Gaudens, Director of Fine Arts at the Carnegie Institute, awarded the prizes. A group of the European paintings was afterwards shown in other cities. This exhibition is the only yearly international one in the world, and a special effort was made this year to have not only the different nations exhibit, but also to obtain a clear idea of the various tendencies displayed in the present artistic development of each nation.

The first prize (\$1500), was awarded to Ferruccio Ferrazzi, a young Italian painter, for an interior with two figures, a mother and child, entitled "Iloratia and Fabiola." The composition was an unusual one, the mother, a curiously elongated figure, was depicted leading the child vivaciously from one room into the adjoining one, the whole presenting a naïve and pleasing impression. K. X. Roussel, the veteran and well-known French painter, was awarded the second prize (\$1000) for a characteristic landscape with faun and nymph, rich and glowing with color. The third prize was awarded to Robert Spencer, American painter, and member of the National Academy, the canvas entitled "Mountebanks and Thieves" representing one of his fa-

vorite subjects, a group of houses with various people in interesting movement in the foreground. The Honorable Mentions, the first of which carried a prize of \$300, went to Max Kuehne and John Carroll, Americans; Dod Proctor (Mrs. Ernest Proctor), British; and Antoine Faistauer, an Austrian. The special prize of \$500, offered for the second time this year, by the Garden Club of Allegheny County was awarded to Walter Sickert, the English artist.

ART INSTITUTE, CHICAGO. The 39th annual Exhibition of American Paintings and Sculpture opened with 219 paintings and 62 pieces of sculpture, figure paintings and portraits predominating. The increase in ambitious portrait paintings was due probably to the Logan Prize of \$1000 for the best portrait, awarded for the second time this year, and won by Charles Hopkinson for his "Family Group," a portrait of himself, his wife and five attractive daughters. The Logan medal and prize of \$1500, was awarded to George Luks for a spirited rendition of a young man playing the accordion, his mouth wide open as if to sing. The Potter Palmer gold medal was awarded to Eugene Speicher for his ambitious nude exhibited in his one-man exhibition in New York last year. Benjamin Kurtz, a new comer, received the Keith Spalding Prize of \$1000 for the best sculpture executed in the last five years, a boldly executed "Mask of a Nubian Girl." The French Memorial gold medal for a piece of sculpture or a painting by a student or former student of the Art Institute, was awarded to John Davis Brein for his bas-relief "Romanza." Other prize winners were: Clifford Addams, a portrait study of a young girl in black entitled "Bohemienne," the Norman Waite Harris silver medal and prize of \$500; John W. Norton, the second Norman Waite Harris medal and prize, for a painting of a half-length reclining nude figure of a young girl; Elizabeth Sparhawk Jones, the M. V. Kohlstaam Prize for her interesting painting, "The Resting Wood-Cutters"; James Copping, the Martin B. Cahn Prize for the best oil painting by a Chicago artist, a rural landscape, "The Old Barn"; Charence R. John, the Augustus Peabody prize, for an enterprising landscape entitled, "Lumberville, Buck County, Pa." Honorable mention was awarded to Carl Wuerner, Kenneth Bates, Ivan Albright and Robert K. Ryland. The paintings were beautifully hung and the various galleries presented a most ingratiating appearance. The opening day had its accustomed number of admiring throngs.

ART INSTITUTE, CHICAGO. See ART EXHIBITIONS.

ART MUSEUMS. New museums with generous endowment funds continued to increase with amazing rapidity in the United States. Almost every city of any size in the South, East, West or North, was able to boast a museum, with constantly growing collections. A new wing was completed and opened to the public by the Metropolitan Museum of Art in New York City. This new wing "K," contains collections of Greek and Roman art objects, beautifully arranged, and a Roman court with garden, decorated with sculpture, with painted Pompeian red walls, green plants and a central fountain. Acquisitions to the various collections of

the Museum included: the Henry G. Keasebey Collection of arms and armor; a fine basalt statue to the Egyptian department; a large Chinese bronze statue of the Wei dynasty; the St. Gaudens mantel from the Cornelius Vanderbilt residence; a small self-portrait by Gilbert Stuart; a rare example of early Flemish painting, a "Pieta," by the "Master of the Virgin among the Virgins"; a portrait by Adrian Brouwer, Flemish master of the 17th century. The department of furniture and decorative arts was enriched by a fine Renaissance armoire, dated 1553. A miniature portrait by Hans Holbein of Thomas Wriothesley, first Earl of Southampton, was an important purchase. A number of objects of decorative art were added to the various departments, as also some interesting additions to the Print Department.

Gifts and purchases announced by the Detroit Institute of Fine Arts included a small circular portrait of very fine quality by Hans Holbein; an early Flemish landscape by the unknown "Master of the Lucia Legend"; a beautiful "Crucifixion" by Barent van Orley; a "Mystic Marriage of St. Catherine" by Correggio, a gift; a landscape by Jacob Ruysdael; a canvas by the late Max Bohm, American painter; and a collection of Romanesque art, comprising a sarcophagus, and a number of architectural fragments. To the collections of the St. Louis Museum were added: the Ellis Wainwright Collection of bronzes and paintings, with examples of the Barbizon school and sculptures by Barye; 118 pieces of porcelains from the Alfred D. Pell Collection, both bequests. The Boston Museum of Fine Arts acquired by purchase, an unusual "St. Jerome" attributed to Carpaccio and an "Adoration of the Magi" by Tintoretto. The Rhode Island School of Design Museum purchased a beautiful "Aphrodite," Greek, 2nd century; and the Cleveland Museum obtained by purchase, a Cranach print, and by gift, a "Holy Family" by El Greco. The National Gallery, Washington, had its collection enriched by the addition of quite a number of fine early American portraits to be known as the "George Buchanan Coale Collection." The Pennsylvania Museum acquired by purchase a superb tapestry of early Flemish Renaissance and also an interesting Gothic tapestry, a gift. The Art Institute of Chicago announced the bequest of 22 paintings—Dutch, Flemish and Barbizon masters, from the estate of the late Charles L. Hutcheson, former president of the Institute. A group of modern American and French paintings was added to the permanent collection of the Brooklyn Institute Museum, also "The Awakening," a heroic bronze by Maurice Sterne; and a completely equipped Swiss Gothic interior, dated 1517, discovered recently in the Engadine. All these acquisitions were gifts. A new Museum was opened in Providence, Rhode Island, and a new wing added to the Cincinnati Museum, the gift of Mrs. Mary M. Emery, to house the collection already donated by her. The Minneapolis Institute of Fine Arts purchased a striking sculpture "Crouching Lion," Greek B.C. 380; and announced the addition of a new wing, provided for by popular subscription.

An Art Museum was provided for Yale University by an anonymous gift of one million dollars. The Yale School of Fine Arts also announced an appropriation of \$150,000 from

the Carnegie Corporation for the founding of a professorship in the history of art. Other gifts were: the Gutenberg Bible, Melk edition, a gift of Mrs. Edward S. Harkness; the famous group of English Chinoiserie tapestries, once the property of Elihu Yale, the founder of the University, the gift of Mr. Edward S. Harkness; and mural paintings, marbles, and other objects of art from the Huntington residence, the gift of Mr. A. M. Huntington.

A number of fine 18th century masters was added to the collection of the Carnegie Art Institute, Pittsburgh, together with 130 line engravings by Charles Mellan, 18th century, both gifts. The Wallace Nutting Collection of early New England furniture was presented to the Wadsworth Athenaeum, Hartford, Conn., by J. P. Morgan. Others of the smaller museums which added substantially to their collections were: Denver, Colorado; Newark, New Jersey; San Diego, California; Dallas, Texas; and Toledo, Ohio. The last named, through the perpetual endowment fund established by the will of Mrs. W. E. Libbey, became one of the most heavily endowed museums in America.

**ART SALES.** The outstanding event of the year was undoubtedly the sale of the collection of the late Lord Leverhulme, which took place early in the year in New York. The dispersal of this colossal collection required a series of seven distinct and separate catalogues and nineteen auction sessions. The furniture, tapestries, rugs, bronzes, etc., required alone nine sessions. The furniture, principally 18th century English, was the most comprehensive and beautiful ever before viewed in America. Other sections were composed of porcelains, English and Chinese, original drawings and prints, water colors, rare books, and paintings, the latter principally 19th century English, including fine examples of the Pre-Raphaelite masters.

Second in importance and especially in the spectacular prices which were obtained, was the sale of the famous Michelham Collection of 18th century English paintings, furniture, porcelains, tapestries and objects of art, dispersed at auction in London. The paintings were of foremost calibre and brought correspondingly high prices. "Pinkie" by Thomas Lawrence, a beautiful full length portrait of a young girl posed against a summer sky was obtained by a New York dealer for an American collector at the record breaking price of \$377,000, the highest sum ever paid for a painting at auction. "Master Heathcote" by Thomas Gainsborough was secured by the same dealer, and the beautiful full length "Portrait of Lady de la Pole," by George Romney, was acquired for the collection of Governor Fuller of Massachusetts, who also bought the "Caller Herring Girl" by Millais, an outstanding picture of the Leverhulme Sale. Other important sales in the United States were: the A. G. Huntington Collection of English color prints and engravings; the Huntington collection of paintings with examples from Dutch, South German, early Flemish, Barbizon and modern French schools; the Goldblatt Collection of paintings, including the famous "On the River Stour," by Constable, dispersed in Chicago; a selection of paintings of the Dutch, English and Barbizon schools from the collection of the late Senator W. A. Clark; the C. G. K. Billings collection of exceptionally fine examples of the Barbizon School, and the famous "Willow Tree" by "Old"

Crome, which was acquired by the Independent Gallery of the city of Norwich, England, the artist's birthplace; the Samuel T. Shaw Collection of American Paintings; the collection of Mr. Vincent Astor; the Tolentino Collection of Italian Renaissance art, paintings, sculpture, and tapestries; the Benguiat Collection of Oriental Rugs, containing some superb Persian examples; a selection of paintings from the collection of Scott and Fowles, art dealers in New York; the Arlington Art Gallery Collection of paintings; and a unique number of Gothic tapestries known as the Kermaingant Collection.

Outstanding single sales included: the bust portrait of Mrs. Davenport by Romney, acquired at auction in London by a New York dealer for \$300,000, a top-notch price; a fine "Portrait of a Nobleman," sold to a private collector in America; an example of a very rare French primitive, Jean Bellegambe, "Conversion of Saint Paul," acquired in a Paris auction by a New York dealer; the discovery and purchase for an American private collection of the 40th known painting by Vermeer van Delft. Twelve of the forty are already in the United States; a portrait group, "Uncle and Niece" by Degas, acquired for a private collector; "L'Arlésienne" one of Van Gogh's finest efforts, acquired by Mr. Adolph Lewisohn; a beautiful example of the rare master, Roger van der Weyden, "Portrait of a Lady," from the Duke of Anhalt's Collection, Germany, acquired by a New York dealer. The Curtis Collection of 18th century paintings was enriched by two fine portraits, a Hoppner and a Thomas Beechey. The last important auction of the season was the famous Chiesa Collection of Italian paintings, sculptures, terracottas and majolica ware. Among the paintings were examples by Orcagna, Daddi, Antonella da Messina, Lotto and Roger van der Weyden. The Gutenberg Bible, Melk edition, was sold at auction for the record breaking price of \$106,000. In Amsterdam occurred the second and third sales of the important Castiglione Collections of paintings, of old masters, sculpture, furniture, and objects of art; the superb collection of drawings from the de Robiano Collections, with examples by Michael Angelo, Rubens, Dürer, Rembrandt and Breughel, a collection of Dutch and Flemish paintings, and the Dietal Collection of Barbizon masters.

Important auction sales in Paris were: the Warneck Collection of early Dutch and Flemish masterpieces; the Dutasta Collection of 18th century French objects of art of highest quality; the Pierre Decourcelles Collection of modern paintings, with fine examples of Toulouse-Lautrec. In London, besides those already mentioned occurred: the H. L. Bischoffsheim Collection of English 18th century portraits and the famous portrait of Elizabeth, Queen of Spain, by Sir Antonio Mor; the dispersal by auction of the furnishings and paintings of the historic Netherby Hall, Cumberland; the Brölemann Collection of early illuminated manuscripts; the collection of Lord Carmichael, of old masters; the Carlisle Collection of English paintings of the 18th century; and the remainder of the collections of the late Lord Leverhulme.

**ASBESTOS.** The asbestos production of the world in 1925 was estimated at 330,892 long tons as compared with 256,438 long tons in 1924. The chrysotile, or long-fibre asbestos used in spinning, is derived in large measure from Can-

ada and South Africa; while the short-fibre amphibole is found in Australia, India, Russia, and the United States. The world's production of unmanufactured asbestos in the years 1925 and 1924 is given in the accompanying table:

WORLD PRODUCTION OF UNMANUFACTURED ASBESTOS  
[In long tons]

Country	1924	1925
Canada .....	208,762	273,522
South Africa:		
Rhodesia .....	26,141	34,349
Union of South Africa .....	6,464	9,078
Cyprus .....	3,904	(*)
Russia .....	8,331	10,000
Italy .....	2,126	2,490
India .....	125.8	(*)
Australia .....	78	(*)
China .....	239	330
United States .....	268	1,123

\* Figures not available.

Prior to the World War the asbestos mines of Russia produced a large percentage of the world's supply and in 1926 they were said to be assuming their pre-war output. In the United States the output of unmanufactured asbestos in 1925 was 1258 short tons, valued at \$51,700, consisting of 93 tons of chrysotile mined in Arizona and California, and 1165 tons of amphibole mined in Georgia, Idaho, and Maryland. In 1924 the production was 300 short tons, valued at \$42,526. The imports in 1924 and 1925 were 183,250 short tons valued at \$5,602,945 and 230,520 short tons valued at \$7,134,302 respectively.

**ASPHALT.** The native asphalt and related bitumens produced in the United States and sold at the mines in 1925 amounted to 584,850 short tons, valued at \$4,148,400. The asphalt manufactured in the United States from petroleum and sold at refineries in 1925 included that produced from both domestic and foreign petroleum. From domestic petroleum 1,206,700 short tons, valued at \$15,305,760, were manufactured, and from foreign petroleum 1,971,670 tons, valued at \$27,520,010. In 1925 the crude asphalt imported for consumption in the United States amounted to 113,384 tons, valued at \$823,165, while the ozokerite amounted to 3088 tons, valued at \$361,767. Ichthyol to the amount of 560 pounds, valued at \$1281, and bituminous limestone amounting to 8778 tons, valued at \$84,259, all helped to swell the total, which amounted to \$1,270,472 in value. The native asphalt and related bitumens exported from the United States amounted in value to \$3,351,271, consisting of 32,835 short tons of unmanufactured material valued at \$825,654, and manufactures, including squares of roofing asphalt, at \$2,525,618. In 1925 there were exported 89,014 short tons of petroleum asphalt, valued at \$1,762,048.

**ASTRONOMY.** The well known giant and dwarf theory of stellar evolution was largely based upon, and served to explain, the fact that if the stars be classified according to *absolute magnitude* and *spectral type*, they fall into three groups: (1) The "main sequence," running continuously from intensely luminous O type

stars to faint M Stars, which includes all ordinary dwarfs as well as most O, B, and A stars, and in which luminosity decreases rapidly with increasing redness; (2) the "giant stars," fairly widely scattered, yet showing comparatively little variation in absolute magnitude with spectral type, which form a side group that joins the main sequence near type F, but which does not link on continuously—scarcely any giants of type F exist (such as do occur mostly being unusually luminous and massive), as if this stage were rushed through rapidly after a temporary halt in the giant M, K, and G stages; (3) the "white dwarfs," faint and hot, of low luminosity but high surface temperature, of which comparatively few have yet been discovered, but which must actually exist in space in enormous numbers.

However, it has been found that because of the excessive degree of ionization of the atoms in the intensely hot interiors of the stars, the dwarfs as well as the giants obey the laws of perfect gases and are in radiative equilibrium, and this discovery shows that the evolutionary progress of a star through the above groups, if such occurs at all, cannot be due to the cause assigned by the giant and dwarf hypothesis; the low surface temperatures of the dwarfs, e.g. must be due to increased opacity rather than to lower temperatures as a whole.

Reconstruction of the theory of stellar evolution is to be based upon the knowledge of physical conditions and internal construction of the stars that has been made possible by modern atomic physics. The outstanding problem of the physics of the stars is that of the source of stellar energy; whatever this source, it must, as a great mass of geological and astronomical evidence indicates, provide a time scale that will allow at least  $10^9$  years for the life of the sun, and it must liberate heat deep in the interior so that the temperature gradient necessary to prevent the gravitating mass from collapsing will be kept up. The law of generation of internal heat in a star, together with the rate of escape of heat to space, will determine how bright and hot a star of a given size and mass will be; the rate of escape is determined by the opacity and the temperature gradient, and the latter may be calculated from physical theory. Russell finds that neither the distribution of density in a star, nor the distribution of the source of energy, will have much effect on the rate of escape of heat. Stars of the same mass are found by observation all to be about equally bright, regardless of size and spectral type; but different investigators disagree as to the physical explanation of this phenomenon. However, it is now generally agreed that the only source of energy which will provide an adequate time scale, and which will allow the mass of a star to change as the star evolves so as to satisfy the mass-luminosity law, is the actual annihilation of matter and its transformation into an equivalent amount of radiant energy; the exact mechanism of this process is uncertain, but the transformation may come about as the result of the mutual annihilation of an electron and a proton, with the resultant production of a "splash" of radiant energy of exceedingly short wave length that by subsequent interaction with the material of the interior of the star is soon transformed into ordinary temperature radiation; possibly the escape of some of the short

wave rays from tenuous nebulae may be one source of the penetrating cosmic rays observed by Millikan.

The first stage in the history of a star that can now be visualized is that of a large sphere of very rarefied gas, with a central temperature of a few hundred thousand degrees. Losing heat (and also mass) by radiation, the star contracts, at first very rapidly, drawing upon its gravitational energy, and rising in temperature. Now, according to Russell and Eddington, when the central temperature reaches some critical value, probably less than a million degrees, the degradation of some form of matter, either wholly into energy or into some less massive form with emission of energy, begins; some very active, but soon exhausted, supply of energy is tapped at first, during the giant stage.

The rate of evolution depends on the rapidity of exhaustion of the transformable material; as the latter is used up at the centre, the star slowly contracts, the temperature rises to keep up the liberation of heat, and new regions nearer the surface become the main seat of the transformation. The rate of transformation is assumed to increase with temperature, and several forms of matter are supposed to be present, each form beginning to be transformed into energy in large amounts at a different "critical temperature." All the stars of the main sequence have approximately the same central temperature (30 or 40 million degrees), as may be computed from physical theory, and Russell supposes that in the neighborhood of this temperature the rate of transmutation of matter into energy increases very rapidly, the principal supply of energy then becoming available through the annihilation of the main mass of the star; a higher central temperature would cause heat to be generated faster than it could escape, so that the star would expand and cool again. Hence, when the above central temperature is reached, the star goes down the main sequence, steadily decreasing in mass and in luminosity, gradually growing denser and more opaque; the surface temperature rises during the giant stage, then falls along the main sequence, but the internal temperature does not fall; the giants are cooler than the dwarfs inside, while the white dwarfs are still hotter.

Eddington suggests that perhaps at the central temperature of the main sequence, energy issues from matter like steam from water at  $100^\circ\text{C}$ .; when the main constituents become exhausted, however, there must still remain an unburnt residuum of more refractory material, immune to transformation even at 30 million degrees, and this passes on to the fiercer ordeal of the white dwarf stage. The final stage of all is uncertain.

On the other hand, Jeans maintains that if an increase of temperature resulted in an increased rate of generation of energy, the stars would be unstable; besides, stellar temperatures are not high enough perceptibly to influence subatomic processes. He supposes different types of matter to transform spontaneously at different, but constant, rates; the most active would of course be first exhausted, so that young stars, having more of the most active types of material, would emit more radiation per unit mass than would older stars, as they are observed to do. A star would be born as a supergiant, of density about  $10^{-7}$  probably with a surface tem-

# ISLAND UNIVERSES

THE STAR CLOUD N. G. C. 6822 IN SAGITTARIUS LIGHT, TRAVELING AT A SPEED THAT WOULD GIRDL THE EARTH SEVEN AND A HALF TIMES IN ONE SECOND, REQUIRES 700,000 YEARS TO REACH US FROM THIS SYSTEM

perature too low for visibility, and possibly as a long-period variable undergoing violent pulsations such as are conjectured to exist in Betelgeuse; the tendency to develop such pulsations determines the low-temperature limit of existence for red giants of low density and great size.

The composition of the star as regards actively transforming constituents would determine the rate of emission of energy and of loss of mass. To be in equilibrium the star would have to adjust itself so that a certain mathematical relation between absolute magnitude, surface temperature, and mass would always be satisfied. It would first travel along the giant sequence, the temperature rising, and more and more of the material becoming highly ionized; but as the extent of ionization increased, the rate of generation of energy would decrease (bare nuclei apparently being incapable of transformation into energy), and before 100% ionization was reached a state of equilibrium would be attained in which the rate of generation of energy would be equal to the rate of radiation appropriate to the mass and spectral type; the star would now turn and go down the main sequence, decreasing in temperature. In time, as the amount of active material decreased, the generation of energy would get too small to supply the minimum possible loss by radiation, and the star would become unstable; it would then contract rapidly, drawing upon its gravitational potential energy, and stability would be regained only when the density became so high that the gas laws no longer held even for the ionized atoms; the star would now be a white dwarf of density about  $10^5$ . The above instability accounts for the gulf between the giants and dwarfs in the redder spectral classes.

According to Jeans, the bulk of the material in the interiors of the sun and the stars consists of elements of far higher atomic weight than any known on the earth, and it is these substances which are capable of transforming rapidly into energy and supplying the radiation of the stars; the terrestrial elements either do not transform at all, or only very slowly.

Unless a star had initially a very slow rotation, the acceleration of rotation that accompanied the contraction would cause fission into a binary, accompanied by a rise of surface temperature; the heavier component would appropriate the central portion of the original star where the heaviest elements, making up most of the active source of radiation, would be concentrated; this theory explains the early spectral types of spectroscopic binaries, and also accounts, e.g., for the unhappy state of the companion of Sirius, which, lacking energy-generating materials, was unable to make both ends meet in the matter of radiation, and became a white dwarf. Short-period and Cepheid variables may be stars in the process of breaking up into binaries.

**ISLAND UNIVERSES.** Our own stellar system, or galaxy, has been found to be not alone in space; beyond its confines, even as outlined by the globular clusters, are millions of other galaxies, many of which are comparable with our own universe. Hubble finds that nearly all the non-galactic nebulae fall into a regular sequence of forms ranging from small, compact, globular nebulae through flattened, expanded, elliptical forms, to closely-wound spirals, and finally widely open disc-shaped spirals with

arms which in some cases have been resolved into myriads of individual stars; this sequence conforms closely to that of Jeans' theories of cosmogony. The application of the period-luminosity relation to the Cepheid variables in the arms of Messier 33, together with a great deal of other corroborative evidence, has shown the distance of this system to be 850,000 light years, and its diameter 15,000 light years; the Andromeda nebula is similarly found to be 900,000 light years distant, and 45,000 in diameter.

A statistical study of the non-galactic nebulae shows them all to be of the same general order of absolute luminosity, with an average mass about 300,000,000 times that of the sun, and distributed rather uniformly in space. The mean absolute magnitude is about -15.0; this, with the apparent magnitude, permits an estimate to be made of the distances. The faintest nebulae that can be detected with the 100-inch telescope at Mount Wilson thus lie at an average distance of the order of 150,000,000 light years, and a sphere of this radius represents the region of space at present observable; objects at this distance are now being seen as they actually looked in past geological ages—events occurring in the heavens at the present time, though on their way to the earth and traveling with the speed of light, may not find man here to receive them when they arrive; however, with faster photographic plates and larger telescopes it will be possible to push the boundaries of the observable region of space back several times further, and with improvements believed to be practicable, to detect exceptionally brilliant nebulae at a distance of a thousand million light years, with light that started on its way when the earth itself was young.

**ASTROPHYSICS.** As an animalcule living in a drop of water might learn something of the laws of liquids by experimenting with his drop, but considerably more by observing the behavior of the torrents pouring over Niagara, so the physicist may learn much of the laws of matter and energy in his terrestrial laboratory, but incomparably more by observation of the Niagaras of the sky—the phenomena in cosmical laboratories of the stars, in which are involved stupendous amounts of energy and extreme conditions of temperature and pressure far surpassing anything attainable on the earth, and which take place through regions of space and intervals of time of incomprehensible magnitude. It is of considerable interest and importance that the laws found to hold in the narrow range of conditions obtaining in the laboratory are also valid under the conditions existing in, and throughout the lives of, the celestial bodies, needing only to be extended and supplemented but not rejected; and that the system of laws applying to bodies in the region near the earth also give every evidence of still holding good in the remote depths of the farthest observable reaches of space where lie the distant island universes.

**SUN.** Jeans has pointed out that since radiation possesses inertia, it carries momentum with it, and in passing through the stars produces effects of exactly the same nature as those due to molecular viscosity, but, in the gaseous stars, of much larger magnitude. This radiative viscosity is of importance in a number of astrophysical phenomena; among other things, it

affords a possible explanation of the equatorial acceleration of the sun.

The sign of the general magnetic field of the sun has remained the same through two reversals of the spot polarities; there is evidence, however, for a variation in the rate of rotation of the sun associated with the reversals.

Pettit at Mount Wilson has found large fluctuations in the amount of ultraviolet radiation emitted by the sun, the variations being directly correlated with spot activity. The Smithsonian Astrophysical Observatory, with the aid of a grant from the National Geographic Society, has established a new station on Mt. Brukkaros in Southwest Africa to obtain daily values of the solar constant. Stebbins with the photoelectric photometer has detected small irregular variations in the light of many stars, similar to those claimed by Abbot to exist in solar radiation.

No connection can be found between the polarities of spots, and the directions of whirl of the high-level vortices; the latter have a tendency to obey the same law that governs the rotation of terrestrial cyclones, and are undoubtedly hydrodynamic (not electromagnetic) in character, being induced by the spot vortex below; the origin of the latter and of its magnetic field must be in the interior of the sun. V. Bjerknes suggests the permanent existence of a sinuous sub-photospheric vortex which encircles the sun, and in places rises to the surface, penetrating into the solar atmosphere and showing two free ends that constitute a bipolar spot group; this internal vortex travels from high to low latitudes, then descends into the interior, while a second one, rotating in the opposite direction, rises to the surface in high latitudes to begin the new spot cycle.

**PLANETS.** Variations in the brightness of Jupiter's moons II, III, and IV show them to rotate on their axes in the same period that they revolve around their primary. Variations in the brightness of Uranus, associated with changes in the shape of the disk in different positions, indicate a polar compression of  $\frac{1}{10}$ . The unexplained portions of the fluctuations in the motions of the moon and other bodies apparently must be due to variations in the rate of rotation of the earth, which in turn can be brought about only by changes in the radius of the earth—oscillations of the whole crust, of amounts from several inches up to about 12 feet.

**ASTRONOMICAL PHENOMENA.** The total solar eclipse of January 14 was well observed in Sumatra. There was a great deal of activity on the sun during 1926, a number of naked eye spots appearing; several marked auroras and magnetic storms occurred as a result of solar conditions.

An unusually favorable opposition of Mars took place November 4.

Comet 1926a, a return of Tuttle, was discovered by Baade, at the Hamburg Observatory, Bergedorf, on January 12; 1926b, by Blathwayt at Braamfontein, January 16; 1926c, return of Kopff, by Wolf, July 13; 1926d, return of Finlay, by Stobbe at Bergedorf, August 3; 1926e, return of Giacobini-Zinner, by Schwassmann at Bergedorf, October 16; 1926f, by J. Comas Sola at Barcelona, November 5; 1926g, return of Neujmin 1916 II, by Neujmin (the original discoverer) at the Simais Observatory, November 5.

A suspected cometary object was seen by Wilk at Cracow, September 1. Enzor's comet, 1925f, became suddenly very faint in February, 1926; for a month its tail made an angle of  $80^\circ$  with the radius vector to the sun.

**ASTROPHYSICS.** See ASTRONOMY; PHYSICS.

**ATHLETICS, TRACK AND FIELD.** Many new stars appeared in track and field athletics during 1926 and several new world records were established. The most imposing performances were those of Dr. Otto Peltzer of Germany, who first amazed track enthusiasts by capturing the British half-mile championship in world record time of 1 minute, 51 $\frac{1}{2}$  seconds, thus bettering the standard of 1 minute, 52 $\frac{1}{4}$  seconds set in 1916 by J. E. (Ted) Meredith (U. S.). Peltzer next took the measure of Paavo Nurmi and Edwin Wide in a 1500-meter race, which was witnessed by a throng of 70,000 in Berlin, Germany. The very next day Wide, a Swedish schoolmaster, defeated Nurmi in a two-mile contest and established a world record of 9 minutes, 17 seconds for the event.

Charles Hoff of Norway was another European to distinguish himself during 1926. In the course of an American tour Hoff shattered pole-vault records with most consummate ease and scored triumphs over Harold Osborn and Emerson Norton, two American all-around champions. Unfortunately, as the result of allegations of irregularities in his expense money, Hoff turned professional and brought suit against the Amateur Athletic Union of America, charging conspiracy. This suit was eventually settled by the Amateur Athletic Union, but Hoff did not regain his amateur status.

Charles Paddock and Roland Locke, both of the United States, set new world sprint records, Paddock covering 100 yards in 9 $\frac{1}{10}$  seconds, and Locke negotiating the 220 yards in 20 $\frac{1}{10}$  seconds.

Many new champions were crowned in the national championships of the Amateur Athletic Union and they will form the nucleus of the United States team in the 1928 Olympics which are to be held at Amsterdam, Holland. Seven athletes lost the titles they had won in 1926, but F. Morgan Taylor in the 440-yard hurdles, De Hart Hubbard in the broad jump, Harold Osborn in the high jump and decathlon, Harry

Hinkel in the three-mile walk, Clarence Houser in the discus throw and Matt McGrath in the hammer throw all successfully defended their championships.

The A. A. U. title holders for 1926 follow: 100-yard dash, Charles Paddock, Hollywood A. C.; 220-yard dash, George Sharkey, Miami University, Oxford, Ohio; 440-yard run, Kenneth Kennedy, Illinois A. C.; 880-yard run, Alva Martin, Chicago A. A.; mile run, Lloyd Hahn, Boston A. A.; six-mile run, Philip Osif, Haskell Institute; 120-yard high hurdles, Leighton Dye, Hollywood A. C.; 220-yard hurdles, Kenneth Grubles, Hollywood A. C.; 440-yard hurdles, F. Morgan Taylor, Illinois A. C.; three-mile walk, Harry Hinkel, New York A. C.; running high jump, Harold Osborn, Illinois A. C.; sixteen-pound hammer throw, Matthew McGrath, New York A. C.; javelin throw, John Kuck, Kansas State Teachers' College; running broad jump, De Hart Hubbard, Century A. C.; sixteen-pound shot put, Herbert Schwarze, unattached, Chicago; pole vault, Paul Harrington, Boston A. A.; hop, step and jump, Levi Casey, Los Angeles A. C.; throwing 56-pound weight, Patrick McDonald, New York A. C.; discus throw, Clarence Houser, Hollywood A. C.; decathlon, Harold Osborn, Illinois A. C.; pentathlon, T. W. Dreves, New York A. C.; 7-mile walk, Harry Hinkel, New York A. C.; 880-yard relay, Newark A. C.; 2-mile relay, Boston A. A.; mile relay, Illinois, A. C.; 440-yard relay, Newark A. C.; 4-mile relay, Illinois A. C.

For the second successive year the University of Southern California won the Intercollegiate A. A. A. A. championship with a total of 35½ points. Stanford University finished second with 25½ points and Yale third with 25½ points. The individual winners with their colleges were:

100-yard dash, Russell, Cornell; 220-yard dash, Russell, Cornell; 440-yard run, Cooke, Syracuse; 880-yard run, Watters, Harvard; mile run, Haggerty, Harvard; two-mile run, Tibbetts, Harvard; 120-yard hurdles, Dye, Southern California; 220-yard hurdles, Grubles, Southern California; discus throw, Houser, Southern California; broad jump, Dowling, Georgetown; high jump, King, Stanford; hammer throw, Biggs, Syracuse; shot put, Houser, Southern California; pole vault, Carr, Yale; javelin throw, Harlow, Stanford.

The Oxford-Cambridge versus Princeton-Cornell meet held at London, England, in July resulted in a victory for the British collegians by a score of seven first places to five. The winners in the various events were: 100-yard dash, Russell, Cornell; 220-yard dash, Russell, Cornell; 440-yard run, Rinkel, Cambridge; 880-yard run, Fryer, Cambridge; mile run, Starr, Cambridge; two-mile run, Fooks, Cambridge; 120-yard hurdles, Burghley, Cambridge; 220-yard hurdles, Burghley, Cambridge; high jump, Vangreyzee, Cambridge; pole vault, Bradley, Princeton; broad jump, Dikeman, Princeton; shot put, Sullivan, Cornell.

There was considerable activity among the women athletes of the United States, culminating in the national championships held at Philadelphia where one world record and five American marks were broken. The individual star was Miss Lilian Copeland of Pasadena, Cal., who established one world record and captured three titles. The winners in the several events were:

50-yard dash, Etta Cartwright, Northwestern California A. C.; 100-yard dash, Rosa M. Grosse, Toronto Ladies A. C.; 60-yard hurdles, Helen Filkey, Midwest A. C., Chicago; running high jump, Catherine Maguire, Coliseum A. C., Chicago; running broad jump, Nellie Todd, Midwest A. C.; shot put, Lilian Copeland, Pasadena A. and C. C.; javelin throw, Lilian Copeland; discus throw, Lilian Copeland; throwing baseball, Mabel Holmes, Paterson R. C.; 440-yard relay, Toronto Ladies, A. C. See CROSS COUNTRY RUNNING.

**AUSTRALIA,** COMMONWEALTH OF. A self-governing dominion of the British Empire, consisting of the six original states (formerly colonies) of New South Wales, Victoria, Queensland, South Australia, Western Australia, and Tasmania, together with the Northern Territory and the Federal Territory, and comprising the island continent of Australia with its dependencies. The present Commonwealth dates from its proclamation in 1901, under the act of union passed in the preceding year. Of the divisions mentioned above, the Northern Territory was transferred by South Australia to the Commonwealth; and the Federal Territory consists of a former portion of New South Wales. At the beginning of 1926 the seat of the government was at Melbourne, but it was expected that the parliamentary meeting for that year would be held at the new capital Yass-Canberra, on which building operations were begun in 1923.

**AREA AND POPULATION.** The area of Australia is 2,974,581 square miles and the population according to the census of April 4, 1921, 5,435,734. The population was estimated at 6,017,289 on March 31, 1926. The accompanying table from a report of the Commonwealth Statistician and Actuary gives the area in square miles and the population according to the census of 1921, and also the estimated population by states on March 31, 1926:

States and Territories	Area sq. miles	Population	
		April 4, 1921	March 31, 1926*
New South Wales ..	309,432	2,100,371	2,308,333
Victoria .....	87,884	1,531,280	1,691,486
Queensland .....	670,500	755,972	867,643
South Australia ..	380,070	495,160	555,740
Western Australia ..	975,920	332,732	372,732
Tasmania .....	26,215	213,780	212,139
Northern Territory ..	523,620	3,867	3,701
Federal Capital Territory .....	940	2,572	5,515
Total .....	2,974,581	5,435,734	6,017,289

\* estimated.

The above figures do not include the full-blooded aborigines, whose number was estimated at 60,000. The figure for 1926 represents an increase of 112,618 during the year, of which 79,937 is accounted for by excess of births over deaths and 32,681 by net immigration. In all states except Tasmania increases were shown, New South Wales leading with a net increase of 43,535, followed by Victoria with 24,390, Queensland, with 25,414, South Australia with 14,233, and Western Australia with 6355. New South Wales and Victoria account for more than half the total population, having 2,308,333 and 1,691,486, respectively. Australia's net gain

in population by immigration during 1925 amounted to 37,357, a somewhat smaller increase than during the preceding year, but slightly greater than the average for the past five years, according to figures compiled by the above mentioned source. Arrivals during the year reached 100,075, against 62,718 departures. Approximately 83 per cent of the new arrivals were British whites, and 12 per cent from other white races. New South Wales and Victoria together absorbed more than two-thirds of the total net increase. During the same year there were 135,792 births, 54,568 deaths, and 40,899 marriages. The populations of the capital cities with their suburbs on Jan. 1, 1926, were as follows: Sydney, New South Wales, 1,039,390; Melbourne, Victoria, 912,130; Brisbane, Queensland, 263,711; Adelaide, South Australia, 303,614; Perth, Western Australia, 179,388; Hobart, Tasmania, 58,740.

**EDUCATION.** At the end of 1924, New South Wales had 3259 government schools with 10,400 teachers and 333,074 pupils enrolled; 693 private schools with 4200 teachers and 82,545 pupils. Victoria in 1923 had 2460 state schools with 6919 teachers and a total enrollment of 253,307 students; in 1924 there were 486 private schools with 2154 teachers and an enrollment of 63,105 scholars. During the year 1924 there were in Queensland 1688 state schools with 4122 teachers and an average daily attendance of 104,283 pupils; 169 private schools (1923) with 4129 teachers and an average daily attendance of 20,900 pupils. South Australia in 1924 had 1078 state schools with 83,483 children under instruction; 186 private schools with 15,063 students. In the same year Western Australia had 789 state schools with 51,726 students enrolled; 117 private schools with 11,336 enrolled. In Tasmania nine-tenths of the primary teaching is at state schools. In addition to the above there are various high and technical schools in all the states. The capital of each state is the seat of a university: Sydney (1924), 2688 students and 203 professors, etc; Melbourne, (1924), 2423 students; Brisbane, (1924), 447 students; Adelaide (1913), 720 students; Perth (1913), 182 students; Hobart (1924), 230 students.

**PRODUCTION, ETC.** According to statistics supplied by the Commonwealth Statistician and Actuary, the total area under crop acres in 1924-25 was 17,278,000; the value of agricultural production, £107,096,000; and the value of crops per acre £6/4/0. The area under the principal crops, and the total yield and the yield per acre in 1924-25 were as follows: Wheat, 10,825,000 acres, 164,559,000 bushels, 15.20 bushels per acre; oats, 1,165,000 acres, 19,394,000 bushels, 16.65 bushels per acre; barley, 260,000 acres, 5,066,000 bushels, 19.47 bushels per acre; maize, 399,000 acres, 12,432,000 bushels, 31.16 bushels per acre; hay, 3,026,000 acres, 4,068,000 tons, 1.34 tons per acre; potatoes, 139,000 acres, 332,000 tons, 2.39 tons per acre; sugar cane, 274,000 acres, 3,400,000 tons, 19.38 tons per acre; orchards, 277,000 acres, £7,417,000 in value; vineyards, 114,000 acres, 13,299,000 gallons produced.

The 1925 livestock census showed 93,155,000 sheep, 13,309,000 cattle, 2,292,000 horses, and 980,000 pigs. The production of wool was 729,243,000 pounds; butter, 313,952,000 pounds; cheese, 31,442,000 pounds; condensed and pow-

dered milk, 62,009,000 pounds; bacon and ham, 69,312,000 pounds. The value of pastoral and dairy production was £167,081,000; exports of Australian pastoral products, £80,388,000; exports of Australian dairy products, £12,309,000.

The following table supplied by the above mentioned source shows the value of the mineral production of Australia for 1924 and 1925:

MINERAL PRODUCTION—VALUE, AUSTRALIA,  
1924 AND 1925  
[000 omitted]

Mineral	1924	1925*
Gold	3,144	2,375
Silver and lead	4,828	5,982
Copper	976	757
Tin	741	753
Zinc and concentrates	1,391	1,135
Coal (brown)	41	166
Coal	11,574	11,375
Limestone flux	267	240
Iron (pig)	519	525
Iron ore and flux	667	675
Precious stones	45	63
Salt	141	178
Value all mineral production	24,646	24,600

\* Preliminary.

Although approximately 95 per cent of Australia's total exportation consists of primary products, there is nevertheless a well developed and well protected manufacturing industry which supplies more than three-fourths of the domestic requirements. In 1925 there were 20,795 factories, employing 440,000 hands, paying £81,360,000 in wages, and an average wage of £192. The raw materials used were valued at £221,994,000; the value added in the manufacturing process was £147,137,000; the total value of the manufactured product was £380,844,000; the value of the lands and buildings was £91,242,000; and the plants and machinery were valued at £109,243,000.

**COMMERCE.** According to the United States Bureau of Foreign and Domestic Commerce, Australia's overseas commerce during the year ending June 30, 1926, showed a considerable excess of imports over exports, owing to the year's poor wheat crop. While the value of merchandise imports increased from £146,595,000, in the preceding year, to £151,020,000, merchandise exports declined from £159,962,000 to £142,618,000—a loss of £17,344,000. The stability of Australia's export trade depends very largely upon the quantity and quality of wool and wheat produced and the prevailing world price level of these commodities, as normally they make up more than half of the total Commonwealth export. The wool clip during 1925-26 was good and prices were satisfactory, but the wheat yield was short, causing the value of wheat exports to decline £17,575,197. Several other export items of lesser importance, including butter, frozen beef, milk, cream, and raisins, also recorded declines, but these losses were largely counterbalanced by increases in the exports of mutton and lamb, fresh apples, and tinned meats.

Import business remained fairly steady, with no great changes occurring in individual articles. The total value of all commodities increased £4,425,000, as compared with the preceding year. While the total of imports during the year showed little change, several items registered considerable gains—particularly kerosene, gasoline, and lubricating oils, machinery, rubber

manufactures, undressed timbers, and unmanufactured tobacco. Slight gains were made in the receipt of silk piece goods, but woollens declined. Imports of motor vehicles showed little change in value, but, as the price level was falling throughout the year, it is believed that a large number of units were received from overseas markets. The value of trade in principal commodities during 1924-25 and 1925-26 is shown in the table following:

AUSTRALIAN FOREIGN TRADE IN PRINCIPAL COMMODITIES

Item	Period	
	1924-25	1925-26
<b>IMPORTS</b>		
Fish, preserved in tins .....	1,120,428	1,167,737
Meats:		
Preserved in tins .....	42,240	53,116
All other, including sausage casings .....	366,980	470,103
Milk and cream .....	32,359	20,388
Cocoa and chocolate .....	285,491	315,824
Confectionery, chocolate .....	25,168	35,872
Fruits, dried .....	136,185	141,905
Tobacco:		
Manufactured .....	105,071	97,648
Unmanufactured .....	2,005,939	2,250,305
Cigars .....	94,895	113,492
Cigarettes .....	203,209	297,809
Piece goods:		
Cotton and linen .....	10,932,661	10,343,323
Silk .....	5,125,909	5,257,115
Woolen .....	3,211,351	2,319,756
Carpets, linoleums, mats, etc. ....	2,971,334	2,633,563
Corn and flour bags and sacks ..	2,960,234	2,810,252
Oils (in bulk):		
Kerosene .....	862,389	921,403
Lubricating (mineral) .....	864,700	948,566
Petroleum spirit .....	5,413,264	6,564,025
Paints and varnishes .....	657,075	702,404
Electrical cable and wire, covered .....	1,327,766	1,432,941
Implements and machinery (agricultural, horticultural, and viticultural) .....	784,024	833,828
All other machines and machinery .....	6,904,192	7,556,740
Metals and metal manufactures other than machinery:		
Iron and steel—		
Bars, rods, hoops, ingots, blooms, etc. ....	1,149,670	938,150
Girders, beams, channels, joists, etc. ....	326,348	346,013
Pipes and tubes .....	1,389,130	1,569,200
Plate and sheet—		
Galvanized, flat .....	586,027	490,356
Galvanized, corrugated .....	1,853,682	1,555,156
Plain .....	997,400	853,833
Tinued .....	1,571,891	1,279,555
Vehicles:		
Motor cycles, tricycles, etc. ....	754,350	713,289
Bodies for motor cars, etc. ....	1,109,846	1,183,937
Chassis for motor cars, etc. ....	10,493,449	10,732,507
Rubber manufactures .....	2,347,019	3,240,262
Timber:		
Dressed .....	1,245,418	1,432,947
Undressed .....	3,202,527	3,883,453

Eucalyptus oil .....	75,763	73,023

Considerable change occurred in the trade in precious metals. During 1924-25, when the Commonwealth was preparing for a return to the gold standard, gold and silver imports reached the value of £10,549,000, but during 1925-26 receipts of precious metals amounted in value to only £426,000. On the export side, however, shipments of precious metals increased from £2,069,000 to £5,527,000, the increase being due almost entirely to larger exports of gold. The following table shows Australia's recent imports and exports of merchandise and treasure:

AUSTRALIAN TRADE IN MERCHANDISE AND TREASURE

Year	Imports	
	Merchandise	Gold and silver
	£	£
1913 .....	78,209,359	1,540,394
1919-20 .....	98,914,150	60,142

1925-26 .....	142,617,862	5,527,110

**FINANCE.** The annual fiscal period for 1924-25 showed the Commonwealth consolidated revenue to be £68,854,809 and the expenditures totaled £68,336,432. The estimates for 1925-26 were: revenue, £68,684,300; expenditure, £68,568,586.

The net public debt of Australia on June 30, 1925, according to statements issued by the Commonwealth Bureau of Census and Statistics, was £965,870,844, an increase of £10,859,000 during the year. This represents the smallest increase for nine previous years, while the per capita debt actually showed a decrease of £1/13/2. The gross debt is actually £71,135,472 more than as shown, this amount representing duplicating in the figures. The Commonwealth issues loans on its own security on behalf of the states, while it owes certain sums to the states on account of certain properties acquired from them. The following table reflects the growth in the public debt of Australia, 1916-1925:

## COMMONWEALTH AND STATES—PUBLIC DEBT

June 30—	Commonwealth £	States £	Deduction for debts counted twice <sup>a</sup> £	Net public debt of Australia £
1916	101,344,285	863,373,549	7,624,397	457,093,437
1917	169,229,557	379,950,506	15,067,772	534,112,291
1918	284,055,069	399,742,070	18,164,628	665,632,511
1919	325,770,747	400,576,535	22,045,516	704,301,766
1920	381,309,905	430,092,847	33,060,917	778,341,835
1921	401,720,024	474,847,459	48,551,637	828,015,846
1922	416,070,509	523,489,389	55,182,665	884,377,233
1923	410,996,316	550,878,641	56,390,011	905,484,946
1924	415,600,099	595,364,487	55,953,000	955,011,586
1925	430,948,062	606,058,254	71,135,472	965,870,844

<sup>a</sup> Sums owed by Commonwealth to States, and sums owed by States to Commonwealth.

The public debt of the states increased by £242,684,705, or 66 per cent, after June 30, 1916. Principally because of the war, the increase in the Commonwealth debt has been much greater, but after the armistice it continued to grow, increasing from 1919 to 1925 by £105,177,315. During the same period the public debt of the states increased by £205,481,719. These increases, however, contain duplications totaling £49,089,956.

COMMUNICATIONS. In 1924 the number and net tonnage of the registered vessels in the Commonwealth was as follows: Sailing, 1181 of 37,427 tons; steam, 1078 of 401,887 tons; total, 2259 vessels of 439,314 tons. In 1924-25 the number of vessels entering the ports of the Commonwealth was 1726 of 5,596,000 net tons and the number of vessels clearing was 1723 of 5,604,000 net tons.

Australian railways, after meeting interest charges and other expenses, suffered a loss of £833,008 during the year ending June 30, 1925, according to a statement by the Commonwealth statistician. On that date, there were 27,688 miles of railway open for traffic of which 24,844 miles (capital cost £276,114,845) were government owned. Of the 2844 miles of privately owned railroads, 961 miles were available for general traffic. The average capital cost of the government mileage was £11,114 per mile. The loss sustained during the year was 47 per cent less than in 1923-24. While the tonnage of goods carried increased by 2,290,000 tons to approximately 38,000,000 tons, the number of passenger journeys decreased by 1,560,000 to 370,350,000. This decrease is ascribed to motor-bus competition, particularly in Victoria. Electric tramways operated 62,000,000 car-miles and 622,000,000 passenger journeys were made. The gross revenue for the year (£6,248,686) exceeded the working expenses (£5,170,814) by £1,077,872.

Work on the unification of Australia's railway gauges is progressing slowly. In 1921 a royal commission appointed to investigate the question of a standard gauge estimated the cost of unifying the Fremantle-to-Brisbane gauges at £21,600,000, and the cost of conversion of all Australian lines at £57,000,000. However, it is now considered that the work will considerably exceed this estimate.

The first step in the unification of the Fremantle-to-Brisbane gauge was marked by the commencement of work on the line between Grafton (New South Wales) and Brisbane (Queensland), a distance of 180 miles. It is estimated that this line would not be com-

pleted under a cost of £4,000,000. The work was to be done in four sections. The 4-foot 8½ inch gauge between Grafton and Kyogle was being strengthened by the substitution of 80 pound for 60 pound rails. This work was being carried on by the New South Wales Government and was near completion. Between Kyogle and the Queensland border (26½ miles) the work was to be done by New South Wales at a cost of £1,045,806. The announcement was made during the year that this line would probably be commenced in the immediate near future.

The 60½ miles in Queensland was to be built by the Queensland Government at an estimated cost of £1,030,142. There remained an 8 mile section, which the Queensland Government was constructing. When the unified gauge was completed Queensland would be greatly benefited, as the route would open new avenues of trade. More than 100 miles would be saved, traveling would be quicker and more comfortable, and there would be no more changing of trains at the border.

The next step proposed in the unification was the construction of a 4-foot 8½-inch gauge from Port Augusta, South Australia, to Red Hill, and the laying of a third rail from there to Adelaide, in accordance with the recent hearings held in Melbourne and Adelaide by the Federal public works committee. The royal commission in 1921 rejected all proposals for the use of a third rail on wide gauges. The cost of the project was estimated at £734,923. By using the proposed Port Augusta-to-Red Hill line it was said that over five hours would be saved and two breaks of gauge would be eliminated. The completion of this scheme will mean that on the journey from Perth to Adelaide there will be only one change of trains, that at Kalgoorlie. When the 3-foot 6-inch narrow gauge from Kalgoorlie to Perth is standardized, the transcontinental train will run from Fremantle to Adelaide without change.

After the foregoing work has been completed, it is probable that the standardization of the wide-gauge line from Adelaide to Melbourne and thence to Albury will be undertaken. This is the last stage in the unification of the Fremantle-to-Brisbane line, and its completion will give a unified gauge for a distance of 3486 miles.

The main difficulty of the breaks in gauges is not the mere handling charges for goods transferred, but the serious detention of rolling stock over long periods. The majority of the people of the Commonwealth are very strongly in favor of unification of gauges, and apparently it is only a matter of time until this becomes an actuality.

The annual report of the commissioners of the Australian State Railways for the year ended June 30, 1926, shows that the capital expenditure totaled £26,267,702, including lines under construction; this represents an increase of £1,923,649 over the previous year. The cost of open lines, with rolling stock and equipment amounted to £25,992,778, against £24,046,604 for 1925—an increase of £1,946,174. The earnings, amounting to £4,262,174, represented a net increase of £249,438. The ordinary working expenses were £3,121,145 and the interest on capital £1,195,108, the total of £4,316,253 showing a deficit for current operations of £54,079. Accumulated and deferred charges aggregated

£3,982,314, showing a total accumulated deficit of £4,036,393.

**GOVERNMENT.** The executive power is vested in the king, who acts through the governor-general, assisted by an executive council of responsible ministers who must be members of the Federal Parliament. Legislative power, where it is not specially reserved to the states, is vested in a Federal Parliament, comprising a senate and house of representatives. The senate consists of at least six senators from each of the original states, elected for six years, one-half of whom are renewed every three years; while the house of representatives consists of approximately twice as many members as there are senators, the representation being in proportion to the population as shown at the last census. The number in the house in 1926 was 76. The governor-general at the beginning of 1926 was John Lawrence Baron Stonehaven. The ministry was as follows: Prime Minister and Minister of External Affairs, Stanley Melbourne Bruce; Treasurer, Dr. E. C. G. Page; Vice-president of the Executive Council, George F. Pearce; Home and Territories, Sir Thomas W. Glasgow; Attorney-general, John G. Latham; Postmaster-general, William G. Gibson; Trade and Customs, Herbert E. Pratten; Works and Railways, William C. Hill; Defense and Health, Sir Neville R. Howse; Markets and Migration, Thomas Paterson; Honorary Ministers, Thomas W. Crawford and Charles W. C. Marr.

**HISTORY.** The chief interest in Australian politics during the year centred around the rather extended meeting of the Federal Parliament, which was opened by Lord Stonehaven on January 13. His opening speech dealt with various measures to be proposed by the government which included stringent measures regulating the relations of the state and capital and labor, probably because of the seriousness of the strikes which had convulsed the country during 1925. He made a severe attack on all forms of communism and stated that measures would be introduced to completely forbid the establishment of any organization, political party, or otherwise which had as its motivating cause the overthrow of constitutional government. The law was to have "teeth" by providing for rigorous punishment for any persons organizing such agencies. As a direct result of the waterside strike of the previous year he suggested the enactment of laws preventing interference of any kind with the transportation of foodstuffs or passengers. Along the same lines he suggested that the laws regulating labor be changed so as to permit the members of trade organizations to control their own leaders by means of a secret ballot, as well as a law to increase the efficiency of the Labor Arbitration Court. Other measures suggested were the securing of a uniform railway gauge throughout the country, the development of the Northern Territory, and the strengthening of the national defense.

Towards the end of January, Parliament started work on the recommendations of Lord Stonehaven. The Commonwealth Crimes Bill included penalties of deportation and severe punishment for any person or persons advocating the overthrow of the government, by force or violence, as well as the government of any state of the Commonwealth, and made the same provisions for persons destroying or injuring the

property of the Commonwealth or of property used in trade or commerce, either among the several states or with foreign countries. The bill concerning the Northern Territory provided for the division of that section along the 20th parallel, into two divisions, the northern one to be controlled from Darwin and the southern from Alice Springs. The purpose of this measure, according to Prime Minister Bruce, was the necessity for populating the northern part of the country as a surety of national safety. The parliament adjourned on March 26 for six weeks after passing the government's tariff bill with slight changes.

During the summer several changes occurred in the cabinet. Sir R. V. Wilson, the Minister for Markets and Migration, resigned and was succeeded by Mr. Patterson, of the Country Party. L. Atkinson, the Vice-President of the Executive Council, also resigned and was succeeded by Sen. B. F. Pearce, who had previously been Minister for Home and Territories, his successor in that position being Maj-Gen. Sir William Glasgow. During the same period Premier Bruce secured the passage of the so-called Migration and Development Act, which provided for a commission of four to make an exhaustive study of the resources of Australia to determine the amount of immigrants that could be assimilated. The commission was to work in close harmony with the various states and was given large powers of initiating and approving schemes for development. This commission was also given full charge of the division of a loan of £34,000,000 among the several states for purposes covered by the above mentioned bill.

**REFERENDUM.** According to the Australian constitution, amendments must be approved by an absolute majority of the total votes but by a majority of the votes in at least four of the six states. On September 4 the voters of Australia rejected by an overwhelming majority two proposals set before them by the government. They dealt with the economic laws mentioned above as having been passed by parliament. The first one was primarily concerned with the regulation of industry and commerce by the federal government and the second gave the government the power to operate any public utility when its service was interrupted or threatened for any reason. The total vote, largely because of the compulsory voting law of Australia (see preceding YEAR BOOK), was in the neighborhood of 2,500,000, and the negative majority against the first amendment was 353,806 and against the second 381,510. Only New South Wales and Queensland voted in favor of both questions, undoubtedly because these two states had suffered mostly from the strikes of 1925. The press in general did not consider the rejection of the amendments as a defeat for the Bruce Ministry, but considered it a direct mandate from the people that they did not wish the powers of the federal government increased at the expense of the states. A curious feature of the amendments was the fact that both the majority and minority parties supported the measures in parliament, but quite evidently did not reflect the wishes of their constituents in so doing. Premier Bruce in commenting upon the results stated that the government could do no more than it had done and that in case of future trouble the hands of the federal gov-

ernment were tied. Australian leaders appear unanimous that the powers of the federal government must be broadened, but this vote is the fourth time (1911, 1913, 1919 were the previous instances) that the people have absolutely vetoed measures seeking this end.

On December 3, the Australian Commissioner to the United States, Sir Hugh Denison, announced that within a short time his Commonwealth would be diplomatically represented at Washington, probably in the same way that Canada and the Irish Free State were represented.

**AUSTRIA.** A republic of central Europe, proclaimed Nov. 12, 1918, after the revolution following the World War; boundaries defined by the Treaty of St. Germain, signed Sept. 10, 1919. It consists of the following nine provinces: the City of Vienna, Lower Austria, Upper Austria, Salzburg, Styria, Carinthia, Tirol, Vorarlberg, and Burgenland.

**AREA AND POPULATION.** According to the census of Mar. 7, 1923, the total area was 32,369 square miles and the population 6,535,759, giving a density of 202 persons to the square mile. The area of the Austrian provinces before the World War was 39,012 square miles and the population, according to the census of 1910, 7,529,935. According to the 1923 census, the City of Vienna, which constitutes a province, had a population of 1,866,147, making up 28.56 per cent of the total number of inhabitants. The other chief cities with their populations on Mar. 7, 1923, were: Graz, 152,706; Linz, 102,081; Innsbruck, 56,380; Salzburg, 37,856; Wiener Neustadt, 36,956; St. Pölten, 31,619; Klagenfurt, 27,423; Steyr, 22,111; Mödling, 18,677; Villach, 16,903; Wels, 16,412; and Baden, 14,579. The movement of population in 1923 was: Births, 145,885; deaths, 99,924; marriages, 56,594; divorcees (excluding Burgenland) 5336. The number of immigrants in 1924 was 2650.

**EDUCATION.** Primary education is compulsory between the ages of 6 and 14, but exemptions are easily obtained for children of the age of 12 or over. In 1923 there were 5240 public and private elementary schools, with 31,134 teachers and 818,795 pupils. Secondary education is afforded by Gymnasias, Realschulen, middle schools, and middle schools for girls. In 1922-23 there were 141 secondary schools of all kinds with 2491 teachers and 39,043 pupils. There are three universities maintained by the state, namely, Vienna, with 890 teachers and 11,527 pupils in 1923; Graz, 253 teachers and 2757 students, and Innsbruck, with 179 teachers and 1716 students. There were also in 1923 two technical high schools; 36 training colleges for teachers; two theological high schools; high schools for agriculture, mining, art, and music; and 13 theological colleges, of which 11 were Roman Catholic.

**PRODUCTION.** Agriculture is the principal occupation of the country. In 1924 the total acreage sown was 4,694,000 acres, 2,118,250 of which were in Lower Austria and 965,500 acres in Upper Austria. The chief crops with their acreage and yield in metric tons in 1924 were: Wheat, 287,500 acres, 231,068 tons; rye, 838,475 acres, 411,235 tons; barley, 345,135 acres, 156,940 tons; oats, 771,535 acres, 331,556 tons; potatoes, 418,593 acres, 1,647,222 tons; turnips, 126,193 acres, 1,210,194 tons. In 1925 the yield

of wheat was 826,000 tons; rye, 624,000 tons, barley, 253,000 tons; and of oats, 499,000 tons. In 1923-24 the production of raw sugar was 47,256 tons. The foodstuffs produced are not sufficient to meet the needs of the population. The latest livestock census showed 282,674 horses, 1,074,993 cows, 302,216 oxen, 68,197 bulls, and 717,459 calves. Austria was deprived of many of her mineral resources as a result of the World War, but the output of her remaining mines is of considerable importance. In 1924 the production of lignite was 2,735,816 tons and of anthracite, 171,959 tons. The iron ore output was 713,805 tons, and of pig iron, 266,618 tons. Other mineral products are copper, zinc, lead, and salt. Piano-making, and the manufacture of automobiles, textiles, and tobacco are of some importance. Tobacco manufacture is a government monopoly.

**COMMERCE.** The United States Bureau of Foreign and Domestic Commerce reported that although the Austrian trade deficit was reduced from \$212,000,000 in 1924 to \$134,000,000 in 1925, the conspicuous improvement recorded earlier in the year was not maintained. Exports, which had gained during the first nine months, suffered a sharp contraction in the final quarter—especially in shipments to Germany and Poland—so that earlier gains were lost and the year closed with a 2 per cent decline from export levels established in 1924. The reduction of the trade deficit consequently, goes back wholly to a 17 per cent reduction of imports, which, both in weight and value, extended to all categories except livestock. Total Austrian imports in 1925 were valued at \$412,000,000, as compared with \$496,000,000 in 1924. A reduction in receipts of foodstuffs from \$134,000,000 reflects bumper crops. The decline in imported mineral fuels from \$41,000,000 to \$33,000,000 is a result of fuel economies, substitution of hydro-electric power for coal, and greater use of domestic lignite resources. Other raw materials and half products declined in value from \$105,000,000 to \$89,000,000, attributable not so much to reduced quantities as to lower world prices, since the decline in weight from 1,206,300 to 1,116,400 metric tons is relatively slight.

Imports of American raw cotton showed a reverse movement, increasing from 14,188 metric tons valued at \$8,000,000 in 1924 to 27,738 tons valued at \$16,500,000 in 1925. A substantial increase in receipts of copper from the United States also occurred. Imports of manufactured goods declined sharply from \$179,000,000 to \$133,000,000—a result largely, of higher import duties which became effective on the first day of the year, and of greater sales of domestic products. Austrian total exports were valued at \$278,000,000 in 1925, or slightly below the \$284,000,000 of 1924. This less favorable showing is attributed to a contraction of shipments to Poland and Germany in the last quarter of 1925, though lower prices seem to be equally responsible. Thus, the value of manufactured products exported shows a decline from \$221,000,000 to \$204,000,000, whereas an increase occurred by weight from 498,700 to 556,900 metric tons. Similarly, though the value of exported raw materials and half products increased from \$51,000,000 to \$55,300,000, a relatively greater increase occurred by weight, or

from 1,917,800 to 2,552,400 metric tons. These are the principal Austrian export categories. Changes in other classes were relatively unimportant.

Austria is one of those countries which may normally be expected to show a trade deficit and yet maintain its economic equilibrium by other foreign income sufficient to offset its excess of imports over exports. In 1924 there was evidence that these so-called invisible exports were sufficient to offset at least the greater part of a \$212,000,000 trade deficit. It is said that a large part of the industries of the former Austro-Hungarian Empire are still owned in Austria and pay dividends to Vienna. The recovery of Vienna as a commercial and financial centre contributes important foreign revenues for services rendered. To this may be added the earnings on transit traffic, tourist trade, and remittances from Austrian emigrants abroad. In 1925 the trade deficit was reduced from \$212,000,000 to \$134,000,000—a saving of \$78,000,000, or nearly \$12 per capita. On the other hand, the foreign earnings mentioned above are believed to have increased, reflecting materially greater commercial and financial activity. The Austrian schilling, which for some time has been free from all artificial restrictions and support, remained stable throughout the year.

**FINANCE.** Austria further improved its fiscal position in 1925, according to final returns announced by the Federal auditing office. The year 1923 closed with a deficit of \$22,700,000, which was met out of the proceeds of the international loan; in 1924 the deficit was cut to \$1,860,000; and in 1925 a surplus of \$10,920,000 was attained. This is the first Austrian surplus since the war, and is the more notable since it remains over and above the capital expenditures of \$12,930,000 made during the year. Capital expenditures in 1923 and 1924 included in the above totals reached \$10,860,000 and \$14,800,000, respectively. The improvement in 1925 was effected through greatly increased revenues as against smaller increase in expenditures. In 1924 actual fiscal results exceeded budgetary anticipations, but in 1925 the improvement was particularly marked. The strong fiscal position of the government has been achieved by means of heavy taxes, collected at the expense of some portion of the country's prosperity. It is stated by financial observers that the total of Federal and state taxes, estimated at \$18 per capita in 1923, had risen to \$27 in 1924 and to \$33 in 1925, as compared with \$25.50 under more favorable conditions before the war. The establishment of Austrian fiscal equilibrium at a level at which the country can more easily sustain it is therefore considered a desirable end. The 1926 budget was in fact, drawn at considerably lower levels, both in revenue and expenditure. As in previous years, a deficit was forecast, specifically \$12,070,000; but it was probable that actual performance would, as in past years, show a reduction or elimination of the deficit. Thus, in 1924, when anticipated total revenues were budgeted at 763,800,000 schillings and total expenditures at 824,900,000 schillings, actual revenues were 900,600,000 schillings, and actual expenditures were 913,600,000 schillings, leaving an actual deficit of only 13,000,000 schillings as compared with 61,100,000 schillings forecast. In 1925 total revenues were budgeted at 856,860,-

000 schillings, and the amount collected was 1,076,960,000 schillings. Actual expenditures, including an additional 16,000,000 schillings for railway electrification authorized only late in the year, rose from an estimated 930,460,000 schillings to an actual 1,000,510,000 schillings. The deficit of 73,600,000 schillings which was forecast in the budget was accordingly converted into a surplus of 76,450,000 schillings as noted.

In the 1926 budget, total revenues were forecast at 759,400,000 schillings. Although some reductions of individual tax schedules occurred, it seemed unlikely that Federal revenues amounting to 1,076,900,000 schillings in 1925 would decline in 1926 to the budget figure of 759,000,000 schillings. Expenditures were forecast at 844,700,000 schillings, including 120,900,000 schillings for capital uses. The largest increase of revenue over budget estimates has occurred in the group of direct taxes (including income, corporation, inheritance taxes, etc.) and in the sales tax—Austria's largest single levy. The largest increase of unforeseen expenditures has been for social relief purposes, occasioned by the greater volume of unemployment resulting from the final elimination of certain industries under post-war conditions, and labor economies effected in others.

In September, the finance committee of the League of Nations finally released the unallocated remainder of the international loan to Austria made by the League of Nations, which amounted to 100,000,000 schillings (\$14,125,000). Of this sum, 50,000,000 schillings was deposited with the Austrian National Bank to reduce the government debt to 128,000,000 schillings. The balance was to be devoted to the laying of international telephone cables and to local telephone expansion; reconstruction and extension of railway roadbed; and the purchase of equipment for the tobacco and salt monopolies and other government enterprises.

The budget proposals as laid before the Austrian Parliament in the fall of the year for 1927, showed substantial increases in both expenditure and revenues as compared with 1926. This is the first budget that the Austrian authorities have put together entirely on their own responsibility, without the control of the League of Nations, which was withdrawn June 30, 1926. Total expenditures foreseen for 1927 amount to 1,702,622,000 schillings, with total revenues of 1,567,173,000 schillings, leaving a deficit slightly over 135,000,000 schillings. These expenditures, however, include approximately 180,000,000 schillings for capital investment—railway electrification, hydro-electric installation, telephone cable laying, etc. Excluding investment items, the 1927 budget would show a surplus of approximately 45,000,000 schillings. In budgeting the state enterprises the government has resorted to gross figures, instead of net figures as heretofore. This practice results in an apparent increase of more than 250,000,000 schillings in the totals above indicated, whereas the actual change from the budget situation of 1926 and previous years in this respect is not great. The operating budget of the State railways is not included in the federal budget, and the expenditures which do not appear on account of the railways are largely for capital purposes.

**AUSTRIAN BUDGET PROPOSALS FOR 1927**  
*[In thousands of schillings\*]*

Item	Actual, 1925	Estimated, 1926	Proposed, 1927
<b>EXPENDITURES</b>			
Federal administration	899,823	891,055	1,067,603
Government monopolies	4,940	6,702	201,630
Government enterprises	21,554	23,956	327,828
State railways	71,349	91,516	105,561
Total	997,666	1,013,229	1,702,622
<b>REVENUES</b>			
Federal administration	865,914	755,268	919,516
Government monopolies	172,525	171,126	390,130
Government enterprises	9,418	1,869	257,412
State railways	632	456	115
Total	1,048,489	928,719	1,567,173

\*The schilling equals \$0.1407.

NOTE.—In designating the various budgets, the word "actual" refers to the final expenditures and receipts, "estimated," to the budget as passed by the legislative body; and "proposed," to the budget submitted by the government but not yet adopted by the legislative body.

**COMMUNICATIONS.** In 1924 Austria had 4114 miles of railway lines, of which 3639 miles were operated by the state, and 475 miles by private companies. The Austrian Federal Railways put into effect on July 1, 1926, a new schedule of freight rates, which are expected to average about 5 per cent above those hitherto in force, although for certain classes of merchandise the new rates will be 15 per cent and 18 per cent higher. The railway management estimated that the resultant increase in revenue would be approximately 15,000,000 schillings (\$2,150,000) annually. The new rate base is intended not only to provide additional revenue but also to assist the Austrian railways in competition with foreign systems, to promote domestic production, and to facilitate competition with foreign merchandise. The management stated that the new freight rates are lower, compared with pre-war rates, than those now in force in neighboring countries. The Austrian rates in 1926 were 12 per cent above the pre-war level, while in Germany they were 38 per cent, in Czechoslovakia 20, in Switzerland 63, and in Hungary 13 per cent higher than in 1914. In general, the rate increase has been so distributed as to fall largely on short and medium hauls; the charges for long hauls, on the other hand, have, in some cases, been reduced. It may be said against this method that it facilitates the importation of foreign goods; but it also makes the shipment of domestic merchandise over long distances comparatively cheaper, and it increases the ability of Austrian railways to compete with foreign systems operating alternative routes.

**GOVERNMENT.** Under the provisions of the constitution which went into operation on Nov. 10, 1920, Austria was declared to be a federal republic. A president is chosen for four years by the two houses of the legislature. He may not be reelected more than once. The legislature is bicameral, comprising an assembly (Nationalrat) and a First Chamber (Bundesrat). The powers of the latter body are advisory. President at the beginning of 1926, Dr. Michael Hainisch (elected in 1920 and again in 1924). The ministry as constituted on Jan. 15, 1926, was as follows: Federal Chancellor and Minister of Foreign Affairs, Dr. Rudolf Ramek; Vice-chancellor, Dr. Leopold Weber; Social Welfare, Dr. Josef Resch; Agriculture, Andreas Thaler;

Finance, Josef Kollmann; Commerce and Industry, Railways, and Food Controller, Dr. Hans Schuerff; Education, Dr. Emil Schneider; Defense, Karl Vaugoin.

### HISTORY

**CABINET RECONSTRUCTION.** On January 14, the cabinet resigned and President Hainisch almost immediately requested Prime Minister Ramek to organize a new one. This was accomplished on the very next day and, when completed, showed comparatively slight changes. As reconstructed, the ministry was constituted with the following members: Premier and Minister of Foreign Affairs, Dr. Ramek; Vice-Chancellor and Minister of Justice, Dr. Leopold Weber; Education, Dr. Emile Schneider; Social Welfare, Dr. Joseph Resch; Finance, H. Josef Kollman; Agriculture and Forests, Andreas Thaler; Trade and Transport, Hans Schuerff; Defense, Karl Vaugoin, Ramek, Weber, Schneider, Resch, and Vaugoin held the same positions in the reconstructed cabinet as they did in the old one. Dr. Ramek stated that, while he had no panacea for the economic and industrial ills of Austria he would do all in his power to expand to their fullest capacity the economic resources of Austria. He intimated, however, that not much could be accomplished without the coöperation of the rest of central Europe. Dr. Ramek's position was made rather difficult because of the Austro-Italian trouble over the Tyrol. He seemed to be satisfied with Mussolini's statement that he did not intend to violate the territory of the Tyrol but the people of that district threatened to take the matter up with the League of Nations if Dr. Ramek did not take some action. Of course, such action on the part of Tyrol would absolutely contravene the Austrian constitution. Dr. Ramek also remained aloof from any comment on the proposed union with Germany. The press discussed it from time to time but seemed to feel that such a union would surely result in the absorption of Austria by Germany and the loss of her entity as a sovereign state.

**THE TARIFF QUESTION.** Throughout the entire year the question of tariff walls between the various countries of Europe was a very live one. In Austria Dr. Resch, the Minister of Social Affairs, blamed the trade condition almost entirely for the unemployment situation in Austria. At the beginning of the year he reported that 250,000 were unemployed, while provision had been made for only 130,000 in the budget. He stated that conditions would surely get worse if Austria was unable to negotiate favorable trade treaties with her neighbors. He was borne out in this contention by economic experts of the League of Nations, who attacked the protectionist policies of Poland, Czechoslovakia, Jugo-Slavia, etc. These states seemed to have gone back to the old mercantile theory of getting as much money in their countries as possible. They preferred to build up industries at home rather than buy goods from other countries. "Export more than you import" was their slogan and it was gradually bringing central Europe, in particular, to the brink of economic chaos.

On March 27, Dr. Ramek visited Germany to negotiate a trade treaty with Germany. The German tariff wall was the most favorable to Austria, although it was only slightly lower

than that of Italy. Nevertheless it was sufficiently high to seriously interfere with Austro-German trade. Rumania advanced some of her duties as high as 600 per cent and caused a serious condition in the Austrian metal industries. Bulgaria also increased her duties to the detriment of Austrian trade in general. Although Dr. Ramek's government was essentially a believer in free trade it felt that retaliatory measures were necessary. Consequently, Austria passed measures raising her own tariff horizontally about 25 per cent. Some of the provisions were indubitably attacks on the tariffs of her neighbors, but some of them were adopted to satisfy the demands of her agricultural class that they receive protection from imports. The Social Democrats attacked the new measures from principle, but the financial class opposed them because, once granted, the farming element would oppose reductions if necessary to meet a most favored nation clause in future tariff treaties with other countries. Others felt that the new tariff law would increase unemployment because of injury to the foreign trade.

**THE SCHOOL ISSUE.** The question of the reorganization of the schools of Austria which had remained dormant for some time flared up rather unexpectedly in June and caused the resignation of Herr Schneider, the Minister of Education. After the World War the old imperial system of education was abolished and the republic had so far failed to make any satisfactory substitution agreeable to all parties. While Dr. Ramek was attending the League of Nations meeting at Geneva, the storm broke when Dr. Schneider unexpectedly released the government's proposal for educational reform. The proposal was considered too clerical and reactionary by the Opposition and was bitterly attacked by the Pan Germans, who were the chief supporting factor in the government's majority in parliament. Dr. Schneider, without getting into communication with Dr. Ramek, allowed the various groups of the Opposition to establish their own school systems in those parts of the country that were controlled by them, whereupon his own party bitterly denounced him. Dr. Ramek disapproved of Dr. Schneider's scheme and as a result, the latter resigned his position on June 10.

The school muddle was the cause for a great demonstration on the part of the Socialists and Communists against the Ramek government. A huge demonstration was held in Vienna, which displayed banners attacking the government and calling "Down with the Ramek government." On June 26 Herr Rintelen, ex-governor of Styria, was appointed to the post left vacant by Dr. Schneider's resignation. He was bitterly opposed by the Socialists, who left parliament in a body when his name was proposed. They opposed him because of his anti-Socialist activities and because he was mixed up in the financial scandal in Hungary in 1922.

**END OF LEAGUE OF NATIONS CONTROL.** On June 30, 1923, the control over the finances of Austria by the League of Nations terminated. The work of Dr. Zimmerman was done. The consensus of opinion in all quarters, except that of the Social Democrats, was that Dr. Zimmerman had done an exceptionally good job. The Social Democrats claimed that it was entirely due to their opposition that the financial adviser had failed to put across his pet scheme of a

bourgeoisie control, which was expected and looked for by the Austrian business men. Dr. Zimmerman in commenting on the attitude and statements of the Social Democrats stated that they were only a minority group, although he was forced to fight them for every improvement he made in Austrian financial conditions.

**ATTACKS ON THE RAMEK CABINET.** On August 31, the Ramek government averted a serious crisis when a bill to impeach it was defeated by a strict party vote. The occasion for the introduction of the impeachment proceedings was the loan of \$9,000,000 made by the government to the Central Bank der Deutscher Sparkassen. This bank was very prominent in the old days of the Dual monarchy and acted as a clearing house for many of the provincial banks of the Empire. After the war the tremendous reduction in the territory of Austria compelled it to move to Vienna from Prague, and to engage in ordinary banking business. In June the bank was threatened with a run of depositors and the government loaned it the above mentioned sum to tide it over its difficulties. The Socialists bitterly attacked the Ramek government for taking this step without consulting parliament in advance. The premier defended himself by stating that there was not time to consult parliament at the moment; he did consult parliament as soon after the fact as he could; and that he expected to get the money back by a tax on all savings banks. A parliamentary investigation of the affair seriously weakened the position of the Ramek government, by showing that he and his party were involved politically and had not acted from purely unselfish motives. The investigation brought out the fact that when the government loaned the bank the money its liabilities exceeded its assets by more than \$14,000,000.

Chiefly because of this bank wrangle, the Ramek government was compelled to resign on October 15. The immediate cause of the resignation was the failure of the government and the state employees to agree on the question of an increase in wages. On October 20 a new cabinet was formed under the leadership of Dr. Seipel. It was constructed as follows: Chancellor, Foreign Affairs, and Interior, Dr. Seipel; Vice-Chancellor and Justice, Dr. Franz Dinghofer; Education, Richard Schmitze; Social Welfare, Dr. Josef Resch; Finance, Dr. Victor Kienbock; Agriculture and Forestry, Andreas Thaler; Trade and Transportation, Dr. Hans Schuerff; Defense, Karl Vaugoin. Resch, Thaler, Schuerff, and Vaugoin were retained from the preceding cabinet. The new cabinet relied for its support on the same group as had the Ramek cabinet—the Christian Socialists and the Pan German Party. The chief difference lay in the fact that Dr. Seipel was backed by the Christian Socialists of the City of Vienna rather than by the country districts as Ramek had been. Dr. Seipel in his opening remarks to parliament stated that he would first attack the difficulties that existed between the government and the state employees and the bankers. Afterwards he would take up the problem of the trade difficulties under which the republic was suffering. During December Dr. Seipel was attacked in several quarters because of his evident coldness to a union with Germany and his apparent friendliness with Mussolini. The Socialists ac-

cused him of turning away from Germany and leaning toward Italy because of his religion, Roman Catholicism, which would not mix with German Protestantism but would mix with Italian Catholicism.

**AUTHORS' LEAGUE OF AMERICA.** A national organization of authors, artists, dramatists, and screen writers, founded and incorporated in 1912, for the purpose of procuring adequate copyright legislation, both international and domestic; protecting the rights and property of all those who create copyrightable material; advising all such in the disposal of their productions and obtaining for them prompt remuneration therefor; disseminating information among them as to their just rights and remedies. The League supplies confidential information relating to publishers, theatrical and motion picture producers, art buyers, and other persons and companies engaged in the purchase, sale, publication, or production of copyrightable material. The League is divided into four departments or guilds, the American Dramatists, the Authors' Guild, the Guild of Free Lance Artists, and the Screen Writers' Guild. The headquarters of the League are at 2 East 23d Street, New York. Officers in 1926 were: president, George Barr McCutcheon; vice-president, Owen Davis; secretary and treasurer, Luise Sillcox; editor, Henry Gallup Paine.

**AUTOMOBILE INSURANCE.** See INSURANCE.

**AUTOMOBILE RACING.** This sport had the distinction of drawing the largest single crowd of the year 1926 to a sporting event, when, on May 31, some 150,000 persons witnessed the annual 500-mile race over the Indianapolis Speedway. It rained so heavily during the contest that at the end of the 175th mile the pilots were called from the track. The race was resumed later, Frank Lochart of Los Angeles being the winner.

The championship for the year was won by Harry Hartz, also of Los Angeles, who had finished second to Lochart in the Indianapolis classic. Hartz was the victor in a 120-mile race at Speedway, N. J., where he established a world record for motors of the ninety-one cubic inch displacement type. At the same place and on the same day he also won a 60-mile race. Later in the year he finished first in the 200-mile race on the Rockingham Speedway and captured the 300-mile contest at Atlantic City. Bennett Hill established new 5-mile and 10-mile records at Charlotte, N. C. in November.

Six well-known drivers were numbered among the fatalities suffered in this sport during the year. They were J. A. Walker, Jack Foley, Elmer Davis, Nick Guglielmo, Benjamin Lawder and Louis Fink.

**AUTOMOBILES.** In 1926 the American automobile industry, for the 29th time in its history, enjoyed a record year, with production, value, and registration in excess of the corresponding figures for 1925. In this connection it is interesting to note that only three times in its history has the American motor industry failed to reach a new high total; one was in the war year, 1918, another in 1921, and the third in 1924. The National Automobile Chamber of Commerce at the end of the year estimated the production of motor vehicles for 1926 as 4,480,000, with a wholesale value of \$3,056,950,000, as compared with 4,336,754 motor vehicles in

1925, with a wholesale value of \$2,977,904,833. Likewise, there was an increase of 3 per cent in the number of motor vehicles exported from the United States and Canada in 1926 over 1925, the estimate for the year being 550,000, valued at \$475,000,000, or 12 per cent of the motor vehicles manufactured being sent abroad. Only 820 motor vehicles were imported into the United States during the year. The export business in motor vehicles and accessories not only had reached large dimensions, but it was believed that within a few years 25 per cent of the American production would be sold abroad.

Of the total number of vehicles already referred to, 3,950,000 were cars, valued at wholesale at \$2,622,450,000, and 530,000 were trucks, valued at wholesale at \$434,500,000, making a total wholesale value of cars and trucks of \$3,056,950,000. Of the cars produced during the year 2,926,000, or 74 per cent, were closed cars. The tire production of the year amounted to 63,000,000, and the wholesale value of motor vehicle tires for replacement was \$775,000,000. The wholesale value of parts and accessories for replacement produced during the year was estimated at \$600,000,000. The average retail price of a motor car in 1926 was \$886, while the average retail price of a truck was \$1090.

The importance of the motor industry was indicated by the fact that 3,500,000 persons were employed in connection with motor vehicles and allied lines. Motor vehicle taxes in 1926 amounted to \$735,226,000, which was close to the total expenditure for highway construction and maintenance during the year. Automobiles and motor products contributed to the total railway shipments an aggregate of 3,160,000 freight car loads, which was a new high record. The world registration of motor vehicles was estimated at 27,500,000, of which there were registered in the United States 22,330,000, or 81 per cent. Of these, 19,520,000 were motor cars and 2,810,000 were motor trucks. On the farms of the United States 4,852,000 motor vehicles were registered, and of 3,001,825 miles of highway, 560,000 miles were surfaced.

The statistics of the National Automobile Chamber of Commerce were further interesting as affording information on retail financing. It was estimated that in 1926, 64 per cent of the new cars were sold on time, and that there was outstanding automobile time paper to the amount of \$1,378,000,000—the average note, at the time of purchase, for new cars being \$505, and in the case of used cars, being \$277. The automobile industry uses 83 per cent of the rubber imported into the United States and 50 per cent of the plate glass produced. It also uses 12 per cent of the copper and 12 per cent of the iron and steel. In 1926, 8,650,000,000 gallons of gasoline were consumed and 560,000,000 gallons of motor oil. In 1926 the crude rubber used in tires aggregated 712,981,000 pounds, and the cotton fabric 227,512,000 pounds.

The motor bus and motor truck continued to increase in use, there being 80,000 buses in 1926 and 15,000 new buses manufactured. Consolidated schools to the number of 15,332 were using motor transportation, and 344 street railway companies were using motor buses. Seven thousand buses in all were used by street railways and 510 by 41 steam railroads. Railroads using gasoline rail motor coaches for short lines numbered 190, and 60 railroads were using motor trucks as

part of their shipping service. In 1926 it was estimated that there were 53,360 car and truck dealers, and 51,715 public garages, 83,758 service stations and repair shops, and 66,584 supply stores.

**AVIATION.** See **AERONAUTICS.**

**AVIATION, NAVAL.** See **VESSELS, NAVAL**, and **NAVAL AVIATION**; **NAVAL PROGRESS** (Remarks on aviation under the head of each nation).

**AZERBAIJAN**, a'zër-bi-jan'. A new state constituted in 1918, consisting chiefly of the two former Russian provinces of Baku and Yelisavetpol; bounded on the east by the Caspian Sea, on the west by Georgia and Armenia, on the south by Persia, and on the north by Georgia, Northern Caucasus, and Daghestan. The official name of the state is the Azerbaijan Socialist Soviet Republic. Area about 33,970 square miles and the population, according to official Russian figures, about 2,096,973, of whom 75 per cent are Moslem. Baku, the centre of the petroleum industry, is the capital and has a population of approximately 250,000. In 1924 there were 1303 schools with 129,000 pupils; also 60 trade-technical schools; 11 teachers' training centres, 3 higher educational institutions, and 6 workers' faculties. The oil industry, which before the war produced almost 10,000,000 tons of oil annually has suffered a severe relapse, probably due to the gradual exhaustion of the wells. In 1924 the production was estimated at only 4,200,000 tons. After the outbreak of the Russian Revolution in 1917, Azerbaijan, Armenia, and Georgia formed a federation, but this broke up after a few weeks, when the three constituent elements each declared its independence. Two months after the *de facto* independence of Azerbaijan was recognized by Great Britain in 1920, the Bolsheviks overthrew the government and thenceforth the government was under Soviet control.

**BADEN**, bi'den. A constituent state of the German Republic, with a republican form of government since Nov. 22, 1918; formerly a grand duchy in the German Empire; bounded by Bavaria on the east and Alsace-Lorraine and the Palatinate on the west. Area, 5819 square miles; population in 1925, 2,312,462, as compared with 2,195,580 in 1919. Capital, Karlsruhe, with 145,694 inhabitants in 1925. The largest city is Mannheim with 247,486 inhabitants in 1925. Of the total population of the state in 1925, 1,115,477 were males and 1,196,985 females. The majority of the population is Roman Catholic. Education is free, general, and compulsory, the schools being under the jurisdiction of the state. For higher education there are universities at Heidelberg and Freiburg. In 1925 the total area under cultivation was 1,998,180 acres. Among the agricultural products, oats, rye, barley, wheat, potatoes, and vegetables are the most important; 36,492 acres were planted to the vine in 1924 and the yield of wine was 7,688,298 gallons. In 1925, 10,982 acres were under tobacco. In 1924 there were 627,697 cattle, 425,296 pigs, 64,120 sheep, 178,491 goats, 67,708 horses. The budget for 1925-26 fixed the ordinary revenue at 201,870,000 gold marks and the ordinary expenditure at 198,740,000 gold marks.

The present constitution dates from Mar. 21, 1919, and vests the executive power in a cabinet comprising the state president, five ministers,

and three state councilors without portfolios, all of whom are elected by the legislature. Legislative power resides in a single chamber body known as the Landtag. The constitution abolishes all privileges of birth and religion and under it women are endowed with the same rights as the men, bring eligible to all public offices. There is universal suffrage for all persons of either sex over 20 years of age. The initiative, referendum, and proportional representation have been introduced. The Landtag, elected on Oct. 25, 1925, for the term ending Oct. 25, 1929, had 72 members distributed among the several parties at the beginning of 1926 as follows: Centre, 28; Socialists, 16; German Democratic Party, 6; Right, 9; German People's Party, 7; Communists, 4; Economic Union, 2. State president at the beginning of 1926, G. Trunk, who also held the post of Minister of Justice. H. Köhler was Minister of Finance and A. Remmele Minister of the Interior and Education.

**BAHA'MAS.** A group of islands north of the British West Indies, off the southeast coast of Florida, 29 in number, of which 20 are inhabited. They also include 661 keys and over 3000 reefs. The islands, which are of coral formation, have an area of 4404 square miles and a population, according to the census of 1921, of 53,031. The estimated population on Jan. 1, 1925, was 55,423. The important islands with their populations in 1921, are as follows: New Providence, containing the capital, Nassau, 12,975; Andros, 6976; Eleuthera, 6048; Long Island, 4659; Abaco, 3993; Exuma, 3730; St. Salvador, 4273. In 1924 the movement of population was: Births, 1640; deaths, 1310. Elementary instruction is compulsory from the ages of 6 to 14. In 1924 there were in the government schools, 6663 pupils; in aided schools, 3011; schools supported by the Church of England, 693 pupils; supported by the Roman Catholics, 464 pupils. For the calendar year 1924, the exports totaled £626,353, and the imports, £1,553,143. The principal exports were sisal, sponge, lumber, tomatoes, shells, and preserved pineapples; principal imports, foodstuffs, spirits, raw materials, and manufactured articles. In 1924-25 the revenue was £420,077 and the expenditure, £415,577. The public debt in 1925 was £17,861. Ship entries in 1924, 1258 vessels of 624,205 tons (440 British of 250,199 tons); clearances, 1267 vessels of 629,112 tons (470 British of 254,689 tons). The islands are administered by a governor who is assisted by an executive council and a legislative council, each of nine members and a legislative assembly of 29 members, the franchise being based on a small property qualification. Governor and Commander-in-chief at the beginning of 1926, Sir H. E. S. Cordeaux, who was succeeded later in the year by Maj. Charles William Orr, who had been Colonial Secretary of Gibraltar. During July the Bahamas were visited by a severe storm which caused severe suffering and considerable loss of life on practically all the islands. It is estimated that in the neighborhood of 200 persons were killed.

**BAKU.** See **AZERBAIJAN.**

**BALKAN STATES.** The collective term applied to those states which make up the Balkan peninsula in southeastern Europe west of the Aegean Sea. See **ALBANIA**, **BULGARIA**, **GREECE**, **JUGOSLAVIA**, **RUMANIA**, and **TURKEY**.

**BALTIC PROVINCES.** (Now **BALTIC STATES**). The name formerly applied to the Russian provinces of Courland, Esthonia, and Livonia, held by Germany for a time during the war and relinquished at the end of 1919. They now comprise the two new republics: Esthonia, formed out of the province of the same name and the northern part of Livonia; and Latvia, formed out of Courland and the southern part of Livonia. See **ESTHONIA** and **LATVIA**.

**BANCROFT, SIR SQUIRE.** English actor-manager, died in London, April 19. He was born in London, May 14, 1841, and was educated in private schools in England and France. His first appearance on the stage was in 1861 at the Theatre Royal in Birmingham, a reversal of family fortunes making necessary his securing remunerative employment at that time. For four years he was engaged with various companies in the provinces, playing at theatres in Dublin, Cork, Birmingham, and Liverpool, and in 1865 he became a member of the company, at the Prince of Wales Theatre, formed by Miss Marie Wilton and H. J. Byron, appearing in *A Winning Hazard*. In 1867 he married Miss Wilton and became a manager, acting in various comedies at the Prince of Wales Theatre which were remarkably successful. Among his rôles played in the Robertson comedies were, Sidney Daryl, and, later Tom Stylus, Angus MacAlister and later Hugh Chalcot in *Ours*; Captain Hawtree in *Caste*; and Chevalier Browne in *Play*; Jack Poyntz in *School*; and Talbot Piers in *M.P.* He also played Joseph Surface in *The School for Scandal*; Orloff in *Diplomacy*; Loris Ipanoff in *Fedora*; and Triplet in *Masks and Faces*. Bancroft and his wife instituted many reforms at the Prince of Wales Theatre, and raised the standard of acting and production in many important respects. They introduced to London such actors as Sir John Hare, Kyrle Bellew, and William Terriss. The theatre proved increasingly profitable and enjoyed popular support and in 1880 Bancroft moved from the Prince of Wales to the Haymarket. In 1885 he and his wife retired from management, and subsequently acted with Irving in the revival of *The Dead Heart* at the Lyceum in 1889, and with Sir John Hare in *Diplomacy* at the Garrick in 1893. In 1897 he was knighted in recognition of his "notable services to his profession," and he served as president of the Actors' Association, and in a number of theatrical and other charities. He was a man of great culture, and his influence on the English stage was second to none. He had visited America in 1859 and again in 1868. He was a joint author, with his wife, of *On and Off the Stage*, 1888; and author of the *Bancroft Recollections of Sixty Years*, 1909.

**BANKERS ASSOCIATION, AMERICAN.** The dominant national organization of banks in the United States. It has a membership of over 21,000 banks, out of a total of 28,000 banks in the country, and comprises among its members an estimated 90 per cent of the nation's aggregate banking capital funds of \$7,800,000,000 and total resources of \$65,000,000,000. The Association has four major divisions, each devoted to the special interests, technical advancement and general welfare of the respective classes of banks indicated in their titles, as follows: the National Bank Division, the Savings Bank Division, the State Bank Division, and the Trust Company Division. Within the organization there are also

three sections devoted to general inter-bank interests as follows: the American Institute of Banking Section, which is the educational arm of the organization, with an enrollment of 35,000 students from banks in all parts of the country and a general membership of 57,000; the Clearing House Section, which promotes the organization of city and county bank groups for the purpose of facilitating business transactions and common welfare through clearing houses, clearing house examiner systems, and mutual credit bureaus; and the State Secretaries Section, which forms a link between the national organization and the state bank associations that exist in every state. There is also a Protective Department which prosecutes continually a country-wide campaign of prevention, protection, and investigation for all member banks, in respect to criminal operations against banks. The Association conducts, also, a Legal Department, which keeps bankers informed on developments in the field of banking law and watches the interests of banking and the public in both state and national legislation, in connection with the State and Federal Legislative Committees and Councils of the Association, which seek to present the best banking viewpoints to the legislators.

In commemoration of its fiftieth anniversary, the Association founded the American Bankers Association Educational Foundation, to gather a fund of \$500,000 to be employed in furtherance of scholarships and research in banking and finance in colleges. The organization, through its Public Relations Commission, conducts nationwide activities in behalf of better common understanding regarding banking and its activities through the press, and also, through its Public Education Commission, conducts lectures on banking and business in schools and civic clubs throughout the country. Its Commerce and Marine Commission conducts, and makes public, researches in regard to transportation and international commerce of the United States; the Economic Policy Commission devotes its activity to subjects of general economic concern, such as the Federal Reserve System, installment selling, and other topics; the Agricultural Commission devotes itself to investigating the relations between bankers and farmers and to promoting better farm economics and rural financial conditions.

In addition, the Association supports a number of specialized committees for special investigations and activities. Throughout its career it has stood for and vigorously promoted sound currency, banking, and business policies, and from time to time has exerted itself in behalf of specific economic matters making for the welfare not only of banking, but of the nation as a whole.

During 1926 the most important action in respect to legislation was the endorsement in annual convention and activity in furtherance of the McFadden Bill without the Hull Amendments, a measure aimed to modernize the national bank law and to equalize the privileges of national banks with those of state chartered banks, to recharter the Federal Reserve Banks for an indeterminate period, and to restrict branch banking within the Federal Reserve System on conditions equitable with such branch banking privileges as are enjoyed by state banks. In the fall of the year the Association holds its annual convention, which, as the supreme

authority, draws up the organization's policies. In the spring it holds a meeting of its Executive Council, a representative body proportioned to the membership in all the states, and qualified to take action upon certain Association matters.

The continuing activities of the Association are carried on by a permanent staff functioning in the national headquarters of the organization at 110 East 42d Street, New York City, under the direction of the Executive Manager, Fred N. Shepherd. The officers for 1926 were: president, Melvin A. Taylor, President First Trust and Savings Bank, Chicago; first vice-president, Thomas R. Preston, President Hamilton National Bank, Chattanooga, Tenn.; second vice-president, Craig B. Hazlewood, vice-president Union Trust Company, Chicago; treasurer, Nathan D. Prince, president Hartford-Connecticut Trust Company, Hartford, Conn. There is also an Administrative Committee, composed of fifteen members including the national officers, heads of the various divisions and sections, and certain others, which stands as the ad interim governing authority between meetings of the convention and the Executive Council.

**BANKS AND BANKING.** See FINANCIAL REVIEW; NATIONAL BANKS.

**BAPTISTS.** In 1926 there were in the United States 14 bodies comprising that branch of the Christian Church known as Baptists, which numerically constituted the second largest Protestant group. While the Baptists trace their origin to the Protestant Reformation in the sixteenth century and churches were found in that period in Germany and Switzerland, the first Calvinistic Baptist Church was formed in London in 1638 and the first Baptist church in America was probably established by Roger Williams in Providence, R. I., in 1639, although this honor is disputed by the First Baptist Church of Newport, R. I., organized the same year or shortly after. As a result of political differences, and particularly on account of the question of slavery prior to the Civil War, the Southern Baptists withdrew from the national organization in 1845, forming the Southern Baptists Convention, which, since that time has functioned not as a new denomination, but as an organization for the purpose of directing missionary and general evangelistic work in the churches of the Southern States. A National Baptist conference representing the negro churches was also formed. In addition to the main body, other divisions early began to appear. These were known as "Primitive," "United," "General," "Free," etc. In its polity the church is congregational, each church being sovereign as to its own discipline and worship. Applicants for the ministry are licensed to preach by the church in which they hold membership.

Statistics prepared by the *American Baptist Year Book* in 1926 showed in the United States a total of 57,215 churches, with 48,793 ordained ministers; 2168 local associations; and 355,152 baptisms during the year, making a membership of 8,327,202. Sunday schools numbered 47,151, with an enrollment of 5,105,411. Church property was valued at \$391,981,700, and contributions amounted to \$74,810,831, of which \$59,445,872 was for current expenses and \$15,364,959 for benefices. These figures were divided among the three main groups of the denomination as follows: The Northern Baptist Convention, composed of 38 State conventions, reported 8393

churches; 425 associations; 9073 ministers; 72,165 baptisms during the year; 1,381,600 church members; 7386 Sunday schools with a membership of 1,338,202; and contributions amounting to \$3,612,990. The Southern Baptist Convention consisted of 18 State conventions, and had 26,435 churches; 986 associations; 19,808 ministers; 3,648,516 members, of whom 224,191 were baptized during the year; 21,760 Sunday schools, with 2,692,860 members; and a contribution of \$39,049,488. There were 26 Negro Baptist Conventions with 22,412 churches; 758 associations; 20,050 ministers; 3,310,969 church members, 59,370 of whom were additions; 1,088,986 Sunday school scholars in 18,032 schools; and \$4,548,765 in contributions.

In the Dominion of Canada there were three conventions; churches numbered 1287; ministers 804; members 141,027, 6237 being additions; 1156 Sunday schools, and 111,274 scholars; and contributions to the amount of \$2,991,367. There were 87 churches in Mexico, with 52 ministers and 6293 members.

The denomination maintains in the United States and Canada 248 educational institutions, which in 1926 had 83,397 students, 5188 instructors, property and endowments valued at \$92,388,000, and an income for the year of \$20,574,123. Of these institutions, the Northern Baptists maintained 62, the Southern Baptists 120, the Colored Baptists 61, and 8 were in the Dominion of Canada. There were 33 orphanages, 23 homes, and 35 hospitals under the direction of the denomination. Large staffs of workers were engaged in home missions and in foreign missions in India, Burma, China, Japan, the Congo, the Philippines, and European countries.

In addition to several unorganized groups of foreign-speaking Baptists in North America, there are the following organized bodies which hold their own conferences: German, Swedish, French-speaking Baptists of New England, Finnish Baptist Mission Union, American Magyar (Hungarian), Italian, Danish, Norwegian, Czechoslovak, Polish, Rumanian Baptist Association, Portuguese Baptist, and Russian Baptist Conferences. Statistics for these bodies in 1926 were as follows: Churches, 909; ministers, 714; baptisms, 4183; membership, 81,054; Bible schools, 895; Bible School enrollment, 84,788; property valuation, \$10,069,900; contributions, \$2,193,316.

Smaller branches of the denomination, differing in various respects from the main branches of the church, include the following: Six-Principle Baptists (The International Old Baptist Union), Seventh-Day Baptists, Free Will Baptists, Colored Free Will Baptists, Free Will Baptists (Bullockites), General Baptists, Separate Baptists, Regular Baptists, United Baptists, Duck River Primitive Baptists (Progressive), Scandinavian Independent Baptists, and Two-Seed-In-The-Spirit Predestinarian Baptists. See also BAPTISTS, FREE.

The denomination maintains several publishing houses, of which the most important is the American Baptist Publication Society in Philadelphia. The official periodical of the Northern Baptist Convention is *The Baptist* (Chicago); of the National Baptist Convention, the *National Baptist Voice* (Nashville); while many sectional publications represent the Southern Baptist Convention.

The Baptist World Alliance was organized in 1905 and meets every five years; the last meet-

ing was held in July, 1923, in Stockholm, Sweden. Its relationship to the Baptist churches is purely advisory and its purpose is discussion of interests common to the denomination. The *British Baptist Hand Book* for 1924 prepared the following statistics of the denomination in 1925:

	<i>Churches</i>	<i>Ministers</i>	<i>Members</i>
America .....	60,484	49,419	8,254,778
Europe .....	12,883	4,661	1,626,188
Asia .....	3,188	1,837	812,260
Africa .....	562	251	50,888
Australasia .....	449	350	32,065
Total .....	77,566	56,519	10,276,179

**BAPTISTS, FREE.** A branch of the Baptist denomination, which by 1926 had practically completed its policy of merging with the Northern Baptist Convention. During the year there was but little independent activity of the Free Baptists, yet the General Conference of Free Baptists, the national incorporated organization, still preserved its legal existence and powers. Estates in which life interests terminated or other entailments were removed, were still coming to its treasury. The majority of Free Baptist ministers, churches, and members were included in the enumeration of the Northern Baptist Convention. Alfred Williams Anthony was serving as corresponding secretary and treasurer. See BAPTISTS.

**BAR ASSOCIATION, AMERICAN.** A national association organized in 1878 to advance the science of jurisprudence, the administration of justice, harmony in legislation, and the observance of legal precedents throughout the United States, as well as to uphold the legal profession and promote good understanding among its members. The forty-ninth annual convention, held at Denver, Colo. July 14-16, 1926, in connection with those of the National and International Associations of Attorneys-General, was attended by 2109 delegates. The retiring president, Chester I. Long, speaking on the "Advance of the American Bar," summarized the work of the Association throughout the years of its existence, as well as American judicial development during that period, and emphasized the necessity for the Association to oppose the tendency of the National government to destroy the liberty of State governments, thus destroying the liberty of the people. Roscoe Pound, dean of Harvard Law School, chose as his subject "The Canons of Procedural Reform," suggesting several needed reforms in legal procedure, the most important of which was that in cases of appeals to a higher court from a lower, the appeal should be taken not as to a separate court, but as to another branch of the same court. Other speakers were Robert G. Dodge of Boston, on "The Judicial Council," who made the statement that one of the greatest lacks of United States judicial procedure was an officer or board charged with the responsibility of studying and determining the needs of the courts; and Edson R. Sunderland of Ann Arbor, Mich., on "Exercise of the Rule-Making Power," regretting the tendency toward centralization of power in the United States. The convention adopted a resolution expressing its desire to cooperate with the Veterans' Bureau in caring for the right of so-called "orphans" cases." It endorsed the action of Kansas, Illinois, West Virginia, and Ohio in raising the standard of

requirement for admission to the bar, and urge closer cooperation between its members and the press. The taking of testimony to fix the responsibility for alleged derelictions of the American judiciary was begun. Reports of committee adopted without opposition were those of the Committees on Revision of Federal Statutes Admiralty and Maritime Law, Change of Date of the Presidential Election, Legal Aid, Aeronautics, Insurance, and the Incorporation of the American Bar Association. Officers elected at the convention were: Charles S. Whitman, New York, president; Frederick E. Wadhams of Albany, re-elected treasurer for the 26th consecutive time; and William P. McCracken, Chicago, secretary. Frederick E. Wadhams died September 5, 1926, and Edward Kaestner Albany, was appointed acting treasurer. Headquarters of the Association are 1119 The Rookery, 209 So. LaSalle St., Chicago, Illinois.

**BARBADOS.** An island colony of Great Britain, lying to the east of the Windward Islands; the most westerly of the Caribbean Islands. The area is 166 square miles and the population, according to the census of 1921, 156,312; estimated, Dec. 31, 1924, 159,499. The capital and chief city is Bridgetown, with a population of 13,486. In 1924 the average attendance in the elementary schools was 13,676 out of an enrollment of 21,729. In 1924 there were 5227 births and 4692 deaths. The figures in pounds sterling for revenue, expenditure, imports and exports, and public debt for 1924-25 were as follows:

Revenue .....	£504,696
Expenditure .....	365,531
Imports .....	2,556,297
Exports .....	1,858,301
Public debt .....	591,000

The principal imports were cotton manufactures, manures, flour, dried fish, machinery, salt beef and pork, and rice. The principal exports were sugar, molasses, raw cotton, and rum. The administration is under a governor assisted by an executive council, an executive committee, a legislative council of nine members appointed by the king, and an assembly of 24 members elected annually by the people. Governor at the beginning of 1926, W. C. F. Robertson.

**BARLEY.** The world's barley production in 1926, exclusive of the Soviet Republics for which data for the year were not available, but which produced 239,628,000 bushels in 1925, was over 11% above the average production for the five years 1920 to 1924, but was over 5% below the production in 1925 although the acreage was practically the same according to estimates reported by the International Institute of Agriculture at Rome. The total production of the countries reporting estimates amounted to 1,106,100-900 bushels in 1926 and to 1,168,130,000 bushels in 1925 while for the five years 1920 to 1924 it was 994,778,100 bushels. The leading barley-producing countries and their yields were reported as follows: Germany 120,353,600 bushels, Canada 105,086,000 bushels, Spain 95,021,000 bushels, Roumania 77,390,600 bushels, Japan 77,177,900 bushels, Poland 73,750,800 bushels, France 54,016,500 bushels and Czechoslovakia 51,335,200 bushels. Of these countries France reported an increase of 14.5% and Roumania of 65.3% over the production of the preceding year.

In South America, Argentina in the crop year 1925-26 produced 17,054,800 bushels and Chile 5,294,000 bushels.

The United States, as estimated by the Department of Agriculture, produced in 1926 191,182,000 bushels on 8,200,000 acres, or at the rate of 23.3 bushels per acre as compared with a crop of 216,554,000 bushels on 8,088,000 acres, the rate being 26.8 bushels per acre, in 1925. The average farm price Dec. 1, 1926, was 57.4 cents per bushel as against 58.9 cents on the corresponding date the year before, making the total value of the crops \$109,677,000 and \$127,453,000 respectively. The yields of the leading barley-producing States were reported as follows: Minnesota 32,675,000 bushels, California 32,400,000 bushels, North Dakota 21,050,000 bushels, Wisconsin 17,974,000 bushels and Illinois 12,710,000 bushels. North Dakota led in area with 1,472,000 acres, with Minnesota standing next with 1,307,000 acres, these being the only States with more than a million acres. The average farm price December 1, 1926, in the different States ranged from 46 cents in North Dakota to \$1 per bushel in North Carolina. During the year ended June 30, 1926, the United States exported 27,182,000 bushels of barley, or 3,529,000 bushels more than during the preceding fiscal year. Official barley standards divided into classes on the basis of the section where grown, to adapt them to the grain produced under the different conditions obtaining in the Middle West as compared with the Pacific Coast area, were established after public hearings on the subject were held, and became effective Aug. 24, 1926.

**BARNARD COLLEGE.** See COLUMBIA UNIVERSITY.

**BASEBALL.** Professional baseball retained its grip on the American sport-loving public in 1926 when all past attendance records were eclipsed. The National League, profiting through an unusually exciting pennant race, reported a total paid attendance at its games of 4,950,000 and there is no reason to doubt but that the American League at least held its own in this regard although no official figures were published. The world series contested between the St. Louis Cardinals of the National League and the New York Yankees of the American League shattered all marks both for attendance and receipts. The seven games constituting the series attracted 328,051 persons who paid \$1,207,864 through the turnstiles. The prosperity of baseball was emphasized in the reelection of Judge Kenesaw Mountain Landis as Commissioner for a seven-year term at a salary increase of \$15,000, making his annual stipend, \$65,000.

The winning of the National League pennant by the St. Louis Cardinals was especially welcome to a large majority of fans inasmuch as it marked the first flag triumph for a St. Louis team since 1888. The Cardinals' victory came only after a most closely contested race in which the Cincinnati Reds and the Pittsburgh Pirates were contenders until within a few days of the close of the season. The New York Yankees also had a hard struggle, winning out over the Cleveland Indians by a margin of only three games.

The statistics of the world series which was won by the Cardinals, four games to three, follow:

First game, Yankees, two runs, six hits, one error; Cardinals, one run, three hits, one error. Batteries,

Pennock and Severoid; Sherdal, Haines and O'Farrell.

Second game, Cardinals, six runs, twelve hits, one error; Yankees, two runs, four hits, no errors. Batteries, Alexander and O'Farrell; Shocker, Shawkey, Jones and Severoid, Collins.

Third game, Cardinals, four runs, eight hits, no errors; Yankees, no runs, five hits, one error. Batteries, Haines and O'Farrell; Ruether, Shawkey, Thomas and Severoid.

Fourth game, Yankees, ten runs, fourteen hits, one error; Cardinals, five runs, fourteen hits, no errors. Batteries, Hoyt and Severoid; Rhem, Rheinhardt, H. Bell, Hallahan, Keen and O'Farrell.

Fifth game, Yankees, three runs, nine hits, one error; Cardinals, two runs, seven hits, one error. Batteries, Pennock and Severoid; Sherdal and O'Farrell.

Sixth game, Cardinals, ten runs, thirteen hits, two errors, Yankees, two runs, eight hits, one error. Batteries, Alexander and O'Farrell; Pennock and Severoid.

Seventh game, Cardinals, three runs, eight hits, no errors; Yankees, two runs, eight hits, three errors. Batteries, Haines, Alexander and O'Farrell; Hoyt, Pennock and Severoid.

The two outstanding players of the series were Grover Cleveland Alexander, veteran pitcher of the Cardinals, and George Herman (Babe) Ruth, the mighty slugger of the Yankees. Alexander's steady pitching was largely responsible for the winning of the second and sixth games by St. Louis and in the seventh and decisive contest Alexander went to the mound with the bases full and retired the Yankees without a run. He then held the opposing batters in check for the remainder of the game. In the fourth battle Ruth broke loose in a batting orgy with three home runs, breaking all records for homers in a single game—total bases, extra bases on long hits and other items.

George Burns, the Cleveland first baseman, was voted the most valuable player in the American League while in the National this honor went to Robert O'Farrell, St. Louis catcher. The leading pitchers of the year were Ray Kremer of the Pittsburgh Pirates and George Uhle of the Cleveland Indians. Charles Hargrave of the Cincinnati Reds and Henry Manush of the Detroit Tigers were the leading batsmen.

Followers of baseball received a double shock in December, the first being testimony given out by Commissioner Landis to the effect that Tyrus Raymond Cobb, Tristram Speaker and Joseph Wood were involved in a plot to "throw" a game on Sept. 25, 1919, and the second the charges of Charles A. (Swede) Risberg, one of the players expelled from baseball in connection with the world series scandal of 1919, that several players including Ray Schalk and Edward Collins had contributed to a purse which was turned over to certain Detroit players in 1919 as a reward for their "sloughing" a series of games between the Chicago White Sox and the Detroit Tigers. The White Sox at the time were having a close race with the New York Yankees for third place money. Commissioner Landis after a hearing at Chicago announced that he would render a decision in the Risberg case on Jan. 12, 1927. As for the charges against Cobb, Speaker and Wood the Commissioner declared that inasmuch as all three of these players were out of baseball he did not feel it necessary to take any action.

The biggest trade in the history of baseball since the acquisition of Babe Ruth from the Boston Red Sox by the New York Yankees took place in December when Captain Frank Frisch of the New York Giants and James Ring, pitcher, were traded to the St. Louis Cardinals for Manager Rogers Hornsby.

The final standing of the clubs in the National

League was: St. Louis won 89, lost 65; Cincinnati won 87, lost 67; Pittsburgh won 84, lost 69; Chicago won 82, lost 72; New York won 74, lost 77; Brooklyn won 71, lost 82; Boston won 66, lost 86; Philadelphia won 58, lost 93.

The final standing in the American League was: New York won 91, lost 63; Cleveland won 88, lost 66; Philadelphia won 83, lost 67; Washington won 81, lost 69; Chicago won 81, lost 72; Detroit won 79, lost 75; St. Louis won 62, lost 92; Boston won 46, lost 107.

The pennant winners in the more important minor leagues were: International, Toronto; Pacific Coast, Los Angeles; American Association, Louisville; Southern, New Orleans; Texas, Dallas; Eastern, Providence; Western, Des Moines. Holy Cross, Fordham, Georgetown and New York University all had high class nines.

**BASKETBALL.** This indoor sport thrived amazingly during 1926, when it was estimated by officials governing the game that close to 15,000,000 persons took part in the various contests throughout the United States. The problem appeared to be to provide sufficient seating facilities for the constantly growing number of spectators. This was particularly true in the college world. Columbia University won the championship of the Eastern Intercollegiate League with a record of nine victories and one defeat. Dartmouth finished second with six games won and four lost. Princeton, Pennsylvania and Cornell tied for third place, winning five games and losing the same number. Yale finished in last place, failing to score a single victory. Indiana, Michigan, Purdue and Iowa tied for first place in the Western Intercollegiate Conference with eight victories and four defeats each.

The annual national tournament of the Amateur Athletic Union was held at Kansas City, championship being won by the Hillyards of St. Joseph, Mo., who defeated the Kansas City A. C. in the final game by a score of 25 to 20. The women's basketball championship of the world was captured by the Newmann-Stern five of Cleveland, Ohio, through the defeat of the Edmonton team of Canada. The American Professional Basketball title went to the Cleveland Rosenblums.

**BATES COLLEGE.** A non-sectarian co-educational college, at Lewiston, Me.; founded in 1864. For the fall term of 1926 there were 642 students, 368 of whom were men and 274 women; in the summer session there was a total of 266, of whom 116 were men. The faculty and administrative officers numbered 46. The year 1926 saw the construction of an addition to the Chemical Laboratory costing \$25,000, and the building of a Physical Education Plant at a cost of \$350,000, three units of which, an indoor athletic field, a men's locker building and a women's locker building, were the gift of a single donor, and the fourth unit, the gymnasium, was provided for by the alumni. A system of honor courses was adopted by the faculty. The permanent funds amounted to \$1,750,000; the total expenditures for the year were \$221,918.04. The budget involved an appropriation of \$257,974.91. The library contained 53,500 volumes. President, Clifton Daggett Gray, Ph.D., LL.D.

**BATESON, WILLIAM.** British biologist, died at Merton, Surrey, February 8. He was born at Whitby in 1861, and was educated at Rugby and

St. John's College, Cambridge where he was Balfour Student, 1887-90. He received the Darwin Medal of the Royal Society in 1904, and in 1908-09 was Professor of Biology at Cambridge University.

He was Fullerian Professor of Physiology at the Royal Institution, 1912-14, and in 1907 he had been Silliman Lecturer at Yale University. He was made director of the John Innes Horticultural Institution at Merton Park, Surrey, 1910, and in 1914 was made president of the British Association for Advancement in Science at its meeting in Australia. He was a member of many learned societies including the National Academy of Science in Washington, and wrote many valuable papers and publications on biological subjects of which the more notable were: *Materials for the Study of Variation*, 1894; *Problems of Genetics*, 1913; *Mendel's Principles of Heredity*, 1920. Had he lived, he would have been president of the Botanical Section of the British Association at its Oxford meeting in August, 1926.

**BATTLE CRUISER.** See VESSELS, NAVAL; NAVAL PROGRESS.

**BATTLESHIPS.** See VESSELS, NAVAL; NAVAL PROGRESS.

**BAUERMEISTER**, bou'ër-mi-stär, MATILDE. A British operatic soprano, died at Herne Bay, Kent, October 15. Although born in Hamburg, in 1849, she spent almost her whole life in England. After graduation from the Royal Academy of Music in London she began her career at Her Majesty's Theatre. In 1885 she sang for the first time in America, during Colonel Mapleson's season at the Academy of Music in New York, and later, during the administration of Maurice Grau, she was a regular member of the Metropolitan Opera Company. In the annals of opera she occupies quite an exceptional position. Lacking a dominating personality and a really remarkable voice, she, nevertheless, achieved distinction in minor rôles and won considerable popularity with her audiences. The full consciousness of her natural shortcomings did not prevent her studying all the principal rôles of the current repertory, not with any hope of ever becoming one of the brilliant stars, but solely for the personal gratification of her artistic instinct. On several occasions, however, she was rewarded, when, in the case of sudden indisposition of the principal artist, she was asked to assume the rôle, thus saving the management the embarrassment of changing the opera. She retired from the stage in 1905.

**BAUMES LAWS.** See CRIME.

**BAUXITE.** In 1925, 316,540 long tons of bauxite, valued at \$1,988,250, were produced in the United States, of which Arkansas contributed 296,320 tons, valued at \$1,878,450. Georgia, Alabama, and Tennessee, with an aggregate production of 20,200 tons, valued at \$109,800, were also producers. The bauxite imported into the United States for consumption in 1925 totaled 353,696 tons, valued at \$1,549,120, while the exports of bauxite, including bauxite concentrates, amounted to 78,633 long tons, which were valued at \$4,134,455.

The production of bauxite in 1926 increased in the United States over that of 1925. The principal source of supply continued to be Arkansas, which shipped bauxite to the alumina plant at East St. Louis. In Alabama the U. S. Bureau of Mines

Experiment Station at Tuscaloosa began an investigation of the possibilities of using low grade bauxite, of which there was considerable in the eastern field. The imports of bauxite came, for the most part from South America, three-quarters of the 1926 imports being from that source. The remainder came from southern Europe, principally Dalmatia. French bauxite production was said to be somewhat larger in 1926 than in 1925, while the Dalmatian output was more than doubled. Large reserves of bauxite in Hungary were being developed during the year to supply the German aluminum industry.

**BAVARIA.** A constituent state of the German Republic; formerly a kingdom within the German Empire, ruled for more than a century by the Wittelsbach dynasty, which was deposed after the revolution following the World War. The new state adopted a republican form of government on Nov. 22, 1918. Area, 29,334 square miles; population, according to the census of 1919, 7,140,340; according to the census of 1925, 7,350,594. Chief cities: Munich, with a population of 680,704 in 1925; Nuremberg, 392,494; Augsburg, 165,522; Ludwigshafen, 101,869. In 1924 there were 46,520 marriages; 167,400 living births; 4569 still births; and 99,958 deaths. The religious division of the population of Dec. 1, 1925, was: Roman Catholics, 5,164,786; Protestants, 2,110,327; Jews, 49,163. Education is compulsory between the ages of six and 16. In 1924 the chief crops with their areas and yields were as follows: Wheat, 643,497 acres, 300,019 metric tons; rye, 965,680 acres, 377,538 tons; oats, 1,103,317 acres, 484,535 tons; potatoes, 926,722 acres, 3,628,941 tons; vines, 50,310 acres, 11,764,896 gallons; hops, 24,982 acres, 4737 tons. The census of livestock in the same year showed 397,236 horses, 3,575,689 cattle, 629,421 sheep, 1,817,730 pigs, and 501,970 goats. No later statistics on mineral production are available than those given in the preceding YEAR BOOK.

The constitution dates from Aug. 14, 1919. Under it, the supreme power is vested in the people, who are represented by a diet of one chamber elected for four years on a basis of universal, equal, direct, secret, and proportional suffrage, all citizens over 21 years of age having the right to vote. There is one representative for every 62,000 inhabitants, making a legislature of 129 members. The various parties represented in the Bavarian National Constituent Assembly (elected April and May, 1924) were as follows: Bavarian People's Party, 46; Social Democrats, 24; Völkischer Bloc, 13; National Socialists, 6; German Nationals and National Liberals, 14; Bavarian Peasants' and Middle-Class Union, 11; Communists, 8; others, 7. The cabinet as constituted at the beginning of 1926 was as follows: Premier and Minister of Foreign Affairs, Dr. Held; Education, Dr. Matt; Commerce and Industry, Dr. von Meinel; Social Welfare, Herr Oswald; Agriculture, Professor Fehr; Interior, Herr Stuetzel; Finance, Dr. Krausneck; Justice, Herr Gürtner.

**BAX, ERNEST BELFORT.** British lawyer and socialist, died in London, England, November 26. He was born at Leamington, July 23, 1854, and was educated privately in London and Germany where he studied music and also philosophy. He was a foreign correspondent in 1880-81; returning to England became one of the founders of the English Socialist Move-

ment. In conjunction with William Morris, he helped to start the Socialist League in 1885, and was associated with him as a co-editor of the weekly journal *Commonweal*. He resigned later from the Socialist League, becoming connected with the Social Democratic party, and was the editor of its organ *Justice*. He was a delegate of the Social Democratic Federation to various international congresses, and was a prolific writer on Socialism. His works included: *Jean-Paul Marat* (1878); *Kant's Prolegomena*, etc., with Biography and Introduction (1882); *Handbook to the History of Philosophy* (1884); *Religion of Socialism* (1886); *Ethics of Socialism* (1889); *French Revolution* (1890); *Outlooks from the New Standpoint* (1891); *The Problem of Reality* (1893); *German Society at the Close of the Middle Ages* (1894); *Socialism, its Growth and Outcome* (in conjunction with the late William Morris) (1894); *Outspoken Essays on Social Subjects* (1897); *The Peasants' War in Germany* (1899); a new *Life of Marat* (second edition) (1901); *Rise and Fall of the Anabaptists* (1903); *Essays in Socialism, New and Old* (1906); *The Roots of Reality* (1907); *The Last Episode of the French Revolution* (1911); *Problems of Men, Mind, and Morals* (1912); *German Culture, Past and Present* (1915); *Reminiscences and Reflections* (1918); and *The Real, The Rational, and the Alogical* (1920).

**BEAN BEETLE, MEXICAN.** See ENTOMOLOGY, ECONOMIC.

**BEATTY, FRANK EDMUND.** American naval officer, died at Charleston, S. C., March 17. He was born at Azatlan, Wis., Nov. 26, 1853, and, after graduating at the United States Naval Academy in 1875, served through the various grades, being promoted to captain July 1, 1908, and to rear admiral Apr. 27, 1912. He retired from active service on Nov. 26, 1915, but when the United States entered the World War in 1917 was called to active duty and sent to the command of the Sixth Naval District with headquarters at Charleston, S. C. He commanded the United States battleship *Wisconsin* on a world tour in 1908, and was commandant of the Navy Yard at Washington, and superintendent of the Naval Gun Factory, 1910-13. In 1914, on the U. S. S. *Florida* as flag ship, he commanded the first division of the Atlantic Fleet, and in January, 1915, was appointed commander at the Navy Yard in Norfolk, Va. He made his home at Washington after his retirement.

**BEAUX-ARTS INSTITUTE OF DESIGN.** A school of fine arts in New York City, planned after the Ecole des Beaux Arts in Paris, organized in 1916 by the Society of Beaux-Arts Architects. The Institute maintains a school of sculpture at its headquarters, and offers prizes in architecture, sculpture, mural painting, and interior decoration to students in schools of recognized standing throughout the United States. Working under the auspices of the Institute in these schools in 1925-26 there were 1340 architectural students, 165 students of sculpture, 80 in mural painting, and 82 in interior decoration. Various prizes and scholarships are offered to these students through the Institute, the most important being: The Paris Prize of \$3000 given by the Society of Beaux-Arts Architects for two and one-half years' study in architecture at the Ecole des Beaux Arts in Paris; three scholar-

The cabinet as organized on June 17, 1925, was as follows: Prime Minister and Minister of Justice, Vicomte P. Poulet; Foreign Affairs, E. Vandervelde; Education, Cam. Huysmans; Interior, Baron Rolin-Jacquemyns; Agriculture, Count P. de Liedekerke; National Defense (ad interim), Vicomte Poulet; Public Works, A. Laboulle; Finance, A. Janssen; Colonies, H. Carton; Industry and Labor, Joseph Wauters; Railways, Marine, Posts and Telegraphs, E. Anseele.

### HISTORY

**SITUATION AT THE BEGINNING OF THE YEAR.** Unquestionably the outstanding event in Belgium in the early part of the year was the death of the beloved Cardinal Mercier (q.v.), who won world wide fame during the war because of his staunch defiance of the German military government in the interests of the Belgian people. The settlement of the war debt as described in the preceding YEAR BOOK was ratified by the Belgian parliament with only two dissenting votes, although later on in the year there was severe criticism of the arrangement on the grounds that it was too harsh. One problem that interested parliament and the people to no slight degree was the question of the reduction of the armed forces of the nation. General Kesten, the Minister of Defense, in introducing his 1926 army bill suggested that service with the colors should be reduced to ten months. The Democrats and Socialists with the press behind them demanded that this provision be made retroactive so as to apply to the 1925 class also. General Kesten bitterly opposed this move, and, upon finding himself not backed up by the majority of the cabinet, resigned. His resignation was accepted on January 18. General Maglinse, Chief of the Belgian Staff, resigned on January 22, for the same reason. Industrial disturbances were also more or less rife at the beginning of the year. The general strike in the metal working industries was settled by a compromise between the workers and the employers.

**THE FALLING FRANC.** During the months of March the country first experienced the woes of a rapidly declining currency, which was to cause so many radical moves later on in the course of the year. From March 15 to March 26, the franc dropped from 4.04 to 3.97 cents. Many blamed the drop at that time on the failure of the United States Senate to ratify the debt agreement, although this was vigorously denied by both the Belgian and American governments. Competent observers declared that the fall of the franc was due to fear in the London market that Belgium would not be able to balance its budget, and, consequently, would not be able to float the international loan that she wanted. This resulted in the sale of Belgian francs with the consequent glutting of the market and the severe fall in exchange rates. A small cabinet crisis was precipitated by the drop in the value of the franc. There was some talk of overthrowing the Janssen government but it came to naught at the time probably due to the absence of Emile Vandervelde at Geneva. The Ministry of Economic Affairs was abolished and its duties incorporated with that of the Minister of Agriculture. Count Liedekerke was named Minister of Agriculture in place of M. Van de Vyvere, who resigned.

As a temporary means of staying the falling franc the buying of foreign exchange was suspended, and the holders of bank notes were permitted to receive gold for them on terms of exchange laid down by the government. On May 6, Albert Janssen, Minister of Finance, resigned, which move was followed by a further decline in the value of the franc. The press stated that his resignation was caused by his failure to handle in a satisfactory manner the various and growing problems of Belgian finance, particularly his failure to float a \$150,000,000 stabilization loan among British and American bankers. His resignation was in quick succession to the resignations of Henri Carton, Minister of Colonies, and Baron Edouard Rolin-Jacquenupus, Minister of the Interior. These resignations precipitated a cabinet crisis at a time when Belgium could least stand it.

**CABINET RECONSTRUCTION.** On the day after Janssen's resignation, Premier Poulet made an effort to reform the ministry by asking the Catholic Party to join a coalition. The Catholic Party refused to do so on the grounds that an entire new ministry was necessary. The Socialist leader, M. Brunet, was unsuccessful in his attempt to organize a ministry because the Liberals refused to join his ministry unless it was limited to the question of finance. On May 22, Henri Jaspar of the Catholic Party, and former Minister of Foreign Affairs, finally formed a group to run the government. It was made up as follows: Premier, Minister of the Interior, and Health, Henri Jaspar; Justice, Paul Hymans; Finance and the Colonies, Baron Maurice Houtart; Agriculture and Public Works, Henri L. Baels; National Defense, Charles de Broqueville; Foreign Affairs, Emile Vandervelde; Sciences and the Arts, Camille Huysmans; Industry, Labor, and Social Welfare, Joseph Wauters; Railroads, Posts, Telegraphs, Marine, and Aeronautics, Eduard Anseele; Minister without Portfolio, Emile Francqui. Premier Jaspar immediately announced that the entire resources and energy of the cabinet would be turned toward the restoration of the franc and the rehabilitation of Belgian finance. On June 5 his budget was unanimously approved by the Senate, despite the fact that it imposed very heavy taxes on motor cars, income from real estate, and theatres. It was believed that these new taxes would bring in an additional revenue of 1,500,000,000 francs of which the land tax would produce 150,000,000. New taxes on customs and excises were expected to bring in 530,000,000 francs, the stamp tax, 700,000,000 and the tax on liquors, 72,000,000.

Premier Jaspar announced that he expected to do the following things: Establish a sinking fund for the payment of the national debt; increase considerably both the direct and indirect taxes; renew foreign credits already granted; and stabilize the franc as soon as a ratio could be determined. It was generally believed that the financial measures of the government were the work of Emile Francqui, the minister without portfolio. About the first of July the Belgian franc was quoted at 39.75 to the dollar but had risen to 38.50 by the end of the first week because of the large surplus in tax receipts.

On July 13 and 14 the Senate and the Chamber took drastic measures to solve the financial muddle. Both houses voluntarily deprived them-

selves of power to deal with the situation and conferred on the King the sole power of rescuing the country from bankruptcy or whatever else stared it in the face. One of the earliest measures resulting from this change was the bill turning over the State railways to a private company for operation. A discussion of this measure will be found above under the paragraphs dealing with *Communications*. Among the measures placed in effect were the abandonment of work on public works not considered essential; the forbidding of the importation of white bread; the placing of telephone and telegraph services under control similar to that of the railways; a tax on foreigners; the increase of the tax on lodgings; and economies in the running of the government. Premier Jaspars stated that the public's response to the government programme "is a clear indication that the whole country, without distinction of class, presents an unbroken front to what is called here 'the battle to save the franc.'" The government hesitated a long time before taking up the question of the stabilization of the franc. It was felt in Belgian financial circles that action on the part of Belgium would be useless unless accompanied by similar action on the part of France which was suffering to a greater extent even than Belgium from the fall in franc values.

On September 8, M. Francqui held a conference with M. Poincaré on this mutual phase of the question, but according to the press received very little encouragement largely because France had not been as successful as Belgium in the preliminary steps necessary to such a move. Early in October an arrangement was reached between the Bank Nationale and the Bank of England, the Federal Reserve Bank, and other banks whereby a loan of considerable size was promised whenever the government of Belgium should stabilize the franc. Spurred on by this promise the government went ahead very rapidly with its stabilization projects and on October 25, it was actually brought about with the ratio fixed at 36 francs to one dollar.

The new monetary system as introduced was based on a new unit known as the *belga*, which had a fixed gold value of .209211 gram. No such coin was put into circulation but the term merely signified five francs and was only to be used in connection with foreign exchange. A new metal currency was put into circulation to replace certain of the franc notes. Gradual increases were to be made in the amount of this new currency in circulation until the sum should be about 125,000,000 francs. The stabilization movement was everywhere successful. The new money went above par on the foreign exchange market and the international loan of \$100,000,000 was oversubscribed. Other favorable factors in the financial situation were the consolidation of the floating internal debt, the tremendous increase in the amount of taxes collected and the purchase of more than \$70,000,000 on the foreign exchange market without lowering the value of the franc to any great extent. The faith of the people in Jaspars' government and financial measures was shown in the elections held in October when the Catholic Party increased its seats in the chamber from 14 to 17, while the Liberals, Socialists, and Christian Democrats lost considerable strength. The results were interpreted as meaning the willingness on the part

of the people to support the conservative government to bring about the necessary financial measures to place Belgium back on her feet. The successful conclusion of the financial difficulties was followed a decided return of capital to the country.

On December 5, the government completed plans for the sale of the Belgian navy, which consisted of 17 mine layers and some coast patrol vessels.

**BELL, EDWARD.** British publisher, died in London, England, November 8. He was born in 1844, the son of George Bell, and after being educated at St. Paul's School and Trinity College, Cambridge, entered the publishing house with which his family had long been connected. He was known in England not only as a publisher, but also as an author and man of letters, having been the translator and editor of *Goethe's Early Letters*; *Wilhelm Meister's Travels*; and the *Nibelungenlied*; as well as having written *Architecture of Ancient Egypt*; *Prehellenic Architecture in the Aegean*; *Hellenic Architecture*; and *Architecture of Western Asia*. He was president of the Publishers Association 1906-09, and was a commissioner of income and land tax. At the time of his death he was chairman of George Bell & Sons, Ltd., publishers.

**BELL, GEORGE, JR.** American soldier, died at Chicago, Ill., October 28. He was born at Fort McHenry, Baltimore, Md., Jan. 23, 1859, the son of Brigadier-General George Bell of the United States Army. He graduated from the United States Military Academy in 1880 and was commissioned second lieutenant in the Third United States Infantry. In addition to service in the regular army he studied law at the University of Minnesota and at Cornell University, receiving the degree of LL.B. from the latter institution in 1894, and later being admitted to the New York Bar. He was professor of military science and technology at Cornell University, 1892-96, and participated in the Cuban Campaign before Santiago in 1898, and also in the Philippine Insurrection in 1900-03, being recommended for brevet rank of major for his services in the latter campaign. With his command he captured General Vincente Lukban, head of the insurrection in Samar, which put an end to the insurrection in that region. He also captured the leader of the insurrectionists in Leyte in the campaign against the Pulajanes in 1907, bringing peace to the Island. He served in the inspector general's department in 1907-13, being head of the military mission sent to the Swiss maneuvers in 1911. He was made colonel of the Sixteenth Infantry, Mar. 9, 1913, and brigadier general, July 17, 1914. He was promoted to major general of the national army Aug. 5, 1917, and in September was appointed commander of Camp Logan, Houston, Texas. He became commander of the Thirty-third ("Prairie") Division of the American Expeditionary Force in July, 1918, and after the War commanded the Sixth Corps Area with headquarters at Chicago. He became major general in the regular army, Mar. 22, 1921, and retired from active service, Nov. 30, 1922.

**BELL, GERTRUDE MARGARET LOWTHIAN.** British orientalist, and oriental secretary to the High Commissioner of Iraq, died at Bagdad, July 12. She was born July 14, 1868, the eldest daughter of Sir Hugh Bell, an ironmaster of the north of England, and was educated at

Queens College, London, and at Lady Margaret Hall, Oxford University. Soon after her graduation, and unattended by any other European, she traveled across the Arabian peninsula from west to east to the Shammar stronghold at Hayil, which for many years had not been visited by a European. This exploration secured for her a gold medal of the Royal Geographical Society. In addition to her taste for traveling, she also studied the language of the Arabs and, being able to speak the native tongues fluently, she won their confidence and respect. In 1915 she became attached to the Military Intelligence Department at Cairo and, in the following year, was liaison officer of the Arab bureau in Iraq. In 1917 she was assistant political officer at Bagdad, and four times was mentioned in dispatches for her services.

During the War, disguised as an Arab, Miss Bell penetrated into Turkey and was the means of bringing many Arab chiefs into alliance with Great Britain. It was stated that the Turkish Empire put a price of \$150,000 for the capture of Miss Bell and Col. Thomas Lawrence, an Englishman, who was also working in this field with great advantage to the British Empire. When the mandate for Iraq was given to Great Britain Miss Bell was made secretary to the High Commissioner Sir Henry Dobbis, and she worked zealously to build up an Arab kingdom, aiding King Faisal who with his queen was under her tactful influence. In this way she worked to develop an Arabian nation and demonstrated that she was a capable administrator as well as a fearless traveler and scholar. It was due to her efforts that the kingdom of Iraq was opened up to archaeological research, and that a working arrangement between King Faisal and British and American archaeologists was reached. She was interested in the work at Ur and Kish.

Miss Bell was the author of a notable work published in 1907, *The Desert and the Sown*, and a volume published in 1911 entitled, *Amurath to Amurath*, in which she discussed not only Near Eastern politics, but recent archaeological and topographical research in Mesopotamia. Her other works included: *Safar Nameh* (1894); *Poems from the Divan of Hafiz* (1897); in collaboration with Sir William M. Ramsay, *The Thousand and One Churches* (1909); *Palace and Mosque at Ukhaidir* (1914); *Review of the Civil Administration of Mesopotamia* (1921). In addition to her activities in Arabia and the Near East, she was also at home in England where she maintained places in Yorkshire and a town house in London. She was considered one of the best informed Europeans on oriental conditions ranging from archaeology to modern politics, and her influence in British Policy in this field was paramount in British foreign politics.

She was often referred to, in print, as the "Uncrowned Queen of Mesopotamia," and was considered by many, at the time of her death, the most distinguished woman of the day.

**BEREA COLLEGE.** A non-sectarian, co-educational institution at Berea, Ky., founded in 1855, and designed to serve the educational needs of the mountain people of the Southern Appalachians. The enrollment for the autumn of 1926 was 1908, divided as follows: College, 434; Normal, 186; Academy, 438; Foundation-Junior High School, 707; Training School, 140;

special students, 3. In the summer school of 1926, 272 students were enrolled. The faculty had 91 members, distributed as follows: College, 28; Normal, 11; Academy, 18; Foundation-Junior High School, 29; Training School, 5. During the year four members were added to the faculty of the College and four to that of the Academy. The endowment amounted to \$7,331,093.06, and the income for the year ending June 15, 1926, was \$208,768.31. A new gymnasium for women was completed during the year. The library contained about 49,500 volumes. President, William J. Hutchins, D.D., LL.D.

**BERMU'DA.** A British colony in the West Indies consisting of a group of small islands lying about 580 miles from Cape Hatteras, N. C. About 20 of the islands are inhabited. Because of its picturesqueness and proximity to New York (677 miles) it is a favorite winter resort for American tourists, who number annually some 28,000. Area, 19.3 square miles; population, according to the census of 1921, 20,127 (7006 white). The estimated civil population in 1924 was 23,280. Statistics for commerce and finance follow:

	1923	1924
	£	£
Imports . . . . .	1,882,401	1,815,023
Exports . . . . .	493,800	446,252
Revenue . . . . .	309,916	329,189
Expenditure . . . . .	277,925	312,969

In 1924 the total tonnage of vessels entered and cleared was 2,758,305 tons of which 2,360,159 were British. The public debt in 1924 was £45,000. The chief products are: Potatoes, onions, lily bulbs, and various vegetables. The chief imports in 1924 were: provisions, beef, bran, clothing, cotton goods, electrical goods; flour; hardware; fuel oil; and woolen goods. The chief exports are: Potatoes; onions; other vegetables; bulbs, and whiskey. The administration is under a governor assisted by an executive council of seven members and a legislative council of nine members appointed by the king and an elected assembly of 36 members. Governor in 1926, Lieut.-Gen. Sir Joseph John Asser.

**BERMUDEZ,** bẽrmoo'das, JORGE. Argentine painter, died at Granada, Argentina, in August. He was born at Buenos Aires, Sept. 15, 1883, and began his studies of art in that city. He was sent to Europe at the expense of the Argentine government, studying and traveling extensively. He exhibited paintings at the Paris Salon in 1910-11-12, and in the latter year, in the Gallery of Buenos Aires, showed an immense canvas, "In Old Castile" (En Castilla la Vieja) which indicated the influence of Zuloaga. His later work manifested more personal characteristics, and in 1913 he received first prize in the Argentine Salon for "The Red Poncho" (El poncho rojo). He also was awarded prizes in the exhibitions of Córdoba and Rosario, and in 1915 at the San Francisco Exposition received a gold medal. Most of his subjects were derived from northern Argentina. He was looked upon as one of the most vigorous and finished painters of Argentina.

**BER'TRAND,** bẽr'trãn', FRANCISCO. Former president of Honduras, died at La Ceiba, Honduras, July 16. He was born in 1870 and, be-

coming active in political life, on Feb. 21, 1912 was inaugurated as vice-president with Gen. Manuel Bonilla as president. On Mar. 13, 1912, on the death of Bonilla, he succeeded to the presidency, holding office to 1913, when he resigned with the consent of congress to become a candidate for the ensuing term. On Oct. 24, 1915, Bertrand was elected president for the term beginning Feb. 1, 1916. During his administration he attempted to pacify the various political parties of the country, declaring a general amnesty for all political exiles of various regimes, and shortly before his resignation in 1919 he called a conference of representatives of the Central American republics to consider their union in a federation, but the plan was opposed by several of the countries. His resignation in 1919 resulted from a revolution growing out of the activity of rival parties eager to elect his successor, the movement being started by Gen. Lopez Gutierrez. The general charged that, due to measures taken by President Bertrand, it would be impossible to have a free-election. General Gutierrez was a candidate in opposition to Nazario Soriano, a brother-in-law of President Bertrand, who received the latter's support. President Bertrand after his resignation left the country for the United States and lived in New Orleans until a few months before his death, when he returned to Honduras. After his departure the insurrectionists agreed on a truce to insure freedom of voting in the subsequent election. It was reported that Dr. Bertrand and Carlos Melendez, the former president of Salvador, in 1919 had agreed upon the "basis of a treaty," by which the constitutions of the two countries should be annulled and the two nations amalgamated into one republic.

**BERYLLIUM.** See CHEMISTRY, INDUSTRIAL.

**BES-SARABIA.** Formerly a government of the Russian Empire; joined to Rumania in March, 1918. Area, 17,146 square miles; population, estimated in 1919, 2,344,800. It is represented in the Rumanian legislature by 51 deputies and 24 senators. See RUMANIA.

**BETTIS,** CYRUS K. American soldier, first lieutenant Air Corps, U. S. A., died at Washington, September 1, as the result of an accident occurring August 23 while on his way from Philadelphia to Selfridge Field, Mt. Clemens, Mich. Lieutenant Bettis was born at Carsonville, Mich., Jan. 2, 1893. He enlisted as a private in the aviation section of the Signal Corps, U. S. A., Jan. 25, 1918, and September 11 of that year was made second lieutenant, Air Service, temporary rank. July 1, 1920, he was commissioned second lieutenant, Air Service, U. S. A., and the same date promoted to first lieutenant. After serving as a pilot on the Mexican Border and in the Philippine Islands, in 1924 he won the John L. Mitchel Trophy at Dayton, Ohio, awarded annually to pursuit planes, with an average speed of 173.43 miles per hour. In 1925 he won the Pulitzer Trophy in the National Air Races held at Mitchel Field, Long Island, with an average speed of 248.975 miles per hour. He, with Lieut. James H. Doolittle, winner of the Schneider Cup Race for 1925, in the following year was awarded the Clarence Mackay trophy for the most meritorious flight of the year. During the summer of 1926 he was engaged in a number of flights from the Sesqui-Centennial Grounds at Phila-

delphia, and on August 23 with two other planes he was engaged in a flight from that city to Selfridge Field, Mich. Flying into a fog bank his plane crashed into a tree on the side of a mountain near Lewistown, Pa. The plane was seriously damaged and Lieutenant Bettis, with a broken leg and both jaws fractured, crawled six miles to the road, where he was found and taken to Bellefonte, Pa., after having been missing for 43 hours. He was brought by airplane ambulance to the Walter Reed General Hospital at Washington and his recovery was anticipated until spinal meningitis developed, which resulted in death.

**BIBLE SOCIETY, AMERICAN.** A society founded in 1816 which strives for a wider circulation of the Bible to all people without denominational or racial discrimination. The Bibles are furnished at cost prices and distributed through the Society's home, foreign, and other agencies. In 1925 the home agencies distributed 2,587,236 volumes; the foreign agencies 5,479,926. The Society supplied the Scriptures in 152 languages during the year, including editions in Roman and Gothic characters and embossed systems for the blind. The total issues of the Society in 110 years of service have been 174,121,599 volumes, of which 98,024,153 were distributed in the United States and 76,097,446 in foreign lands. The number of issues in the United States in 1925 was 3,646,548, of which 1918 were for the blind, and in other lands 5,567,875, making a total of 9,214,423. Workers in the ten home agencies totaled 794, of whom 311 were volunteers; workers in the 12 foreign agencies numbered 2704, of whom 637 were volunteers. The work of revising and translating the Bible into additional languages was going on constantly and progress was reported to have been made during the year in translation and revision work in Yiddish, Spanish, Miskito, Cakchiquel, Aymara, and Brazilian-Portuguese for the western hemisphere, Soochow Colloquial and Canton Colloquial for China, Panayan, Cebuano, Samareño, Bicol, Tagalog, and Ilocano, for the Philippines, and Olunoyere, Bulu, and Luba-Lulua for Africa.

The total receipts of the Society for the year from invested funds, donors, sale of books, etc., amounted to \$1,036,128.80; its expenses were \$1,028,660.26. The Society was affiliated with 124 auxiliary Bible Societies throughout the United States, which assist in the circulation of the Scriptures and contribute to its expenses. In 1925 the contributions from this source amounted to \$21,416.05. The officers in 1925 were: E. Francis Hyde, President; Rev. William J. Haven, LL.D., and Rev. Arthur C. Ryan, General Secretaries; Rev. Lewis B. Chamberlain, Recording Secretary; and Gilbert Darlington, D.D., Treasurer. The official organ of the Society is the *Bible Society Record*. Headquarters are at the Bible House, Astor Place, New York City.

**BICYCLING.** See CYCLING.

**BIERCK,** berk, ALBERT BOYKIN. American railway official and comptroller of the Philadelphia and Reading Company, died at Westport, Conn., August 28. He was born at Westport, Conn. Oct. 9, 1867, and after studying at New York University in 1887, became a freight clerk with the Pennsylvania Railroad at New York. He served in charge of lighterage for the Baltimore and Ohio at New York, as traveling

agent for the Northern Pacific and Union Pacific, train dispatcher for the Northern Pacific, general manager and auditor for the Prospect Park & Coney Island, also general auditor for the Long Island and the Montauk Steamship Company. On Aug. 12, 1918, he became federal auditor of the Philadelphia and Reading, the Central of New Jersey, the Staten Island Rapid Transit, and the Baltimore and Ohio, New York terminals. On Feb. 18, 1920, he became comptroller of the Philadelphia and Reading, serving in addition as assistant secretary, and for a time, in addition acting as vice-president.

During the World War he was in France assisting Maj. Grayson M.-P. Murphy in the organization of the Red Cross.

**BIGLAND, PERCY.** British artist, died at Stone Dean, Jordans, Buckinghamshire, England, April 8. He was born at Birkenhead in 1858, a son of Quaker parents, and was educated at the Friends School at Sidcot, Somerset, after which he was for seven years an art student at Munich, where he received the first medal of the Royal Academy of Munich in 1880. He was a portrait painter whose pictures were shown regularly at the Royal Academy in London. In 1896 his best known painting, "The Quaker Wedding," was exhibited. The composition included the portraits of several old Quaker worthies. During the War he visited various prisons to bring comfort and aid to the members of the Society of Friends, who had been given hard labor sentences for refusing military service, and in the year 1926 he traveled as far as India as a member of a delegation of the Friends Foreign Mission Association. Purchasing a seventeenth century house at Stone Dean at the old Quaker centre at Jordans in Buckinghamshire, opposite to the meeting house where William Penn is buried, he established a centre which became a gathering place for Quakers from all parts of the world. Bigland was an original member of the Royal Society of Portrait Painters in London.

**BILLIARDS.** Billiards displayed a healthy growth during 1926, despite the fact that there were few important professional tournaments held. The game appears to be steadily increasing in popularity among amateur players. The professional 18.2 balkline title changed hands twice during the year. Jacob Schaefer wrested the championship from Edouard Horemans of Belgium in a match played at Chicago by a score of 1500 to 890. Schaefer in turn bowed to Erich Hagenlacher of Germany at Philadelphia by a score of 1500 to 1344. In an 18.1 balkline match Schaefer defeated Willie Hoppe, 3000 to 2926.

In pocket billiards Ralph Greenleaf regained the title he had held for six years and lost to Frank Taberski in 1925. Otto Reisel captured the three-cushion honors.

New champions were enthroned in amateur billiards. John Clinton, Jr., captured the 18.2 championship in Class A., C. P. Matthews in Class B., and Franklyn Hammer in Class C. Clarence Hurd displaced Carl Vaughn as national amateur pool and billiard champion.

**BOBBS, WILLIAM CONRAD.** American publisher died at Indianapolis, February 11. He was born in Montgomery County, Ohio, Jan. 25, 1861, and after a public school education at Indianapolis entered the employment of Merrill, Meigs & Company, booksellers in Indianapolis in 1879, becoming a director of the company in 1890, and president of its successor, The Bobbs-Merrill Company, in 1895. Under Mr. Bobbs' direction the publishing firm which succeeded the old established booksellers rapidly developed and its output soon represented the work of many authors from different localities, and made of Indianapolis a centre of bookish activities for the middle west. He was interested in many commercial enterprises, being a director of the Indiana National Bank and of the Enterprise Iron Works, and chairman of the executive committee of the State Life Insurance Company. He was connected with commercial organizations of Indianapolis as well as a member of clubs in Indianapolis, Chicago, and New York where he also maintained an office.

**BOHEMIA.** A constituent member of the state of Czecho-Slovakia (q.v.) since the defeat of the Central Powers in 1918; formerly a crownland of Austria; situated in the northwestern part of the former Austro-Hungarian Empire, with Saxony and Silesia on the north, Moravia on the east, and Lower and Upper Austria on the south. Area, including the small Austrian and German territories which were added by the peace treaty to Czecho-Slovakia, 20,102 square miles; population, Feb. 15, 1921, 6,670,582. Bohemia is represented in the Czecho-Slovak legislature by nine deputies and five senators.

**BOILERS.** In 1926 the tendency to use larger units, higher pressure, and to expose the maximum surface to the heat of the fire continued to be the leading feature of boiler development. In the annual review published in *Power* (New York), and used in preparing this summary, it was stated that it had been found that heat transfer by radiant heat might result in the absorption of 70 pounds B.t.u. per hour per square foot of exposed surface, which would correspond to .21 per cent of rating, or the evaporation of about 63 pounds of water per hour per unit of surface. One of the notable boilers at the end of the year was that of the Commonwealth Edison Company at the Calumet station in Chicago, where a high rate of combustion was secured by surrounding the furnace with a steam-making surface with a relatively small boiler, but with much of its surface exposed to the radiant heat, and transferring the less active convection surface to the counter-flow economizer. This boiler had not been tested at the end of the year, but its functioning was awaited with interest. Other interesting equipment was the provision of two combustion steam generators with air heaters and

unit pulverizers at the new plant of the Solvay Process Company at Syracuse, N. Y. These would generate steam at 825 pounds pressure, 25-pound gage pressure, for two 5000 kw. turbo-generators operating against a back pressure of 165 pounds gage for process work. In this type of boiler a comparatively small surface per given output is required, as practically the entire heating surface is exposed to the radiant heat of the fire. A high furnace temperature is secured by the use of highly pre-heated air.

In another type of steam generator powdered fuel is introduced through the centre of the top drum, the tubes surrounding the furnace in bird-cage fashion. At the bottom drum an opening permits access to the interior for cleaning, etc. The air is introduced tangentially and the arrangement of bricks is such as to reflect heat from the furnace. One of the high pressure boilers of the year was the Lakeside unit which was operating successfully at 1350 pounds. This was of special three-drum Stirling design with 28,532 square feet of surface in three-inch tubes. The steam temperature is 720 degrees Fahrenheit, produced by radiant super-heaters lining the walls of the furnace, and a radiant re-super-heater raises the temperature of the steam exhausted from a 7000 kw. turbine at 317-pound gage pressure, and a temperature of 447 degrees before being delivered to the main steam header of the plant.

In Europe a number of experimental installations for high pressure steam generation were under way, among which was that at the Witkowitz Coal Mines in Moravia, where a Loffler steam generator was being installed in an 18,000 kw. plant generating steam at 1500 to 1700 pounds. Here, with a so-called "fireless boiler," steam is delivered by a pump to nozzles which bubble it through water in a heavy drum. The arrangement makes possible an output of saturated steam which is pumped back through the super-heater, with the excess available for outside consumption. The boiler arrangement contains merely a super-heater and economizer. In a German boiler also designed for pressure operation there were both primary and secondary systems, the former being closed and consisting of a coil lying in the drum of the secondary system. Condensation of the primary steam in this coil would generate secondary steam from pure or impure water. In an experimental installation designed by Sulzer Brothers of Winterthur, Switzerland, a low-pressure boiler is combined with a high-pressure generator in the same setting, the former operating at around 200 pounds, pre-heating the high-pressure feed, and supplying the high-pressure boiler, which produces steam at a pressure of around 1500 pounds.

From experiments and studies undertaken during the year it seemed evident that higher steam temperatures than those hitherto deemed feasible could be employed. Especially was this true in view of various metallurgical developments. Thus where it had not been considered advisable to make use of steam temperatures in excess of 750° F. now by the use of certain low-carbon steels higher temperatures, at least up to 800° F., can be employed if low unit stresses are used, while recent fatigue tests indicate that the fatigue limit does not decrease appreciably at high temperatures below that at normal temperatures. Experiments with certain special alloy steels

also indicated that higher temperatures could be used. Along with higher temperatures the tendency towards higher pressures continued and in many cases high pressures were preferred to high temperatures. The Langerbrugge Station near Ghent, Belgium, was showing in its high pressure addition an economy of 33 per cent over the older section of the plant. High pressure boilers at Boston and Milwaukee, working at 1200 lb. and 1390 lb. respectively, continued to give satisfaction, while for the Edgar Station in the former city orders were placed for two more 1400 lb. units having 15,003 sq. ft. of surface with air heaters, economizers and water-cooled furnace walls. Higher pressures were not confined to the larger stations, but were finding application in industrial plants also especially those where the steam is employed for process. The usual method was to install a high-pressure generating unit which would exhaust to the existing station header or to process or bleeding at a relatively high pressure, and thus largely obviate the necessity of using live steam, securing increased economy.

The higher pressures called for, even 400 to 450 lb. being in excess of previous practice, were demanding better boilers more carefully made and of heavier materials, and never before was such good workmanship available.

During the year there were a number of installations of waste heat boilers particularly where there was dust in the waste gases so that facilities for tube cleaning were necessary, and where minimum draft losses were secured with maximum heating surface. Interest centred during the year in the electric-boiler steam-accumulator installation at the Riverbend newsprint mill of Price Bros. & Co. in Quebec. Here there were two 32,000-k.w. electric boilers which supplied steam to the plant for process at pressures of 150 lb. and 25 lb. regulated and kept constant by sensitive governor valves. This interesting installation was described in *Power* (New York) Nov. 9, 1926, pp. 688-92. Other high pressure steam accumulators were coming into wide use. Various improvements in superheating were being made to adapt them to high pressures and temperatures. Also the use of the air preheater was becoming more general even in smaller plants. Likewise there was an increase in the number of systems to afford automatic combustion control, the improvements varying in detail and method of operation. It was demonstrated at one large station that practically ideal conditions could be maintained under a proper combination of pressure and feed control.

MERCURY BOILER. In the YEAR BOOK for 1925 and 1923 mention was made of a new type of Emmett mercury boiler and three-stage mercury turbine installed at the Dutch Point Station of the Hartford Electric Light Co. This installation replaced a five-tube type of boiler and single-stage turbine placed in operation in 1923. The mercury boiler after being operated during the latter part of 1925 and the opening months of 1926 was shut down for a few minor changes and repairs which were made by the end of April and the boiler was again put in commission carrying commercial loads during the daytime. The changes made to prevent interference with the liquid circulation by the escape for vapor near the down circulation tubes seemed to be effective and the unit was operated at the highest loads the generator was capable of carrying.

The furnace was changed towards the end of the year to burn pulverized coal in place of oil.

**BOKHARA**, bo-kä'ra. A state in Central Asia, formerly a dependency of the Russian Empire, later known as the Bokharan People's Republic, and since September, 1924, a part of the Soviet Socialist Republic of Uzbek. It is bounded on the north by the Russian provinces of Samarkand and Syr-Daria; on the south by Afghanistan; on the southwest by Transcaucasia and Khiva; and on the east by Ferghana. Estimated area, 79,000 square miles; estimated population, 3,000,000. The chief towns with their estimated populations are Bokhara, 75,000, and Karshi, 25,000. The religion is chiefly Mohammedan. The chief products of Bokhara are corn, fruit, silk, tobacco, cotton, hemp, and farm animals; and the chief minerals are gold, salt, alum, and sulphur. The trade is mainly with India to which raw silk is exported and from which tea, indigo, Dacca muslin, etc., are imported. By the revolution of Aug. 30, 1919, the Amir was dethroned and the Soviet government was set up, which formed a military and political agreement with Russia. In September, 1924, Bokhara and Khiva were joined together to form the Soviet Socialist Republic of Uzbek.

**BOLIVAR**, CONGRESS OF, ANNIVERSARY; BOLIVARIAN UNIVERSITY. See CELEBRATIONS.

**BOLIVIA**. A South American republic situated in the interior and bounded by Brazil on the east and Chile on the west. Sucre is the seat of the supreme court and is historically regarded as the capital, but the actual seat of the government and the largest city is La Paz.

**AREA AND POPULATION**. Estimated figures for the area and population of Bolivia, as given in the latest published report of the Minister of Promotion and Communications, that for the year 1923-24, place the latter at 2,155,000, as against 1,796,500, the population shown by the last official census, taken in the latter part of 1900. The area of the republic is given as 1,332,808 square kilometers, or 506,467 square miles. In 1924 the estimated population of La Paz was 118,250. Other large towns with their estimated populations at the same time were: Cochabamba, 34,281; Potosi, 30,122; Sucre, 16,194; Tarija, 10,843; Oruro, 32,908; Santa Cruz, 18,315; and Trinidad, 6269.

**EDUCATION**. Primary instruction, which is free and obligatory, is under the care of the municipalities and the state. In 1924 there were 1373 elementary schools with 2442 teachers and 80,984 pupils. For secondary education there were 27 colleges, 5 clerical institutions, and 5 private schools, with, in all, 418 teachers and 4098 students. For higher education there are 23 establishments with 260 professors and 1941 students. At Sucre and La Paz are the only two universities with more than one faculty. The university at Sucre, known as the St. Francis Xavier University, is one of the oldest in America, having been founded in 1624.

**PRODUCTION, MINERAL RESOURCES, ETC.** Although nearly 5,000,000 acres are under cultivation, agriculture is in a very backward condition. In some regions irrigation by means of artesian wells is being attempted. The principal products are potatoes, coffee, cacao, barley, rice, and rubber. Bolivia ranks next to Brazil as the largest rubber-exporting country in South America. Mining is the only important industry.

According to the United States Bureau of Foreign and Domestic Commerce, the production and consumption of nearly all the non-ferrous minerals and metals in Bolivia showed large increases in 1925. The favorable conditions in the world metal market, and especially in that for tin, have given unusual prosperity to this country, which supplies 28 per cent of the total tin output of the world. Tin shipments have accounted for approximately 75 per cent of the value of Bolivia's exports, and the export tax on the metal is the principal source of government revenue. Silver and copper exports are next in importance. The world consumption of tin exceeded production in 1925, causing a considerable diminution in the known reserves, which have been low for some years. At the same time prices went up. Production from the department of Potosi amounts to about three times the output of the rest of the republic. Preparation was being made to operate the Arafila tin placers near Potosi, and it seemed probable that a considerable increase in tin production would result. The production of copper in 1925 exceeded all previous yearly records, and the consumption in the United States reached a quantity almost without precedent, although the demand elsewhere was below the normal level. On Nov. 30, 1925, refined reserves of this metal were only half of what they were at the beginning of the year. The production of lead exceeded all precedent because of the demand arising from its uses in cables, batteries, and radio installations.

Exports from Bolivia were considerably higher than in 1924 and were almost four times those for 1923. The following table shows Bolivian mineral exports for 1924 and 1925, as published by the General Administration of Customs Houses in Bolivia:

Product	1924 Kilos	1925 Kilos
Antimony .....	1,409,731	3,146,415
Bismuth .....	399,186	542,497
Copper .....	21,090,807	14,659,382
Tin .....	59,435,567	54,828,520
Gold .....	30	12
Silver .....	13,546,304	11,243,002
Lead .....	38,622,092	36,837,768
Wolfram .....	436	76,288
Zinc .....	485,445	6,209,982
Total .....	123,989,598	127,143,866

**COMMERCE**. Statistics taken from the *Boletín Comercial* and published in the United States *Commerce Reports* dealing with Bolivia's foreign trade in 1925 show that the growth of trade which had been taking place in that landlocked Republic since 1921 continued throughout 1925. The total volume of trade, 307,382,443 kilos, was the greatest in the history of the country, not excepting the European war period, when high prices and strong demand for Bolivian minerals provided a great stimulus to production. The combined values of imports and exports, \$64,392,706, although somewhat under those of the abnormal period of 1917, 1918, and 1919, are, nevertheless, \$9,453,498, or 17 per cent, over the total of 1913 and considerably in excess of average pre-war figures. Both imports and exports have grown. The value of imports in 1925, \$23,393,981, was slightly under that of 1924, but was 15 per cent above 1913 and 70 per cent above 1922. Exports in 1925 were valued at

\$40,998,725, or 18 per cent greater than in 1913 and 56 per cent over 1922. The following table shows the movement of trade in the four-year period of 1922 to 1925, inclusive:

FOREIGN COMMERCE OF BOLIVIA, BY WEIGHT AND VALUE, 1922-1925, INCLUSIVE

Years	Imports	
	Kilos	Value

1925.....	138,619,442	40,998,725

NOTE.—There is a wide divergence in figures of trade between Bolivia and the United States as given in the statistics of both countries. This spread is explainable on the ground that Bolivia, being an inland nation, depends upon the ports of neighboring countries for ocean shipping. Therefore many shipments of goods which eventually arrive in Bolivia are reported in the country of origin, for instance the United States, as destined for the country where they are unloaded, while at the same time in Bolivia they are credited to the country of origin. The same condition holds with respect to exports from Bolivia.

The position of the two principal suppliers of the Bolivian market, the United States and the United Kingdom, which together account for about 50 per cent of the total value of imports, have been reversed since 1913. In that year the participation of the United Kingdom amounted to \$3,815,414, and of the United States to \$1,389,923, and although the share of the United Kingdom had risen to \$4,650,540 in 1925, the share of the United States had risen to the larger sum of \$6,303,071. This increase is principally accounted for by greater purchases of American cotton cloth, wheat flour, canned goods, iron and steel goods (including machinery), automobiles, and explosives. For a discussion of Bolivia's mineral exports, see preceding paragraphs.

FINANCE. The budget estimates for the year 1925-26 balanced at 44,482,183 bolivianos. The principal items of expenditure in the budget were: Public debt, 19,375,880 bolivianos; war ministry, 8,492,950; education, 3,892,246; interior, 3,466,082; communications, 2,171,844; justice, 2,006,361. Towards the end of the year it was announced that at the request of the Bolivian government a financial mission of six members, under the direction of Professor Kemmerer of Princeton University, would visit Bolivia to study the banking system and questions relating to public credit and government loans. Bolivia's public debt at the end of 1925 totaled 134,505,737 bolivianos (the boliviano equalled \$.3382 in 1925, at average rate of exchange), according to a statement compiled by the permanent fiscal commission. This was an increase of 6,670,891 bolivianos or roundly \$2,223,630. The increase of 4,308,840 bolivianos in the external debt accounts for most of this. Despite this increase in the external debt, the part of it represented by loans negotiated in the United States was reduced during the year by 2,952,000 bolivianos. About 92.5 per cent of the foreign debt consisted of loans from the United States.

BOLIVIA'S PUBLIC DEBT AS OF DECEMBER 31  
[In bolivianos \*]

Loan or item	1924	1925
<b>EXTERNAL DEBT</b>		
Yungas railroad loan (Chanderley)	5,809,500	5,511,000
Sanitation loan (Ulen)	4,821,000	4,464,000
American loan of 1922	82,339,500	80,048,000
Potosí-Sucre railroad loan (Patino)		7,260,840
Total	92,970,000	97,278,840
<b>INTERNAL DEBT</b>		
Total	20,647,356	21,368,176
<b>FLOATING DEBT *</b>		
Banks: Ordinary account	8,017,890	8,369,331
Banks: Various accounts	2,650,813	3,944,219
Time obligations	8,155,740	3,240,179
Mortgage banks	393,047	304,992
Total	14,217,490	15,858,721
Grand total	127,834,846	134,505,737

\* The boliviano, at average rate of exchange, equalled \$0.2968 in 1924, and \$0.3382 in 1925.

\* The total for 1925 includes a debit balance of 2,500,134 bolivianos, existing in a special Centennial credit with the Banco de la Nación Boliviano, which should be paid during 1926 from extraordinary revenues specially provided.

COMMUNICATIONS. According to the Pan American Union *Bulletin* for February, 1926, the railways in operation in Bolivia comprised the following: Arica-La Paz Railway, 125 miles in Chile and 151 miles in Bolivia; Antofagasta and Bolivia Railway, 575 miles in Bolivia and 275 miles in Chile; Atocha-Villazón Railway, 127 miles; Empresa Luz y Fuerza Eléctrica de Cochabamba, 49 miles; Guaqui-La Paz Railway, 60 miles; Huanchaca de Bolivia Railway, 26 miles; La Paz-Yungas Railway, 16 miles; additional line under construction; Machacamarca-Uncia Railway, 37 miles; Potosí Sucre Railway, 34 miles, additional line under construction; Bolivia Railway Company, 416 miles. The following roads were projected, and construction on some was commenced: Cochabamba-El Beni, Cochabamba-Santa Cruz, Guayaremerin-Riheralta, Iquique-Oruro, Santa Cruz-Yacuiba, and Santa Cruz-Paraguay River.

GOVERNMENT. Executive power is vested in the president, elected by direct popular vote for four years, who is ineligible for reelection; and in a cabinet of six departments. Legislative power is vested in a congress of two chambers, the senate of 16 members elected for six years, and the chamber of deputies of 70 members, elected for four years. One-third of the senate and one-half of the chamber retire every two years. President, Dr. Hernando Siles, assumed office Jan. 10, 1926, for the period 1926-1930.

HISTORY. On January 10 Bolivia inaugurated a new president Dr. Hernando Siles. Dr. Siles was born at Sucre on Aug. 5, 1881. He received his education at the schools and colleges of his native city and was admitted to the bar in 1905. In 1911 he moved to La Paz and from then until 1917 he was head of the faculty of Civil Law and Justice at the university. During this time he also served as chief official of the Ministry of Justice. Upon returning to Sucre in 1918 Dr. Siles became the Rector of the University of Saint Francis Xavier, a position he was still holding when elected president of the republic. For years he has been a recognized authority on the subject of law, both national

and international, having been named Honorary Professor in the School of Law of the University of Chuquisaca, at which time he was commissioned by the Senate to prepare the *History and Jurisprudence of the Parliamentary Law of Bolivia*. In addition, Dr. Siles is the author of a number of important legal works, notably *El Código Civil*, *El Código Penal*, and *El Procedimiento Civil*, the last named having been published with comment and concordance, in the city of La Paz after he had made a voyage to, and a lengthy stay in Chile, for the purpose of perfecting his knowledge of the legal codes of that country.

At the beginning of February the British press announced plans of a British syndicate for the operation of a concession of 120,000 square miles in Bolivia. The terms provided for a grant of 30,000,000 acres of agricultural and forest land, freehold in perpetuity, 10,000,000 acres of oil rights and 10,000,000 acres of mineral rights. The syndicate has the right to build roads, railways, ports, and factories, and the right to operate steamers under the Bolivian flag. All the syndicate's exports will be duty and tax free for 25 years, and it has the right to import 25,000 European families. In return, the syndicate undertook to build a port at Gaiha, to construct sixty miles of railway to Santo Corazon, and to erect and equip a wireless station. After twenty-five years the port and railway will be transferred to Bolivia.

On August 6th Bolivia celebrated its 101st anniversary of independence. Three days later the congress met to help President Siles solve some of the problems remaining from the brief term of Dr. Siles's predecessor, Dr. Felipe Guzman, who had been in office only a few months.

For a discussion of Bolivia's interest in the Tacna-Arica dispute consult the article on *ARBITRATION, INTERNATIONAL*.

**BOLL WEEVIL**, BOLL WORM. See *ENTOMOLOGY, ECONOMIC*.

**BOLSHEVISM**. See *RUSSIA*.

**BONILLA Y SAN MARTIN**, ADOLFO. Spanish jurist and philosopher died January 18, at Madrid. See *SPANISH LITERATURE*.

**BOOTH**, HERBERT. Evangelist and former commander of the Salvation Army in Canada, died at Yonkers, N. Y., September 25. He was born in Cornwall, England in 1862, the third son of General William Booth, founder of the Salvation Army, and at an early age entered this organization, where he received a thorough training in its work. He was sent to Australia where he spent four years supervising the activities of the organization in the Commonwealth. Later he was in command of the Salvation Army in Canada, and later of a district in Great Britain. He composed some 200 hymns, and was an inspiring singer as well as being able to speak in five languages. In 1903 he left the Army for reasons which he never mentioned publicly, referring to it as "a personal and family matter" which he did not care to discuss. He devoted the remainder of his life to evangelism and came to the United States in 1903 to found the Scientific Evangelization Society, which had for its mission the preaching of the gospel to the unchurched masses, utilizing such aids as motion pictures. He was a friend of William Jennings Bryan and after his death succeeded him, at his request, as superintendent of the Tourist

Bible Class of the First Presbyterian Church of Miami, Florida.

**BOOTS AND SHOES**. In its proceedings of the twenty second Annual Convention, held in January 1926, the National Boot and Shoe Manufacturers' Association reported at length the suggestions of various speakers to the effect that much might be done in the way of inducing a bigger sale of American boots and shoes by an intelligent propaganda scheme. The average life of boots of all kinds had been lengthened by the growing use of the automobile and buyers were to be persuaded to buy more shoes, not because those they had were shabby or worn out but in order to be correctly dressed for all occasions. "No tan boots after six p. m." was one slogan suggested to the meeting. Moreover as most of the sales of women's shoes were made on the dictates of fashion, it would probably strengthen the sales if a well directed local and national publicity campaign were to be undertaken for the education of men to an appreciation of "shoe-sense." Much time was given to discussions of factors which are unnecessarily keeping up the cost of manufacturing and selling.

The imports of foreign shoes into the United States remained steady during the year 1926 and the volume of export was, comparatively, so low that possibilities of developing the export trade were engaging the attention of leaders of the industry during the whole of the year. It was stated that the estimated consumption of the Latin American and Australasian markets was 70,000,000 pairs of shoes, and that, estimated upon the basis of the per capita consumption in the United States, this figure could be increased to ten times this amount. But the annual export from the United States to this entire market did not exceed 5,000,000 pairs. Although the month by month sales of 1925 and 1926 showed a slight increase in the latter year over the former, the grand totals showed practically no advance of sales or production for the home market. The production in November, 1926 was, for all kinds of boots and shoes, 26,768,043 pairs as compared with 24,630,304 in November, 1925. But the production during the period January-November, 1926 actually showed a falling-off from the figures of the previous year, January-November 1926, 299,107,973 pairs, same period 1925, 299,149,466 pairs. The figures issued by the U. S. Department of Commerce are based on reports received from 998 manufacturers representing 1146 factories, and indicated that in the month of November 1926, the production included 7,549,496 pairs of men's shoes, (high and low cut, leather), 1,882,020 pairs of boys' shoes, 8,284,704 pairs of women's shoes, 3,238,813 pairs of misses' and children's shoes, 1,769,006 pairs of infants' shoes, 415,161 pairs of athletic and sporting shoes (leather), 220,037 pairs of shoes with canvas, satin, and other fabric uppers, 420,031 pairs of all-leather slippers for house wear, 2,376,141 pairs of part leather slippers for house wear, and 611,734 pairs of all other leather or part-leather footwear. The figures of production by States were available for the period January to June 1926. Some States having each a single plant are combined in the following statistical report. The total United States production for the first half year was 154,306,180 pairs, made up as follows: Maine, 8,756,809 pairs; Massachusetts, 35,120,225 pairs; Missouri and Illinois, 33,909,-

298 pairs; New Hampshire, 8,910,764 pairs; New York, 34,357,276 pairs; Ohio, 6,558,876 pairs; Pennsylvania, 8,061,771 pairs; Wisconsin, 7,839,767 pairs; all other States, 10,791,394 pairs. Some manufacturers submit reports covering plants located in more than one State, and for this reason it is necessary to combine the statistics for Missouri and Illinois. The figures for the period January to November inclusive for the three years were: 1924, 288,627,764; 1925, 299,149,406; 1926, 299,107,973. Thus, 1926 while showing an advance over the figures for 1924, indicated a falling off from those of 1925 when the year's production was 323,553,000 pairs. In the opinion of the leaders of the industry there were many causes contributing to the lack of rapid advancement in production, and in addition to the high cost of production and selling it was believed that one of the main difficulties is that the industry has found its saturation point in the supply of home demand.

**BORNEO.** An island in the Malay Archipelago, next to Australia, Greenland, and New Guinea the largest in the world. See **BRITISH NORTH BORNEO**, **BRUNEI**, **SARAWAK**, and **DUTCH EAST INDIES**.

**BOS'NIA AND HERZEGOVINA**, hër'tsā-gi-vēna. Formerly provinces in the Turkish Empire; now provinces of the newly established state of Jugo-Slavia (q.v.). In 1908 control over them was acquired by the Austro-Hungarian Empire. In 1918 after the collapse of this empire they were turned over to Jugo-Slavia. Area, 19,768 square miles; population, according to the census of Jan. 31, 1921, 1,889,929.

**BOSTON UNIVERSITY.** A non-sectarian institution of higher education at Boston, Mass.; founded in 1869. The enrollment for the fall term of 1926 was 9184, of whom 4686 were men and 4498 women, distributed as follows: college of liberal arts, 869; college and extension courses, 886; college of business administration, 3456; college of practical arts and letters, 914; school of theology, 255; school of law, 626; school of medicine, 195; school of education, 1003; art department, 77; school of religious education and social service, 456; graduate school, 447. The enrollment for the summer session of 1926 was 1157, and the fall enrollment in extra-mural courses was 1403. The faculty numbered 495. The libraries contained 98,148 volumes and 17,400 pamphlets. Productive funds of the university, exclusive of \$279,200 subject to annuities, amounted to \$3,396,300, and the income from productive endowment was \$121,300. New buildings during the year included two new dormitories, one for the women students of the School of Religious Education and Social Service, an anonymous gift, and the other for School of Theology students, the gift of Mrs. G. L. Richards, a trustee. A Bureau of Consumer Research was established by the household economics department to give practical instruction in household economics research and to cooperate with manufacturers in providing reports on what women want and will use. A gift of significance was that of \$10,000 given by Mrs. Robert Bacon of New York to found a special lectureship on the United States Constitution in the College of Liberal Arts, the lectures to be given by eminent authorities each year, to be open to the public, and to be printed in book form for dissemination after delivery. A campaign for an additional endowment of \$1,500,000

was successfully completed during the year by the College of Liberal Arts, \$1,100,000 being raised by pledges and \$400,000 the gift of the General Education Board. Dr. Daniel L. Marsh of Pittsburgh, Pa. A.M., D.D., LL.D., was elected president of the university on December 30, 1925, and inaugurated February 1, 1926, to succeed Dr. Lemuel H. Murlin, who resigned on January 1, 1925 to accept the presidency of DePauw University.

**BOTANY.** An International Congress of Plant Sciences, which constituted the Fourth International Botanical Congress, met at Ithaca, N. Y., August 16 to 23. The congress was attended by more than 700 members, the United States, Canada, most of the European countries and many others being represented. An International Conference on Flower and Fruit Sterility was held in New York City, August 11 to 13, which was attended by many foreign and American delegates to the Plant Congress at Ithaca, N. Y.

**NECROLOGY.** Among botanists of international reputation, the deaths of whom were reported during the year, were: William Bateson, director of the John Innes Horticultural Institution and well known for his contributions to genetics and biology, February 1; Luther Burbank, world famous plant breeder, April 11; William Fawcett, formerly director of the Botanic Gardens, Jamaica, known especially for his work in applied botany, August 14; J. S. Gamble, noted for his investigations in Indian forest botany, October 16, 1925; Eduard Hackel, eminent Austrian agrostologist, February 17, 1926; George Henslow, professor of botany, Royal Horticultural Society, December 30, 1925; J. H. Maiden, formerly director of the Botanic Gardens, Sydney, Australia, Nov. 15, 1925; G. R. Lyman, formerly in charge of the Plant Disease Survey, U. S. Department of Agriculture, June 7, 1926; C. V. Piper, specialist in forage crop investigations, U. S. Department of Agriculture, February 11; W. E. Safford, economic botanist, especially interested in the plant products of the American aborigines, January 10; Carlos Spegazzini, Argentinian botanist, especially known for his contributions to knowledge of the fungi of South America, July 1; and R. Schlechter, director of the Botanic Garden, Dahlen, Germany, Nov. 15, 1925.

**PHYSIOLOGICAL STUDIES.** Rose, in his recent book, *The Nervous Mechanism of Plants*, claims that plants, at least vascular ones, have a well defined nervous system which he believes functions very much like the nervous system of animals. The phloem is said to be the conducting tissue, and apparatus was devised for detecting and measuring the excitation. Ball was able to transmit stimuli through water connections of severed branches of *Mimosa pudica* when care was taken to exclude air. The failure of others is attributed to the presence of air bubbles from the pith of the stems.

MacDougal, from recent studies on the hydrostatic systems of pine, oak and walnut trees, added testimony to the Dixon theory of a cohesive column of water as the essential element in water movement in the plant. Ursprung contributed data relating to the movement of water in plants. He claims there is a polarity of suction forces exerted by opposite sides of the same cell and that this polarity acting in cells of the root aids in carrying forward the movement of water in the plant as a whole.

The phenomena attending the entrance of dissolved substances into plants and the requirements for what are considered essential elements have been subjects of many investigations. Michaelis claims that the permeability of membranes for different ions in a surrounding solution can be readily studied by the use of the skin of an apple or by a collodion cell which he has devised. The apple skin is said to behave like a metallic electrode toward electrolytes dissolved in water. Clarke claims that the rate of absorption, rather than the final amounts taken up, is an important factor in cell activity. Hibbard found, after many years' study, that the ratio of salts in a solution may vary quite widely without appreciable influence on growth, provided all the essential salts are present in an assimilable form. Recent investigations have extended the number of essential elements for plant growth.

McHargue found that plants require manganese for their normal development. In sand cultures with a number of plants he found that the plants became chlorotic after the small amount of manganese in the seeds was used, and that their normal condition was restored when manganese was added to the cultures. He believes that manganese has an importance in chlorophyll synthesis equal to that of iron and that it cannot be replaced by other elements. Similarly Bertrand and Rosenblatt found manganese in a great variety of plants, the highest content occurring in organs whose biochemical activities were the most intense. Bertrand reports that nickel and cobalt are absorbed and retained in small quantities by plants, and later experiments with animals are thought to indicate that certain chemical elements in infinitely small amounts may play an important rôle in biological activity. McLain cured chlorosis in spinach by spraying plants with a manganese solution. Sommer and Lipman claim that boron and zinc are indispensable to the normal life and growth of a considerable number of species of plants. Levine found that selenium compounds, when given in great dilution, stimulated growth of plants.

Since the announcement of Garner and Allard that plants were intimately affected by the length of day in which they were grown (YEAR BOOK, 1920, p. 83), there have been many investigations carried on to confirm their conclusions regarding photoperiodism and to find an explanation for the phenomenon. Additional experiments of Garner and Allard with *Cosmos sulphureus*, a typical short-day plant, are said to indicate that while darkness does not initiate flowering, it does not inhibit the formation of flower buds under the action of a short daily light period in other parts of the same plant. Adams found that reducing the daylight period from 15 to 12 hours had little effect on tomato plants. However, soy beans flowered earlier and hemp nettle and *Trifolium dubium* later, under the influence of the shorter day. Castor beans were grown from seed to seed production under continual electric illumination. Wheat, buckwheat and soy beans grew better under natural light conditions than under daylight supplemented with electric light. Wheat and sunflowers blossomed earlier and hemp later under supplemented light. Two hours' illumination at midday was equal to three hours in the morning or afternoon, as indicated by the growth, weight

and flowering of a number of species of plants. Adams believes that temperature, as well as period of illumination, must be considered, and he claims that they are equally important and interchangeable for the growth of winter rye and winter wheat at Ottawa, Canada.

In Porto Rico, MacClelland found that Bermuda onions and radishes were favored by prolonging illumination so as to equal the length of the longest day of the year, while roselle, zinnia, poinsettia, soy beans and others flowered and matured quickest in a day corresponding to the shortest days of the year. Pfeiffer claims that plants with short exposure to light are usually low in carbohydrate and in protein reserves. Increasing the period of illumination also increased the carbohydrate reserves without proportional increase in proteins. The maximum growth in height and differentiation of tissues occurred in tomatoes with 12-hour illumination and in buckwheat with 17 hours. Deats found plants differently affected by length of day illumination, and he attributed it to changes in the carbohydrate-nitrogen ratio in the plants. Gilbert found that response to relative day length may be materially influenced by temperature and humidity conditions. High-temperature short-day plants flowered earlier than high-temperature long-day ones. Low-temperature plants vegetated for much longer periods when under either long or short day effect. Setchell claims that temperature is the one controlling factor in flowering of plants, and not the moisture variable or the hours of daylight. Waters found that sporulation of the bean rust was hastened by increasing the hours of light and that continuous lighting shortened the period of host infection by 24 hours.

Maximow, in a paper before the Botanical Congress at Ithaca, N. Y., reported the results of investigations on the water relations of plants that are somewhat at variance with the usually accepted views. He claims that xerophytic plants transpire intensely and have high water requirements, while shade mesophytes lose water slowly. During the hottest, driest periods xerophytes have their leaves in a state of permanent wilting, but on account of their structure they are able to endure wilting better than mesophytes. The capacity to endure wilting without injury is the chief peculiarity of drought-resistant plants.

A considerable number of investigations were reported on prolonged vitality and factors which influence germination of plants. Holman and Brubaker reported that pollen has retained its vitality for 336 days under favorable conditions and that pollen of a large number of plants survived storage in air-dry conditions for several weeks when protected from light, high humidity and fluctuating temperatures. This information should be of value to plant breeders, generally. Nelibow has found a method for the rapid determination of the viability of seeds based upon their response to certain coloring agents. Oppenheimer claims that many seeds do not germinate while attached to the mother plant by reason of a lack of water, the presence of acids in the plant and the occurrence of inhibitory substances that disappear in the after-ripening of the seeds. Brink found that yeast vitamine stimulated the growth of pollen tubes and that similar growth-promoting substances occur in the juice of raw potatoes and extracts from the gynecium. Votschal found

that yeast vitamins stimulated the development of yeast and molds and considers the effect as being catalytic. Popoff claims that the stimulating effects of seed treatments are due to increased oxidation processes which accelerate life processes and react on growth and cell increase. To be stimulating to germination, substances must have a decided affinity for oxygen.

Gleisberg believes that the stimulating effect of chemical seed treatments may continue in the growth of the plant. Denny, in reporting on the effect of chemicals in hastening the sprouting of potato tubers, found that chlorhydrin and sodium and potassium thiocyanate solutions were effective in hastening the germination of dormant tubers. Thiourea also was found to force germination, and it caused the simultaneous development of sprouts from all eyes of the tubers and several sprouts from the same eye. The inhibiting effect on germination was destroyed by the treatments, and the tubers did not require the long period of afterripening of normal development. A practical application of these results is seen in the adoption of this method for growing potatoes as a winter crop in tropical regions from certified seed potatoes produced in northern latitudes.

**PLANT DISEASES.** Plant diseases continue to take a heavy toll from many of our most important crops. The *Plant Disease Reporter*, Supp. 49, published estimates of losses due to diseases of important crops in 1925 as follows: Wheat, 80,864,000 bu.; rye, 914,000; barley, 27,049,000; oats, 118,535,000; corn, 254,555,000; potatoes, 86,026; sweet potatoes, 6,039,000; beans, 1,866,000; apples, 22,716,000; peaches, 2,975,000; pears, 3,221,000 bu.; and cotton, 1,171,000 bales. Much of this loss could have been prevented by the wider adoption of control measures, the efficiency of which has been demonstrated.

The wheat disease situation in the United States in 1926, so far as the stem rust, *Puccinia graminis*, was concerned, was on the whole very satisfactory. In the winter wheat areas there was comparatively little loss aside from a portion of Arkansas and in Arizona and southern California. The damage done in the latter region was quite severe. In the spring wheat area some rust was observed during the latter part of July, but by reason of its late appearance the damage was not great. While the stem rust situation was favorable on the whole, the leaf rust, *P. triticea*, was widely spread, the cool, late spring apparently favoring it, and in Oregon considerable injury to spring wheat was reported. The campaign that has been in active progress since 1917 in 13 of the central wheat growing states for the eradication of the common barberry, which is the alternate host for the rust fungus, is making satisfactory progress. More than 14,000,000 barberry bushes have been destroyed and local infections of rust have been greatly reduced. Coarse crushed salt heaped about the bushes is the most effective means for destroying barberry yet found.

The white pine blister rust, known in eastern United States for many years, was first reported on the Pacific Coast in Vancouver and Washington in 1922. It had spread there to the south and east, and late in 1925 it was found in Oregon, 100 miles south of the mouth of the Columbia River. Efforts were being made in the East and in the West to prevent the spread of this disease through the destruction of wild currants and gooseberries, which are the alternate

hosts of the fungus and from which it spreads to the pine. The form of the fungus on the pine cannot infect other pine trees. Federal and state funds available for blister rust control in 1926 were \$572,720, and for 1927 \$636,410 has been provided. A new gall disease of the Scotch pine has been found recently in three localities in New York, and it is feared that it may become a menace to the growing of that and related species of pine. Its injury to the Scotch pine is said to be undoubted.

The citrus canker situation seemed to be very well in hand, and aside from a few localities in Louisiana and Texas the disease appears to have been eliminated. The Florida Plant Board, which is the active agency in citrus canker control in that State, reported on Sept. 30, 1926, that there were no properties within the State that were classed as actively infected.

There was probably no class of plant diseases that was receiving so much attention of investigators during the year as the so-called infectious chlorosis, mosaic or degeneration diseases. Many important crops are involved and the aggregate losses due to these diseases are very great. It has been estimated that the potato crop of the United States in 1925 was reduced by 19,500,000 bu. through these diseases. Their cause is still a matter of controversy. Dr. Sophie Eckerson reports the presence of motile, flagellate organisms, probably protozoans, in wheat and tomato plants which showed symptoms of mosaic, and Jones has described a mycetozoon obtained from tobacco with mosaic-like symptoms. Somewhat similar organisms were cultivated from mosaic tomato plants, from leaf roll potato plants and from the intestinal tract of aphids feeding on mosaic plants. Olitsky claimed to have grown the causal organism of mosaic of tobacco and tomato in culture media (YEAR BOOK 1925, p. 99), but Purdy was unable to obtain such evidence and Mulvania had similar experience. Dickson found that the expressed juice from mosaic tobacco plants, after being kept sealed in bottles for five years, retained its power to infect sound plants.

Duggar and Armstrong have shown that juice of the pokeweed, although the pokeweed is subject to mosaic, inactivates the agency which causes tobacco mosaic. Murphy and McKay in Ireland, and Bolley in North Dakota, have found that mosaic and leaf roll of potatoes may be transmitted through the true seed as well as through the tubers. Fernow made a study of 19 species of plants subject to mosaic and found eight distinct types of mosaic and all but one species of plant were infected by one or more of the mosaics on other plants. When plants were inoculated with two or more mosaics, symptoms were produced that are believed to explain much of the confusion in the description of the diseases by various investigators. At least a dozen forms of mosaic, or degeneration diseases, have been described from the potato. Dickson claims that the so-called streak disease of tomatoes is the result of a double infection with potato and tomato mosaics. Kunkel found that aster yellows could be transmitted by leaf hoppers to 50 species of plants and that on each host the symptoms of disease were quite characteristic for that species. An infectious leaf curl of cotton in Nigeria was described by Jones and Mason, and Bennett reported five distinct virus diseases of raspberries. Tobacco mosaic has been

found in southern Rhodesia where it attacks a common weed, *Ceratotheca triloba*, in addition to tobacco.

Considerable progress has been made in methods for the control of plant diseases. Summarizing investigations for the Crop Protection Institute, Lambert and Rodenhiser claim that the best control of stinking smut, or bunt, of wheat and the smuts of hull-less oats was by the treatment of the seed before planting with two or three ounces of copper carbonate per bushel. Formaldehyde, 1 to 320 solution, controlled smuts but frequently impaired germination. Formaldehyde sprayed over common oats gave the best control of smuts, copper carbonate being much less effective. Formaldehyde treatment was the best for the control of covered smut of barley. Fraser and Simmonds and many others secured the same results with copper carbonate dust for the control of bunt of wheat. This method is extremely practical and is coming into wide use as a substitute for the less desirable and more troublesome method of soaking seed in fungicides. A number of mercury and phenol compounds have been placed on the market recently, and several of them have proved valuable for the control of some seed-borne diseases.

The comparative efficiency of fungicides applied as dusts and as sprays was a matter of variance of opinion. In general it seemed that dusts were more easily applied, but more material was required and dusts were not so adhesive as sprays on many plants. For the control of some orchard and truck crop diseases either can be used with profit. For the control of potato diseases, especially the late blight, Bordeaux mixture, to which an arsenical is added for insect control, has given the best results. In any method of treatment with standard fungicides the efficiency depends very largely on the completeness of covering all the foliage, rather than on the strength of the materials used.

**BOTULISM.** The impression seems to have been obtained in some quarters that botulism has been practically conquered by sanitation, but this is far from the truth. According to an unsigned article in the *Journal of the American Medical Association* for February 13 occasional epidemics continue to appear in the United States. The incidence of the disease was brought up to 1922 in *Public Health Bulletin*, No. 127, from which it appears that beginning with the earliest reports, which antedate bacteriological control, there had been 91 single or group outbreaks in the United States and Canada with totals of 345 cases and 213 deaths, a mortality of 61.7 per cent. Since 1922 there had been recorded 56 additional outbreaks, a few of which antedated that year but escaped recording. The total number of additional cases is 159 with 124 deaths, a mortality of 78 per cent. The grand totals are therefore 504 cases with 337 deaths (66.8 per cent), the total number of outbreaks being 147. The average annual outbreaks number 13 and the highest number was 21 in 1922. In the majority of these outbreaks the food was home canned and apparently any product of canning may be infected. Commercially canned food products infected comprise such varied articles as olives, spinach, clam juice, duck paste, and in more recent years meats, sardines and peas. The food is in the majority of cases openly spoiled but in many episodes there was no sensible spoilage. The majority of the out-

breaks have occurred in the Far West, and while many have appeared in the Middle West the food was sometimes put up in the former area. But few episodes have occurred in the East and none at all in the South. It has been ascertained that there are two different strains of the *Bacillus botulinus* which produce different toxins, distinguished as A and B. This distinction is all important in the serum treatment, for different antitoxins are required. Thus far the large majority of cases have been due to the A strain.

**BOVINE TUBERCULOSIS.** See VETERINARY MEDICINE.

**BOWDOIN COLLEGE.** An institution of higher education at Brunswick, Maine; founded in 1794. In the autumn of 1926 the total registration of 544 students included 116 in the senior class, 92 in the junior class, 152 sophomores, 180 freshmen, and 4 special students. Two additional members of the faculty appointed after June, 1926 increased the total to 42. The amount of the productive funds was \$4,300,100, and the income for the year amounted to \$241,000. The library contained 136,000 bound volumes. President, Kenneth Charles Morton Sills, LL.D.

**BOWLING.** The twenty-sixth annual tournament of the American Bowling Congress was held at Toledo, Ohio, the winners in the various events being; individual, E. Votel, Braddock, Pa., with a score of 731; two-man team, Aston-Young, Akron, Ohio, 1355; five-man team, Castany, Chicago, 3063; all events, Gertoski, Detroit, 1981.

**BOXING.** Six new champions were crowned in the professional boxing world in 1926, the most notable event being the defeat of Jack Dempsey, heavyweight title holder, at the hands of Gene Tunney. This fistie battle took place at Philadelphia, September 23, and attracted the largest attendance in the history of the ring game. The paid attendance was 118,736 and the receipts \$1,895,723. A terrific rainstorm raged during the bout which went the full distance, ten rounds. Although there were no knockdowns Tunney showed marked superiority throughout over the champion, who had been out of competition for a period of three years and who also had been subjected to continuous legal worries during his training preparations.

Other upsets of the year were the winning of the middleweight title by Tiger Flowers from Harry Greb, and Flowers' subsequent loss of the championship to Mickey Walker; the overthrow of Mickey Walker as welterweight champion by Pete Latzo; the defeat of Rocky Kansas, lightweight title holder, by Sammy Mandell, and the capturing of the light heavyweight honors from Paul Berlenbach by Jack Delaney. The three champions who retained their laurels were Fidel La Barba, flyweight, Charley Phil Rosenberg, bantamweight, and Tod Morgan, junior lightweight. Louis Kid Kaplin, after successfully defending his featherweight title by knocking out Bobby Garcia, surrendered the championship to enter the lightweight ranks where he met immediate defeat.

Boxing flourished among the amateurs and in college circles. The winners of the national Amateur Athletic Union championships were; 112 pounds, Lawrence Lyons, Pittsburgh; 118 pounds, Joseph Katkish, Pittsburgh; 126 pounds, Patsy Ruffalo, New York; 135 pounds,

Thomas Lown, New York; 147 pounds, Edward Tierman, New York; 160 pounds, Arthur Flynn, Lawrence, Mass.; light heavyweight, Henry Lamar, University of Virginia; Heavyweight, Armand Emmanuel, San Francisco. The team of the United States Naval Academy carried off the intercollegiate boxing honors.

**BOYLE, EMMET DERBY**, Governor of Nevada 1915-23, died January 3. He was born in Virginia City, Nevada, July 26, 1879, and after graduating from the University of Nevada with the degree of Bachelor of Science practiced mining engineering, being connected with many important companies as mining engineer and superintendent until 1907 when he took up consulting practice. He received the degree of Engineer of Mines from the University of Nevada in 1903 and served as state engineer 1900-10, and a member of the State Tax Commission, 1913-14. He was elected governor of Nevada for two terms serving 1915-23, and in 1918-19 he was a member of the United States Treasury Department Commission on Gold Production. In addition to his mining interests he was the publisher of the *Nevada State Journal* in Reno, and president of the Security Finance Company of the same city. He was also president of the Reno Chamber of Commerce and a member of various mining and other societies.

**BOYLESVE**, hwi'läv, RENÉ. French novelist and member of the French Academy, died at Paris, January 14. He was born at La Haye-Descartes (Indre-et-Loire), April 14, 1867, and was educated at the Collège des Jésuites in Poitiers, at the Lycée de Tours, and studied at the University of Paris in both Faculty of Letters and Law and the School of Political Science. He was made a member of the French Academy in 1919 in recognition of some notable novels which showed striking diversity. He early had the ambition to become a poet, but he found that novel writing was more to his taste, because this form of expression enabled him not only to show his poetic fancy, but a realism in which irony and humor as well as tragic tendencies were exhibited. He wrote under the pseudonym René Tardiveau. His first important novel was *Le Médium des Dames de Néans* (1896); which was followed by *Sainte-Marie-des-Fleurs* (1897); *Les Bains de Bade* (1897); *Le Parfum des Iles Borromées* (1898); *Mademoiselle Cloque* (1899); *La Becquée* (1901); *La Leçon d'amour dans un parc* (1902); *L'Enfant à la balustrade* (1904); *Le bel Avenir* (1905); *Mon Amour* (1908); *Le meilleur Ami*; *La jeune Fille bien élevée* (1909); *La Marchande de petits pains pour les canards* (1913); *Madelaine jeune Femme* (1913); *Tu n'es plus rien* (1917); *Le Bonheur à cinq sous* (1917); *Nymphes dansant avec des satyres* (1920); *Elise* (1921); *Le Carrosse aux deux lézards verts* (1922).

**BOY SCOUTS OF AMERICA**. An organization incorporated in 1910 and chartered by Congress in June, 1916, to develop the character of boys and train them for the duties of adult life by influence brought to bear in their work and play. The National Constitution of the Boy Scouts of America declares the intention to "promote the ability of boys to do things for themselves and others, to train them in scout craft and to teach them patriotism, courage, self-reliance and kindred virtues." Each boy joining the organization takes the Scout Oath,

and the Scout Law requires the members to exert such qualities as trustworthiness, helpfulness, loyalty, kindness, cheerfulness, bravery, cleanliness, and reverence. Among the foremost scout activities are camping and hiking, nature study, and many kinds of outdoor work, exercise, and craftsmanship. Successive ranks in membership are attained by passing tests graded in difficulty. Merit badges, 71 in number, may be attained by meeting requirements for each. These cover proficiency in pursuits both of the useful and of the hobby type, such as dairying, plumbing, pioneering, physical development, astronomy, music, chemistry, and others equally diverse. By attaining certain numbers of the merit badges, a boy may rise to the higher ranks of Star, Life, and Eagle scout.

In 1926, 310,000 boys spent a week or more in camp under Boy Scout auspices. Local councils conducted 569 camps; at least 2200 troop camps were also conducted. The Boy Scout movement, in coöperation with the Forestry Department, fights and prevents forest fires, conserves wild life, and plants trees. It renders services in local campaigns of various sorts and coöperates with many national societies and movements. Membership in 1926 was 626,875, with 172,726 scout leaders. The National Council, the governing body, has its offices at 200 Fifth Avenue, New York. In 1926 the officers were Walter W. Head, Omaha, Neb., president; George D. Pratt, treasurer; James E. West, Chief Scout Executive; Daniel Carter Beard, National Scout Commissioner; Mortimer L. Schiff, International Commissioner. Regional scout districts, 12 in number, under direct supervision of the National Council's National Scout Executives, were subdivided in 1926 into 668 local councils, of which 637 supported paid executives and maintained permanent headquarters. The boys are organized into troops of 32 each. The troops are made up of patrols of eight or less, each under a boy leader. A scoutmaster commissioned by the National Council is provided for each troop. He must be an adult citizen of proved fitness. Troops are commonly formed in connection with schools, churches, or other existing bodies, and each must be sponsored by a troop committee of three or more adults, who select the scoutmaster and supervise the execution of the programme. The movement is non-sectarian, and without military or political connection. The official magazine is *Boys' Life*. The organization also publishes magazines for scout leaders, merit badge pamphlets, and other material.

**BRANT**, JACOB. An Indian descendant of Capt. Joseph Brant, died at Buffalo, N. Y., December 28. He was born in 1856 on the Tyendinaga Indian reservation in Ontario, Canada, being a direct descendant of the famous Indian chieftain of the Six Nations of the Iroquois during the American Revolutionary War. He was active in his early years as a representative of his tribe before the Canadian Government and was known as an orator of force. He addressed the Canadian Parliament at various times in defense of the tribal rights and privileges granted the Mohawks for their aid to the English during the Revolution. At the time of his death he was engaged in the construction of a new home in the city of Buffalo.

**BRAZIL**. The largest of the South American republics; situated in the northern and eastern part of the continent of South America; a

federal republic. Capital and largest city, Rio de Janeiro.

**AREA AND POPULATION.** The area of Brazil is given as 3,286,318 square miles, which gives it an area more than 250,000 square miles greater than that of continental United States. The country is divided into 20 states, one territory and one federal district. According to the census of 1920 the population of the republic was 30,635,605, which represents a density of 9.3 inhabitants to the square mile. The principal cities with their populations, according to the same census are: Rio de Janeiro, 1,167,873; São Paulo, 579,033; Bahia, 283,422; Recife, 238,843; Belem, 236,402; and Porto Alegre, 179,263.

The total number of immigrants entering Brazil in 1925 was 84,883. This was less than in either of the two years immediately preceding, but it was as large as was expected in view of the unsettled conditions in the principal centres of immigration. The three leading sources were Portugal, Spain, and Italy, they being also the three leaders in the grand total of immigration since statistics have been kept. German immigration decreased 70 per cent from 1924 when it was exceeded only by Portugal. On the other hand, Yugoslav and Rumanian immigration which increased greatly during 1924, continued to hold an important position and Japanese immigration increased notably. The total number of immigrants during each of the last five years was as follows: 1925, 84,883; 1924, 98,125; 1923, 86,879; 1922, 66,967; and 1921, 60,784.

**EDUCATION.** Education is free but not compulsory, except in seven states where it is both free and compulsory. According to the latest available statistics, those of the census year, 1920, there were in the various states, 21,748 primary schools with 1,249,449 pupils. 447 were federal government schools, 9612 state government schools, 4712 municipal schools, and 6977 private schools. There were also 450 secondary schools with 48,000 pupils, and 367 professional schools with more than 37,000 students. The university of Rio de Janeiro is the only official university in Brazil.

**PRODUCTION, ETC.** Owing to the vast extent of its agricultural area, the average land holding is of large size. Only a comparatively small portion of the cultivable area is under crops, but recent statistics indicate a rapid increase in the amount, which in 1923 was placed at about 175,104,657 hectares. The chief crop and by far the most important commercially is coffee, which is raised in an area covering about one-eighth of the total country and comprising the four states of São Paulo, Espírito Santo, Rio de Janeiro, and Minas Geraes. Approximately four-fifths of the world's supply comes from this area and one-half of the world's supply from the state of São Paulo alone. The annual crop is estimated at 12,000,000 sacks of 132 pounds each. The crop for 1925-26 was estimated at 850,011 metric tons. There is a large variety of other crops of which the most important are cacao, sugar, cotton, rubber, rice, tea, and tobacco. See the preceding YEAR BOOK for the latest statistics on agricultural products.

Gold, diamonds, manganese, monazite, and mica are among the principal mining products of Brazil. The United States Bureau of Foreign and Domestic Commerce reported in 1926 that the latest available statistics are for the year 1924.

According to that authority, the mica industry recorded for 1924 the highest export for five years, 76 metric tons being exported. Manganese mining continued to be hampered by inadequate transportation, and shipments from Rio de Janeiro during the year reached only 151,043 long tons of which 106,830 went to the United States. Manganese production in the Rio district amounted to 175,768 long tons in 1924, and the stocks on hand at the close of the year to 56,844 tons. The production of gold from the two principal mines was valued at £521,359 in 1924 as compared with £605,881 in 1923. Diamond mining was not so active in 1924 as in previous years. The export value in the former year was 32 per cent less than in the year previous. Monazite and zircon, generally mined together, are found with ilmenite in surface deposits in the state of Espírito Santo. The forests are very extensive and an important source of wealth. Manufacturing is of comparatively little importance, but is increasing rapidly. The principal single industry is cotton milling which employs about 60 per cent of the people engaged in manufacturing. Silk manufacturing is being encouraged, chiefly in the form of a government subsidy to silk cocoon producers.

**COMMERCE.** According to the United States Bureau of Foreign and Domestic Commerce. Brazil, in 1925, had a total foreign trade of 7,444,954 contos, the largest in the history of the country, but the favorable balance of trade was only 582,838 contos—the smallest since the disastrous year of 1921. Converting these two figures into dollars at the average rate of exchange for the year they represent approximately \$894,883,470 and \$70,106,000 respectively. Exports during 1925 were valued at 4,013,896 contos, compared with 3,863,554 contos in the preceding year—an increase of 150,342 contos or approximately 3.8 per cent. There was a slightly larger increase in tonnage, this being 4.6 per cent. Exports, in tons of 2200 pounds, were 1,919,201 in 1925 and 1,834,859 in 1924. Imports in 1925 were valued at 3,431,058 contos, compared with 2,789,558 contos in 1924, an increase of 641,500 contos or 23 per cent. Imports by quantity were 4,427,560 tons in 1924 and 4,843,513 in 1925, an increase of 9.4 per cent. The movement of trade during the past five years, in quantity and value, follows:

BRAZILIAN FOREIGN TRADE

Year	1,000 tons		Contos	
	Imports	Exports	Imports	Exports
1921.....	2,578	1,919	1,689,839	1,709,722
1922.....	3,264	2,122	1,652,630	2,382,084
1923.....	3,576	2,229	2,267,159	2,297,033
1924.....	4,428	1,885	2,789,557	3,863,554
1925.....	4,844	1,919	3,431,058	4,013,896

The tendency during recent years has been for a greater expansion of imports. Exports have increased, though only in value, and that can be accounted for by higher coffee prices. Exports of coffee in 1925 were smaller, in quantity and value, than in 1924. Exports in 1925 were 13,480,000 bags valued at 2,899,587 contos, compared with 14,266,000 bags in 1924 valued at 2,928,572 contos. The average value of a bag of coffee exported in 1925 was 215 milreis, against 206 milreis in 1924, although in dollars these values were approximately \$25 and \$22, respectively, the rate of exchange being 8.314 in 1925 and 9.181 in 1924. In 1925, coffee accounted for

72.2 per cent of the total exports. The Brazilian export trade during 1925 was marked by radical changes in leading exports, and the following table shows the quantity and value of the 13 leading products for 1924 and 1925:

## PRINCIPAL EXPORTS FROM BRAZIL

Item	Quantity		Value	
	1924 1,000 bags	1925 1,000 bags	1924 Contos	1925 Contos
Coffee .....	14,226	13,480	2,928,572	2,899,587
Rubber .....	21,568	23,537	79,212	191,803
Cotton .....	6,464	30,271	38,989	124,494
Hides .....	52,048	55,660	103,290	116,982
Yerba mate .....	78,750	86,540	87,952	107,277
Cacao .....	68,874	64,544	98,174	99,862
Tobacco .....	29,586	34,914	74,796	90,827
Oilseeds .....	96,791	85,348	100,676	75,368
Frozen and chilled meats .....	75,312	57,077	88,575	70,334
Skins .....	3,253	3,366	35,975	34,152
Manganese .....	159,229	311,882	18,258	31,476
Timber .....	150,072	130,458	29,828	27,172
Sugar .....	34,466	3,182	30,276	2,258

Coffee continued to be the leading item of export, although it showed a decrease of approximately one per cent in value and five per cent in quantity. Rubber returned to second place as an important export after an absence of 13 years, the 1925 figure being 191,803 contos, the largest since 1912, when exports were valued at 241,425 contos. The increase over 1924 in quantity was only 1969 tons, but value increased from 79,212 contos to 191,803, or approximately 142 per cent. The average export value per ton of rubber in 1925 was 8149 milreis, compared with 3673 milreis in 1924.

Following rubber, was cotton, exports of which increased 200 per cent in value during 1925, compared with 1924. This tremendous increase may be accounted for by the severe industrial and credit depression that existed in Brazil during the latter part of 1925. The textile industry was especially affected, the mills having large stocks of raw materials on hand and no market for the product, were forced to curtail purchases, and shipments of raw cotton were sent abroad. Cotton prices dropped considerably in 1925, an export ton being quoted at 4113 milreis, compared with 6031 milreis in 1924. Other important export commodities showing increase in 1925 were hides, yerba mate, cacao, tobacco, and manganese. Oilseeds ranked third in value in 1924, but in 1925 were reduced to eighth place, the decrease being from 100,676 contos to 75,363 contos. Exports of frozen and chilled meats fell off, as did skins, timber, and sugar. In the case of the latter, 1925 exports were only 2258 contos, while in 1924 the figure was 30,276 contos, a decrease of 92 per cent.

The 1925 trade of the port of Santos totaled 3,478,787,842 milreis, compared with 3,095,329,981 milreis in 1924—an increase of 383,394,861 milreis, or 12 per cent. The magnitude of this trade is better realized when it is known that of Brazil's entire 1925 trade of 7,444,954,000 milreis, Santos contributed 46.7 per cent. Coffee exports from that port were responsible for 2,075,165,985 milreis, or over half of the total export and import trade in 1925. Total exports during 1925 were 2,192,149 contos, compared with 2,125,597 contos in 1924, an increase of 9 per cent. The largest export commodity was, as usual, coffee, its value in 1925 being 2,075,165 contos, compared with 2,030,985 contos in

1924. Bags of coffee exported decreased in 1925, being 9,101,065 compared with 9,505,808 in 1924. The leading exports and their values for 1924 and 1925 are given below:

PRINCIPAL EXPORTS FROM SANTOS  
[Value in milreis]

Item	1924	1925
Raw cotton .....	4,758,336	45,496,967
Hides .....	5,458,252	7,831,445
Oilseeds .....	5,666,714	4,655,214
Coffee .....	2,080,985,531	2,075,165,985
Frozen and chilled meats	49,765,215	32,148,963
Bananas .....	15,358,706	10,627,068
Cottonseed-oil cakes .....	4,195,955	6,612,616

Total .....

FINANCE. Undoubtedly one of the questions which of late years has most interested bankers, business men, and investors who follow developments in Latin America has been that connected with the efforts of Brazil to emerge from the disordered financial conditions of the war and postwar years. Since 1914, as is generally known, the industries and the internal trade of Brazil have expanded notably; new productive regions have been brought into development; and the entire economic equipment of the country has been enlarged and placed on a firmer basis than ever before. Such national expansion, under the circumstances of those abnormal years, put a certain strain on the financial capacity of the country. The reaction upon the federal treasury was seen in annual deficits of really alarming proportions. The succession of unbalanced budgets and issues of depreciating paper money finally brought conditions to a point where it was generally realized that only the most adroit and vigorous management of public affairs could effect a reform. Fortunately, much progress has been made during the past three years in effecting economies, increasing revenues, and reducing inflation. The gradual financial improvement during the past three years is shown in the following table of revenues and expenditures:

BRAZILIAN REVENUES AND EXPENDITURES  
[In contos of reis<sup>a</sup>]

Items	1922	1923	1924	1925
Gold:				
Revenues ..	75,397	98,901	131,686	158,039
Expenditures	83,767	86,730	88,923	80,624
Paper:				
Revenues ..	653,475	742,243	946,602	1,018,189
Expenditures	1,074,180	1,021,385	1,229,667	1,366,163
Net deficit in terms of paper	448,952	224,373	90,631	<sup>b</sup> 340

<sup>a</sup> 1 conto = 1,000 milreis. 1 gold conto = \$546. 1 paper conto = about \$145 at present exchange rates.

<sup>b</sup> Surplus.

The reduction and final elimination of the deficit are due to rigid adherence to the programme announced by President Bernardes when he took office in 1922. The task was extremely difficult, for it was necessary to overcome established official customs, reduce allowances, deny urgent demands for appropriations, levy new taxes, and introduce more rigorous methods in the collection of revenues. The results of 1922 are indicative of the conditions faced by the new administration. The effort to balance the budget was not successful in 1923. New taxes were assessed on mercantile sales and on general income, the expenditures on public works were restricted, and administrative procedure was improved. It was necessary, however, to devote

large sums to pending obligations, to the service of the floating debt, and to the payment of provisional bonuses to public employees. Appreciable progress was made in 1924, and had it not been for the expenditures necessitated by the revolutionary disturbances of that year, a surplus might have been realized. Revenues gained considerably, in large measure attributable to the improved organization of the treasury. The results of 1925 may be considered gratifying, since the country experienced a rather trying commercial depression and financial stringency in that year.

The Congress passed the estimates of revenue for 1926, but failed to act on the appropriations for expenditures; therefore, the latter were automatically extended from 1925. The final form of the budget for 1926, as promulgated on January 2, was as follows:

## BRAZILIAN BUDGET FOR 1926

	Gold	Paper	Total
	Contos	Contos	Contos
Revenue .....	121,646	1,097,716	1,566,917
Expenditure .....	84,413	1,044,599	1,370,188
Surplus .....	37,233	53,117	196,729

There had been little recent movement in the external funded debt of the Federal Government, no new loans having been contracted in 1923, 1924, or 1925. The foreign debt at the end of 1925, as given in the annual message of the president, was composed of obligations totaling £102,529,944, 336,548,500 French francs, and \$63,717,167. The reductions effected during the year amounted to £93,350, 59,000 francs, and \$3,333,333. The internal funded debt increased from 1,541,000 contos at the end of 1922 to 2,137,424 at the end of 1925. The new issues were largely for railroad acquisition and improvements, irrigation, and other public works.

COMMUNICATIONS. The president in his message to Congress on May 3, 1926, gave statistics concerning both shipping and railroads. For the years 1923 to 1925, 83,857 vessels of 97,912,177 tons had entered the ports of Brazil. The amount of freight carried by the ships entering Brazilian ports in 1923 was 7,039,555 metric tons; in 1924, 7,969,726 tons; and in 1925, 8,522,769 tons. He stated that on Dec. 31, 1925, the length of railways in Brazil was 30,636 kilometers. The following new sections were opened to traffic in 1925:

	Railroad	Length Kilometers
Ingazeiras to Missão Velha .....	Baturité .....	25
Baratinha to São Carvalho .....	Victoria-Minas .....	16
São José dos Campos extension .....	Central of Brazil .....	6
Cabralia to Duartina .....	São Paulo .....	12
On Pirajuby Branch .....	Northwest of Brazil ..	10
Carmo de Cachoeira to Cerro .....	Minas Southern .....	15
Indayá to Mello Vianna .....	Paracatu .....	22
Alfenas to Cayanna .....	Machadense .....	25
Alto da Serra to Jussaraí .....	Minas Western .....	16
Ibiá to Presidente Bernardes .....	Minas Western .....	33
Uberaba to A. Campos .....	Minas Western .....	83
Pinhalão to Arthur Bernardes .....	São Paulo-Rio Grande ..	26
Esplanada to Caeté .....	Dona Theresa Christina ..	30
On Brazilio to Jaguarão Branch .....	Rio Grande do Sul ...	16

The lines owned by the Federal Government are 17,957 kilometers in length; of these, 8726 kilometers are directly administered by the government, the balance being rented. An extension of 5310 kilometers of track is operated under concession from the Federal Government, 7369 kilometers are either owned by the states or operated under concessions from them. In October the Ministry of Transportation was reported to be considering the electrification of the Central do Brazil, work to commence before the end of 1926. The work of electrification was to be commenced in the suburban district of Rio de Janeiro, and be carried out for a distance of about 40 miles. The electrification was to be financed by the national treasury. When the project was first considered in 1922, bids were offered by two American firms, and by two British construction companies, but were rejected by the government.

GOVERNMENT. The executive power is vested in the president, who with the vice-president is elected directly by the people for four years and is ineligible for reelection; and the legislative power in the National Congress which consists of the Chamber of Deputies and the Senate, the former having 212 members elected for three years by direct popular vote on the basis of minority representation, and the latter 63 members elected by direct vote for nine years, one-third being renewed every three years. The president at the beginning of 1926 was Dr. Arturo da Silva Bernardes, elected Mar. 1, 1922.

HISTORY. The Brazilian Congress opened its session on May 3 and in his message to it Pres. Arturo Bernardes spent practically all his time in going over the improvements that had taken place during 1925. He stressed very strongly the fact that for the first time since 1907 the budget had been balanced, and a surplus had remained. He stated it was only by means of a most rigorous campaign of economy that the above results were achieved despite the depreciation of the paper currency. He advocated constitutional reforms including a revision of the commercial code and the continuance in office in an unofficial capacity of the retiring officials to assist the new administration in an advisory manner. He also advocated the secret ballot and a compulsory election law, as well as the transfer of the capital from Rio de Janeiro to Goyaz in accordance with the constitutional provision making this change.

On the 15th of November, Dr. Washington Luiz Pereira de Souza assumed the office of President of Brazil, to which position he was elected in March. The new president was born in the State of Rio de Janeiro, Oct. 26, 1870. He began his advanced studies in the Colegio Pedro Segundo in the city of Rio de Janeiro in 1884, completing the course in São Paulo four years later. He matriculated in the law school of the latter city, from which he was graduated in 1891. He began the practice of law in the State of Rio de Janeiro, but, removing to Batataes in São Paulo, he took up his practice in that city, being shortly afterwards elected president of the municipal council. In 1904 he was elected to the State legislature where in 1905 he took part in the revision of the state constitution. In March, 1906, he was appointed Secretary of Justice in the administration of Dr. Jorge Tybiriçá, a position he continued to

hold during the succeeding administration under Dr. Albuquerque Lins until May, 1912, when he was again elected to the State legislature. In October, 1913, he was elected Prefect of the city of São Paulo, and in the same year he was nominated by the Republican Party of that state to succeed Dr. Altino Arantes as Governor of that state, being elected in the following March by a large majority for the four-year period 1920-24. After this he was elected to the federal senate, from which body he was elected president. Upon his inauguration, President De Souza announced the following cabinet: Foreign Affairs, Octavio Mangabeira; Finance, Dr. Getulio Vargas; Agriculture, Lyra Castro; Public Works, Dr. Victor Kondor; Justice and Interior, Dr. Vianna da Castello; Marine, Admiral Pinto da Luz; War, General Nestor dos Passos.

At his inaugural President De Souza promised to stabilize the milreis at a slightly lower rate than that proposed by his predecessor; the continuance of the policy of road construction throughout Brazil; and immediate relief from the existing coal shortage. Almost as soon as the new president was inducted into office he was met with a mutiny of some troops in the state of Rio Grande do Sul. He sent troops to suppress the rebellion and continued the state of siege, with the censorship of the press, etc., which had been enforced by President Bernardes. The mutiny took on the aspects of a rebellion when it spread to the states of Paraná and Santa Catalina. The press reported a number of successes for the revolutionists towards the end of November and in early December.

For the resignation of Brazil from the League of Nations, consult article on LEAGUE OF NATIONS.

**BREED, RICHARD EDWARDS.** American operator and organizer of public utilities, died at New York City, October 14. He was born at Pittsburgh, Pa., Mar. 17, 1866, and was educated at the University of Kentucky. He early became connected with various public utilities and organized the American Gas and Electric Company of which he became president, and at the time of his death was chairman of the board. He was also a director and member of the executive committee of the American Power and Light Company, of the Electric Power and Light Corporation, and of the Carolina Power & Light Company, as well as being a director of the Wheeling Bank and Trust Company, and many other corporations. He served on the staff of three governors of Indiana and was known as General Breed through rank thus acquired. He went to New York about 1906 and was identified with the control of various power developments and public utility organizations which had their headquarters in that city.

**BREIL, JOSEPH CARL.** An American composer, died at Los Angeles, January 23. He was born in Pittsburgh, Pa., June 29, 1870. While studying law and philosophy at the University of Leipzig, he at the same time pursued his musical studies at the Conservatory there. He began his career as a tenor with the Emma Juch Opera Company in New York (1891-92) and then lived in Pittsburgh (1892-97) as tenor soloist and choirmaster at St. Paul's Cathedral. For the next six years he toured the United States as conductor of various theatrical com-

panies. His compositions consist mainly of incidental music to plays and photoplays. His music to *Queen Elizabeth* (Chicago, 1912) is the first score written specially for a motion picture production. He also wrote a *Requiem*, two masses and a *Vesper Service*. His only serious opera, *The Legend*, was produced at the Metropolitan Opera House in 1919.

**BRETHREN, CHURCH OF THE.** A church established in the United States in 1719 at Germantown, Pa. It originated in Schwarzenau, Germany in 1708, and is the largest of the five branches of the denomination formerly known as the German Baptist Brethren or "Dunkers." Other churches of this group are: The Church of God (New Dunkards); Brethren Church (Progressive Dunkers); German Seventh Day Baptists, and Old Order German Baptist Brethren. The polity of the Church of the Brethren corresponds more nearly to the Presbyterian than to any other specific ecclesiastical form. It comprises 50 district conferences and holds a General Conference annually. Figures for 1926 showed 1033 churches and a membership of 126,711. Sunday Schools numbered 1198 and scholars 145,000. Foreign missionary work is carried on in India, China, Sweden, and Africa. The total membership in India and China was 4290 in June, 1926. Expenditures for the year ending Feb. 28, 1926 totaled \$305,949.12. Eight colleges, one academy, and one Theological Seminary and Training School are maintained by the denomination. In 1926 these had an enrollment of 3816 students. Officers of the General Conference in 1926 were: Dr. D. W. Kurtz, McPherson, Kans., moderator; J. W. Lear, Chicago, reading clerk; and I. B. Book, North Manchester, Ind., writing clerk. Otho Winger, North Manchester, Ind., is president of the General Mission Board. The *Gospel Messenger* is the official organ of the denomination. The *Missionary Visitor* is the promotional periodical of the General Mission Board. The headquarters of the General Mission Board, General Educational Board, General Sunday School Board, General Welfare Board, and the Council of Promotion are located at Elgin, Ill.

**BRIDGES.** In 1926 there was considerable activity in bridge building and design due in large measure to the increased use and development of highways and the necessity for their crossing bodies of water often of considerable width. In other words, the highway bridge of long span had become more important than the railway bridge, and with the heavy traffic on the more important highways and the heavier weights of motor vehicles, both busses and trucks, the design of such bridges had become a matter of no small importance. At or in the vicinity of large cities where a number of highways radiated from business centres into the surrounding country, this matter in many cases had become one of prime necessity, and the success of such recent structures as the Delaware River Bridge between Philadelphia and Camden demonstrated that similar provision could be made with advantage at other cities. Furthermore, where there were direct highways, and this applied not only to the populous districts in the vicinity of the larger cities but to long distance traffic routes, it was considered desirable to eliminate ferries or detours and, accordingly, a number of private toll bridges were proposed under special acts of State legis-

latures. In many cases this gave rise to the discussion as to the applicability of Federal aid to roads where toll bridges were elements of the route, and the Federal government, as was expressed in an opinion by Controller McCarl, claimed that it was in violation of the Federal-aid road act. On the other hand in some States the need of such conveniences on key routes of travel was so pressing, and there was a disinclination of State legislatures to incur a bonded indebtedness for their construction, that private projects met with encouragement, particularly where after a term of years the charter permitted the State to take over the project. The American Association of State Highway Officials at a meeting held in the autumn of 1926 adopted resolutions strongly opposing privately owned toll bridges.

**FIFTY YEARS' PROGRESS IN BRIDGE BUILDING.** Among the interesting papers presented at the Annual Convention of the American Society of Civil Engineers, held at Philadelphia from October 4 to 9, was one by Ralph Modjeski, engineer of the Delaware River Bridge, who spoke on "Fifty Years' Progress in Bridge Building." Using a historical review as a background to discuss the choice of form and design in the planning of the Delaware River Bridge, Mr. Modjeski referred to the better protection for men in the construction of deep foundations, the improvement of erection machinery, the use of alloy steels, and the development of knowledge and theory in actual design. Bridge building in large measure had utilized alloy steels as they were improved, and in many of the more notable structures a new type of alloy was employed as they were built. In the Eads Bridge chrome steel was used, for the Manhattan, Quebec, Metropolis, and Hell Gate Bridges, nickel steel, for the Memphis Bridge, Mayari steel, and finally the more recent but less strong material, silicon steel, which was employed in a considerable number of bridges.

As a result of earlier experience and studies, in the Delaware River Bridge nickel steel was used in the chords of the stiffening trusses and silicon steel in the webs of the trusses and in the main towers. The Delaware suspension bridge presented a marked contrast with the Brooklyn Bridge of fifty years previous, and Mr. Modjeski referred to the improvements adopted and also to the fact that the suspension bridge now was the predominant type for long spans. Among the changes in this period were the substitution of fixed saddles for roller-mount saddles, the elimination of expansion joints in the trusses, except in the form of rockers at the towers, the replacement of fixed stone towers by flexible steel towers, the elimination of top bracing, and finally the use of two cables in place of four, so as to afford a clear roadway.

**HUDSON RIVER BRIDGE.** During the year 1926 the Port of New York Authority, a body created by compact between the States of New York and New Jersey and ratified by Congress, had under way an important programme of bridge construction. Under the direction of O. H. Ammann, its bridge engineer, plans were developed for the construction of the Hudson River Bridge between Fort Washington on Manhattan Island and Fort Lee in New Jersey, which later received the approval of the U. S. War Department. Preliminary studies were made for this bridge through appropriations by the two States

amounting to \$200,000, which became available on July 1, 1925. As a result of these studies, it was revealed that there was an urgent demand for a bridge crossing for vehicular traffic and that the general location of the bridge between the points named was well chosen. Also, it was found that the bridge would have to be a single river span of at least 3500 feet, with a clear height above water of about 200 feet, and with its piers located within pier-headlines as established by the U. S. War Department. It was found that such a bridge would have to be of the suspension type, as the most economical and aesthetically fitting to the location and the special needs developed. Preliminary studies were made of a suspension bridge of simple construction and so planned that, built with a minimum initial expenditure, it could be enlarged as to its capacity as the traffic volume increased. Such a bridge could be opened for highway traffic, it was estimated, at a cost of \$50,000,000. Later it could be enlarged at an additional cost of between \$15,000,000 and \$25,000,000, when the vehicular and passenger traffic would have grown in volume to pay for such additional cost.

The elaborate studies made of the available traffic across the Hudson River clearly indicated the future success of the bridge, while an elaborate consideration of locations reduced the available sites to three in number, of which the one at 179th Street, Manhattan, was found to be the most economical, not only as regards construction, but also the most desirable with respect to approach grades, street connections, and natural setting. On this basis, after a study of other types of bridges and a consideration of borings, a tentative design was developed with a central span of 3500 feet between centres of piers or towers, or twice the span of the Philadelphia-Camden Bridge, the longest suspension bridge built up to that time. On the New Jersey side the rock cliffs of the Palisades were to form a natural abutment and anchorage, and on the New York side a side span of approximately 700 feet was planned, which would make a symmetrical arrangement. The clear height of the bridge floor above water was approximately 200 feet, so that a height ample to permit the passage of the largest vessels was secured.

The general form of the suspension bridge as planned was one of extreme simplicity, with the floor deck suspended throughout its length from simple cables or chains that later would pass over the two towers and be firmly anchored in rock or massive concrete blocks. These cables, which would have a comparatively small sag or flat catenary, would be either of steel wires or high-grade steel eyebars. Both of these types of construction have been carried on effectively in American-designed suspension bridges. For the towers, two essentially different types were designed, one of which was entirely of steel, somewhat similar to the type used in the Manhattan Bridge across the East River in New York City, and the other a combined steel and masonry tower of massive appearance, as shown in the accompanying illustration. The latter received the approval of the consulting architect, Cass Gilbert, and in view of the location and monumental character of the bridge, seemed likely to be adopted.

The plans as approved called for an initial

*Courtesy of the N. Y. Port Authority*

**THE PROPOSED HUDSON RIVER SUSPENSION BRIDGE**  
**FROM THE ARCHITECT'S DRAWING**

capacity of two 24-foot roadways which would accommodate four lanes of vehicular traffic, two in each direction. Two footwalks for pedestrians also were provided. These two roadways, it was estimated, would be sufficient to fill the demand of highway traffic for about ten years after the opening of the bridge. Later another four-lane roadway would be added and used for truck traffic, while the two initial roadways were reserved for passenger vehicles, the eight lanes together being ample to provide for all vehicular traffic which would desire to use this crossing. The highway traffic would be accommodated on the upper deck of the structure, while on the lower deck would be added two or four tracks for rail traffic, as might be found necessary. In addition to the suspension bridge proper and its engineering elements, the approaches were planned appropriate to the surroundings, that on the New York side crossing Riverside Drive with an accommodated arrangement of roadways of ramps, and a plaza of considerable size between Fort Washington Avenue and Broadway. On the New Jersey side the bridge would be approached through a cut spanned by a great arch and carrying a foot-walk along the top of the Palisades.

With the approval of the U. S. War Department duly granted, a \$20,000,000 issue of 4 per cent bonds made jointly by the State of New York and the State of New Jersey for the construction of this bridge by the Port of New York Authority, was sold, and it was stated that physical construction of the new bridge would begin in 1927, so that it could be opened to traffic in 1932. It would require five years additional to bring the bridge up to its maximum capacity.

**STATEN ISLAND-NEW JERSEY BRIDGES.** More modest than the proposed Hudson River Bridge were two bridges connecting Staten Island with New Jersey, which were put under way during the year by the Port Authority to span Arthur Kill. Both of these bridges were planned to accommodate highway traffic only, carrying on a single deck a four-lane vehicular roadway and two 5-foot sidewalks. These were to be toll bridges and at each end there would be plazas with space for toll booths. The first of these bridges, known as the Outerbridge Crossing, named after Eugene H. Outerbridge, who was for many years chairman of the Port Authority, extends from Francis Street in Perth Amboy, N. J., to about 1400 feet east of Arthur Kill Road in Tottenville, S. I., a total length of about 10,200 feet. Arthur Kill was to be crossed by a high-level cantilever bridge 1500 feet long, with a centre span of 750 feet and a clear height above water of 105 feet. The cantilever is flanked by two 300-foot truss spans. The steel trusses of the main river bridge were to be carried by arched concrete piers and the pier bases were to rest on timber piles. The approaches on either end were to consist of plate girder spans supported by arched concrete piers resting partly on timber piles, partly on reinforced concrete piles, and partly on spread footings. The estimated cost of this bridge was \$10,000,000.

The Elizabeth-Howland Hook Bridge, the second of the Arthur Kill crossings, extends from Edith Avenue, Elizabeth, to McKinley Avenue in Howland Hook. Arthur Kill is crossed by a high-level cantilever truss bridge 1152 feet long, with a centre span of 672 feet and a clear

height of 135 feet. The approaches consist of plate girder spans, all spans being supported by arched concrete piers, as is the case also in the Outerbridge Crossing. The cost of this bridge was estimated at approximately \$7,000,000. The designs and specifications for both bridges were prepared by Dr. J. A. L. Waddell, with Shortridge Hardesty as associate engineer in general charge. O. H. Ammann, the bridge engineer of the Port Authority, was in general charge of the engineering work, while Prof. William H. Burr, and Gen. George W. Goethals, in addition to Dr. Waddell, were acting as consulting engineers.

**DELAWARE RIVER BRIDGE.** The Delaware River Bridge between Philadelphia and Camden, which has been discussed in earlier issues of the *YEAR BOOK* (see *YEAR BOOK* for 1921, 1922, 1923, 1924, 1925), was formally opened on July 4. This was the world's largest suspension bridge and was operated as a toll bridge, being considered the largest public toll enterprise ever built. It was interesting to note that the bridge was completed for regular traffic three days earlier than the date promised in the engineer's preliminary report written a year before construction began, early in 1921. It has a clear span between pier headlines corresponding to a spacing of main piers of 1750 feet, and a gross height of 135 feet. The bridge had a six-lane roadway 57 feet wide, with space for four tracks for street cars or rapid transit tracks, and two 10-foot walks, the cables being spaced 89 feet apart. The actual cost of the bridge was \$36,300,000, which was 12 per cent greater in construction and 70 per cent greater in land than was originally estimated.

From the statistics derived from the early months of operation of the bridge, it was estimated that with the adopted toll rate of 25 cents per vehicle, the whole cost of the bridge would be retired in less than 15 years. In the four months, July 2 to Nov. 1, 1926, the toll collections amounted to \$806,427, the monthly figures being \$226,485; \$219,518; \$177,097; and \$183,326. About three-fourths of this income was derived from private passenger automobiles, from which a toll rate of 25 cents was received, while the remainder was truck and passenger bus traffic. An interesting descriptive summary of this bridge appeared in the *Engineering News-Record* for Sept. 30, 1926 (page 530) and Oct. 7, 1926 (page 578).

**NEWARK BAY RAILROAD BRIDGE.** On Nov. 28, 1926, the four-track bridge of the Central Railroad of New Jersey over Newark Bay between Bayonne and Elizabeth, N. J., described in the *YEAR BOOK* for 1925, was put into service. This bridge, which involved a cost of \$10,000,000, accommodated four tracks and consisted of an east approach viaduct, two sets of twin double track vertical lift spans 305 and 216½ feet in length, and 41 deck plate girder spans 124½ feet long, making a total length of 7411 feet. The entire project, involving the bridge, the approach, grade crossing elimination, and necessary changes in track alignment, brought the total cost of the operations to about \$15,000,000. The bridge was designed to replace the low level trestle crossing the Bay, and the new draw spans have an under-clearance of 35 feet at low water, and of 135 feet with the lift spans open.

**PITTSBURGH, PA., BRIDGES.** During the year rapid progress was made on the erection of the

three self-anchored suspension bridges across the Allegheny River at Pittsburgh referred to in the YEAR BOOK for 1924. The Seventh Street Bridge, the first of the group, was opened to traffic on June 17, and the Ninth Street Bridge, where steel erection began on March 1, had its span joined at the centre October 6, and was practically completed at the end of the year. The third, or Sixth Street Bridge, was to be erected in 1927. This group of bridges was of interest in that cantilever erection was used in the construction, so as to avoid false work in the channel, and each half was built as a cantilever with temporary diagonal struts between the chains and stiffening gear.

**SAN FRANCISCO BAY BRIDGE PROJECTS.** During the year a series of hearings on various projects to provide crossing for San Francisco Bay were held and brought out a number of projects and an elaborate discussion. The San Francisco Board of Supervisors voted on October 4 to employ "three bridge engineers of established reputation, not affiliated with any project asking a franchise, to study the problem of bridging the Bay and to make such investigations and compile such engineering data and information as may be essential to enable this Board and the people of San Francisco to determine the best type and location of a bridge to serve the interests of the community." The development of a satisfactory bridge crossing for San Francisco Bay was naturally an engineering project of first importance, and a franchise from the Supervisors was not merely sufficient in the matter, but the approval of the U. S. War Department had to be obtained, which, in action taken in 1921 and referred to in previous issues of the YEAR BOOK, was opposed to any high-level bridge to be constructed north of Hunter's Point.

It was thought during the hearings held in September and October of 1926 that the San Francisco Supervisors favored a bridge with provision for handling steam railroad traffic, while the city of Oakland wanted the East Bay Railroad Terminals left undisturbed. A vehicular bridge crossing the Bay, if adapted to accommodate steam railway operation, would involve an increased cost of some twenty-five millions of dollars. By the 1st of November some 19 different projects were placed before the Board for consideration, with applications for franchise. Various locations were suggested, as well as types of bridge which would vary in length and would have a clear height of from 135 feet to 200 feet above the water level. Up to the end of the year no definite decision had been reached in this important development, which was still a subject of considerable difference of opinion. Earlier in the year the U. S. Navy had expressed its official opposition to a bridge north of Hunter's Point because it would restrict ship and naval operations in San Francisco Bay, while during war the wrecking of such a structure by bombs or otherwise might bottle up naval forces and commercial shipping in the harbor, such shipping possibly including a full fleet. Likewise, if the fleet were at sea, it might become impossible for it to enter San Francisco Bay, so that the Navy would be deprived of a most essential Pacific Coast base. The matter was of further importance because San Francisco Bay and Puget Sound are the only protected bases on the

Pacific Coast which a fleet could use during war for refueling, refitting and operation.

**ST. PAUL AND MINNEAPOLIS BRIDGES.** During the year four concrete arch bridges were under construction in and near the cities of St. Paul and Minneapolis, Minn. These represented modern ideas in reinforced concrete construction, though there was considerable diversity in general design and capacity. The new structures included the Robert Street Bridge across the Mississippi River at St. Paul, the Inter-city Bridge, also across the Mississippi River, connecting Ford Avenue, St. Paul, and 46th Avenue, Minneapolis, the Cedar Street Bridge across the Mississippi River at Minneapolis, and the Fort Snelling-Mendota Bridge across the valley of the Minnesota River, carrying the State highway. Previously there had been built at Minneapolis the Cappelen Bridge at Franklin Avenue, with a 400-foot main arch flanked on either side by one of 199 feet and one of 55½ feet, with a total length between abutments of 1032 feet, and the Third Avenue Bridge with seven arches of 211-foot span and two of 134 feet.

**ROBERT STREET BRIDGE, ST. PAUL, MINN.** A notable structure at St. Paul, Minn., was opened for traffic Aug. 6, 1926, when the new Robert Street Bridge across the Mississippi River, built at a cost of \$1,800,000, came into use to replace the steel bridge built in 1881, but which was deficient in capacity. The new bridge was a reinforced concrete arch structure with a 56-foot clear roadway and two 10-foot sidewalks, the bridge being the full width of the street, as against 32 feet between curbs and two sidewalks 8½ feet wide of the old bridge which was replaced. The engineering and architectural design of the new structure presented many interesting features, particularly as it consisted of a 264-foot channel span which was flanked by approach spans where the location of nearly every pier was determined by existing structures and railroad property. Also, the two ends of the bridge were conditioned by the existing grades of the street, while the government required a clearance of 47 feet above ordinary high water. The total length of the bridge, including approaches, was approximately 1900 feet, and the structure included at the north end a reinforced concrete trestle with three spans of varying length, 89 feet in the aggregate, a skew steel-deck girder span of about 53 feet, three flat-barrel arches with a combined length of about 291 feet, a two-rib arch span of 264 feet centre to centre of piers crossing the main channel, and four five-rib arch spans totaling 514 feet, with a 311-foot concrete trestle on concrete piles with eight spans, and finally 260 feet of earth fill between buildings, and concrete retaining walls. The chief feature of interest was the 264-foot through-arch span, which was 244 feet in the clear between piers. This was required as the government demanded 62 feet headroom above low water for a skew channel width of 160 feet, or 180 feet along the bridge.

*Inter-city Bridge, St. Paul-Minneapolis.* The Inter-city Bridge had five arches of the rib type, three of 300-foot and two of 139-foot span. It was 1516 feet between abutments and had a width of 63 feet. The roadway was 100 feet above water and its estimated cost was \$1,322,984.

*Cedar Street Bridge, Minneapolis.* This bridge had been designed with seven arch spans of the

two-rib type, two with clear spans of 205½ feet and five of 93 feet. The total length of the river portion of the bridge between abutments was 1146 feet, while the concrete viaduct approaches would make the total length 2921 feet. The roadway was 112 feet above water and the width between parapets was 56 feet. The estimated cost of this bridge was \$1,076,000.

**Fort Snelling-Mendota Bridge.** A long concrete arch bridge carrying a State Highway across the valley of the Minnesota River between Fort Snelling and Mendota, Minn., was nearing completion at the end of the year at an estimated cost of \$1,870,000. See YEAR BOOK for 1924. This bridge consisted of 13 open spandrel two-rib arches 304 feet centre to centre, each with a clear span of 283 feet 4 inches, with a short slab approach affording a total length of 4119 feet. The roadway was 120 feet above water, while the foundations extended to solid rock an average depth of about 80 feet below ground level.

**GALLIPOLIS SUSPENSION BRIDGE, OHIO RIVER.** Late in the year the Gallia County Ohio River Bridge Company started work on a suspension bridge with a 700-foot span between Kanauga, a suburb of Gallipolis, Ohio, and Point Pleasant, West Virginia, forming a link in the direct route between Columbus, Ohio and Charleston, West Virginia. The project was to have a paved roadway 28 feet in width and also one 4-foot sidewalk.

**DULUTH-SUPERIOR TOLL BRIDGE.** The need of improved highway communication on various routes throughout the United States was again emphasized in the Duluth-Superior Toll Bridge between the cities of Duluth, Minn., and Superior, Wis., which was under construction during the year. This interstate bridge was being built for the Arrowhead Bridge Company and involved a structure with approaches 3000 feet in length, of which 2000 feet were timber piles. There was a movable span with a double-leaf deck bascule of the Scherzer rolling-lift type which afforded a clear channel width of 227 feet. The span between the end bearings was 240 feet and the over-all length of the structure was 294 feet. This lift-span provided a 24-foot roadway and one 4-foot sidewalk. It was operated by two 25 h.p. motors for each lift, capable of raising the parts in 1½ minutes against the maximum resistance. An emergency equipment consisting of a 75 h.p. gasoline motor direct-connected to a generator was supplied in case of failure of current.

**ILLINOIS RIVER BRIDGE AT FLORENCE.** During the year the Illinois State Division of Highways, after a competition among four designers for double bridges, adopted a design calling for a vertical lift bridge of the Strauss type. In this arrangement the operation of the span is effected by a rack and pinion at each end and counterweights attached to cables leading over sheaves on top of the steel towers. This movable span is of the through-truss type, 215 feet from centre to centre of end spans. On either side there were four fixed spans of the same type and length, total length between abutments being 1950 feet. For the middle spans the clear headroom was 8½ feet at high water and 28½ feet at low water, the former reducing to 7 feet at the abutments. The lift span provides a clear channel width of 206½ feet and a headroom of 65 feet above high water level when

raised. The bridge is carried by concrete piers and will have a reinforced concrete floor 24 feet wide.

**NEW ORLEANS BRIDGE.** During the year contract drawings were prepared for the proposed Mississippi River crossing about 6 miles north of New Orleans. The general layout of this bridge received the approval of the U. S. War Department in June, 1925, and the bridge, as outlined, was to consist of a central span 790 feet, two anchor arms each 530 feet, and two flanking spans at each side 532 and 333 feet respectively centre to centre of piers, making a total length of main bridge of 3580 feet. A clearance of 130 feet above the main Gulf level was required. The approaches were to be approximately 1¾ miles long on each side of the river, and the bridge was to carry a double track railway and two 18-foot roadways on cantilever brackets outside of the trusses. The work was under the auspices of the Public Belt Railroad Commission of New Orleans, and was under the supervision of Ralph Modjeski, chief engineer, and a board of advisory engineers consisting of Daniel E. Moran and Howard C. Baird of New York City and A. F. Barclay of New Orleans.

**LAKE PONTCHARTRAIN BRIDGE, NEW ORLEANS.** An important work involving 5 miles of reinforced concrete trestle and two bascule spans formed the subject of a contract awarded during the year for the toll highway bridge over Lake Pontchartrain, near New Orleans, La. The bridge and its approaches were designed with a total length of about 15 miles, forming a link in the highway system, so that the bridge would cross the lake at its narrows from Pointe aux Herbes to near Slidell, being parallel to and about one-half mile east of the timber trestle crossing of the Southern Railway. A 20-foot roadway would be carried on a concrete trestle of 35-foot spans and there would be two double lift bascule draw spans over the ship channel. This new project would give New Orleans a direct highway exit to the East without recourse to ferries. Whether a bridge over Lake Pontchartrain should be free or a privately owned toll bridge was, during the year, a subject of controversy.

**PORTLAND, OREGON.** The tendency of modern bridge construction in the United States was shown in the replacement of the steel viaduct on Vista Avenue, over Jefferson Street Canyon, at Portland, Ore., which was built in 1905, by a reinforced concrete arch bridge with a span of 248 feet. This replacement was necessary not only on account of the 33-foot roadway of the old viaduct being too narrow to handle the traffic, but on account of the noise of the timber deck and plank roadway. The new construction was effected without diverting the street car line from the older viaduct, although vehicular traffic was routed over other streets. The arch span of the new bridge had a rise of 50 feet above the spring line, and a deck width of 52 feet provided for a 38-foot roadway with two 6-foot sidewalks. There was no exposed steel on the bridge, and bronze was used for trolley poles and lighting standards.

The Ross Avenue Bridge across the Willamette River at Portland, Ore., was nearing completion at the end of the year. This was a steel arch bridge where a central steel span 535 feet in length was flanked on either side by a 321-

foot span continuous with the arch over the main piers. An interesting feature of this construction was the closure of the central steel arch without the use of jacks, the movement of 2½ inches at the crown being made by taking advantage of the daily temperature changes. The erection of this bridge was effected by cantilevering out from both approaches, as falsework was impossible on account of the necessity of leaving a clear channel.

**UNITED STATES BRIDGES LISTED.** During the year the Corps of Engineers, U. S. Army, published a list of bridges over the navigable waters of the United States, in which more than 5000 bridges were included. With each bridge was given the name of the river, distance of the bridge from the mouth of the river, the owner, kind and number of spans, clearance through channel spans, date the structure was approved by the Federal Government, date of completion, purpose for which the bridge was used, and the time during which the drawbridges will remain closed. A limited number of copies were prepared, to serve as the basis of a general edition after the work had been checked.

**LONDON BRIDGES.** The Royal Commission on Cross-River Traffic in London presented a report dated November 30, which contained a comprehensive survey of the question of cross-river communication in London, dealing with the construction of new bridges, the demolition of obsolete or obsolescent structures, and the rebuilding of such as were capable of improvement. The Commission recommended that Waterloo Bridge should not be demolished, but that four piers and the arches supported by them should be rebuilt and the foundations of the remainder supplied with new underpinning. The roadway of the bridge should be widened to 35 feet, without diminishing the present width of the footwalks. The Commission also recommended that the project for a new St. Paul's Bridge should be abandoned in favor of a new high level road bridge between Southwark Street and Holborn Viaduct, with a north and south road from Aldersgate Street to Southwark Street. A double deck steel bridge with space for six railway tracks on the lower or present level, with a 60-foot roadway above, and two footwalks of 15 feet each, was recommended for construction alongside and to the east of the present Hungerford Railway Bridge, and a new Charing Cross station should be constructed on a site bounded on the east by Buckingham Street. When the bridge and new station were ready for use the railway tracks should be switched over to them and the old bridge and station demolished, so that the site of the latter could be used for a new hotel or any other desirable development.

A recommendation was made for a new Thames tunnel from Dartford to Purfleet, a Victoria Dock road scheme, and reconstruction and improvement work on the up-river bridges. The report discussed the various bridges and their approaches and recommended their improvement and rebuilding in order to give increased capacity. The Commission recommended the establishment of a central authority for bridges and cross-river traffic, and the programme of the various improvements recommended was estimated to involve a net expenditure of £25,000,000, of which the greater part of the annual charge would fall upon the road fund and the

balance on local authorities in the London traffic area. This report was of interest as the problems of London are similar to those of other cities and the recommendations involved increasing the capacity of bridges or the construction of new bridges, rather than an extensive scheme of tunnels, but a single tunnel figuring in the complete project. The report met with a favorable reception in England, and as it was in the nature of a compromise and presented a coördinated scheme it seemed to indicate that the period of controversy had passed and that active measures could be put under way to deal with the congestion.

During the year a notable four-span reinforced concrete bridge was being constructed at Berwick across the River Tweed. This bridge was notable not only for its own design, but also because it was located between an old picturesque bridge and Stephenson's Viaduct, which for many years had been a landmark in British engineering.

**BRIGGS, EDWARD CORNELIUS.** American dentist and educator, died at Brookline, Mass., November 6. He was born at Lawrence, Mass., Sept. 6, 1856, and graduated from Harvard and Harvard Dental School in 1878, and from the School of Medicine in 1880. From 1878 he practiced dentistry in Boston and in 1880 became connected with the Harvard Dental School, being promoted through various grades to that of professor in 1895, in which capacity he served until 1915 when he became professor emeritus. He was the author of various papers on odontology and stomatology, and was a member of the American Academy of Dental Science, a member and president of the Harvard Odontological Society, of the Harvard Dental Alumni Association, and fellow of the Massachusetts Medical Society, and a member of other medical and scientific bodies.

**BRIGHAM, WILLIAM TUFTS.** American Anthropologist, died in Honolulu, January 30. He was born at Boston, Mass., May 24, 1841, and after graduating from Harvard in 1862 explored the Hawaiian Islands studying botany and geology. He was admitted to the Massachusetts bar in 1867, and in the following year became instructor in botany in Harvard College, serving until 1869. He was a member of the Boston School Board and inaugurated the system of art instruction in the public schools. He also inaugurated the Sargent method of anthropometry, which came into general use in the colleges. In 1888 he became director of the Bishop Museum of Ethnology in Honolulu, serving until 1918 when he was made curator of anthropology. In 1905 he received the honorary degree of Doctor of Science from Columbia University. In addition to being a member of many American learned societies Brigham was honorary fellow of the Royal Anthropological Institute of Great Britain and Ireland, and a member of the Imperial Academy of Sciences of St. Petersburg, and the American Academy of Arts and Sciences. His explorations and writings covered a wide range and included: *Cost Catalogue of Antique Sculpture* (1874); *Guatemala, the Land of the Quetzal* (1887); *Volcanic Manifestations in New England*; *Hawaiian Feather-work* (1899); *Index to the Islands of the Pacific Ocean*; *Stone Implements of Ancient Hawaiians*; *Mats and Baskets of the Hawaiians* (1906); *Ancient Hawaiian House* (1908); *His-*

*tory of Kilauea and Mauna Loa Hawaiian Volcanoes; Ka Hana Kapa (Bark-cloth Making) (1911); A Journey Around the World to Study Museums (1912); Feather-work, Supplement (1917.)*

**BRIGHAM YOUNG UNIVERSITY.** An institution of higher education at Provo, Utah; founded in 1875, and maintained under the auspices of the Church of Latter Day Saints. It comprises colleges of arts and sciences, education, commerce and business administration, applied science, fine arts, and the extension division. The enrollment for 1926-27 was about 1400. President, Franklin Stewart Harris, Ph.D.

**BRIGHT, JAMES WILSON.** American philologist and educator, died at Baltimore, Md., November 29. He was born at Aaronsburg, Pa., Oct. 2, 1852, and after graduating from Lafayette College in 1877 and pursuing further studies became a fellow at Johns Hopkins University in 1880, taking his Ph.D. there in 1882. He was made associate professor of English philology in Johns Hopkins in 1891, and from 1893-1905 was professor, in the latter year becoming Caroline Donovan professor of English literature. He received the degree of Litt.D. from Lafayette College in 1907, and in the same year that of LL.D. from Lake Forest. He was an active scholar, being editor-in-chief of *Modern Language Notes*, and honorary secretary for America (South and West) of the Early English Text Society, and of the Chaucer Society of London. He was a member of the Advisory board of Modern Philology, serving as its secretary from 1893-1901, and its president 1902-03. For 10 years he was a member of the Modern Language Association of America, and a member of the Simplified Spelling Board until 1918. He was vice president of the Simplified Spelling Society of London, and editor-in-chief of the Albion series of *Anglo-Saxon and Middle English Poetry*. He was the editor of *Hesperia* (Supplementary Series), and the author of many texts and reprints in Anglo-Saxon. He also wrote *Elements of English Versification* (1910).

**BRINDELL, ROBERT P.** Building trades organizer convicted of extortion in 1921, died in New York City, December 31. He was born in Quebec, Canada, in 1879, and after working in a drug store in Providence became a watchman and dock laborer in New York City. He organized the dock and pier workers and was able to secure several wage increases for these men who paid him a large fee and elected him leader for life, being at the time the highest paid labor executive. In 1919, Brindell formed the Building Trades Council, the object of which was to present a united front to contractors so that they would not have to make separate agreements with each individual craft and its representatives. At one time he was an influential figure at the American Federation of Labor conventions, but the Building Trades Council was suspended when Brindell organized a so-called "dual" union of painters in addition to the recognized union previously existing. At the time of the investigation of the housing situation in the City of New York various enterprises testified to paying Brindell sums of money for strike insurance or to facilitate contracts and permit of convenient operation. Brindell was convicted on the charge of extorting \$2000 from a builder and was sentenced to Sing Sing Prison where it was alleged he re-

ceived unusual privileges leading to his transfer to Dannemora Prison and then later to Great Meadow Prison from which he was released on parole on Dec. 26, 1924. On his return to New York it was charged that he was attempting to regain his power in the New York building trade and the Parole Board listened to testimony to that effect, but Brindell was exonerated. His death came as the result of illness contracted after his release from prison.

**BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.** An association founded in 1831, when it first met at York, England, composed of 13 sections, representing all branches of pure and applied science, with a membership of representative British scientific men and women. The annual meeting in 1926, held at Oxford, August 4-11, included full programmes of proceedings for each of the Society's component sections. The President for the Oxford Meeting, H. R. H. the Prince of Wales, K.G., F.R.S., dealt in his address with the relations between the State, the community, and scientific research. The address was given in the Sheldonian Theatre of the University to an audience which included many of the most eminent representatives of science among Americans and Europeans. Owing to the large attendance of members at the meeting, over 3700 in all, the address was relayed to two other halls in Oxford, and it was also broadcast throughout the country. Important presidential addresses were as follows: Physics and Mathematics, Prof. A. Fowler spoke on "The Analysis of Line Spectra"; Chemistry, Prof. J. F. Thorpe, on "The Scope of Organic Chemistry"; Geology, Prof. S. H. Reynolds, on "Progress in the Study of the Lower Carboniferous (Avonian) Rocks"; Zoölogy, Prof. J. Graham Kerr, on "Biology and the Training of the Citizen"; Geography, Hon. W. Ormsby-Gore, on "The Economic Development of Tropical Africa and its Effect on the Native Population"; Economics, Sir Josiah Stamp, on "Inheritance as an Economic Factor"; Engineering, Sir John F. C. Snell, on "Electricity Supply"; Anthropology, Prof. H. J. Fleure, on "The Regional Balance of Racial Evolution"; Physiology, Prof. J. B. Leathes, on "Function and Design"; Psychology, James Drever, on "Psychological Aspects of our Penal System"; Botany, Prof. F. O. Bower, on "1860-1894-1926"; Educational Science, Sir Thomas H. Holland; Agriculture, Sir Daniel Hall, on "The Relation between Cultivated Area and Population." In November announcement was made of a donation of £10,000 to the British Association for the Advancement of Science by Sir Alfred Yarrow, who made it a condition that his gift should be expended, both capital and interest, for the development of science within a period of twenty years. This gift followed a donation of the same amount made several years previously by Sir Charles Parsons. Officers elected in 1926 were: President, Prof. Sir Arthur Keith, F.R.S.; General Secretaries, Prof. J. L. Myres, O.B.E., F.S.A.; F. E. Smith, C.B., F.R.S.; General Treasurer, Dr. E. H. Griffiths, F.R.S.; Secretary, O. J. R. Howarth, O.B.E. It was decided to hold the 1927 meeting at Leeds.

**BRITISH COLUMBIA.** A Canadian province on the Pacific Ocean, lying between Alaska and Alberta. Area, 355,855 square miles; population, according to the census of 1921, 524,582

as compared with 392,480 in 1911. The principal cities and their populations in 1921; Victoria, the capital, 38,727; Vancouver, 117,217; New Westminster, 14,495. The movement of population in 1924 was: Births, 11,252; deaths, 4823; marriages, 3945. There is a complete system of free and non-sectarian education, ranging from primary to collegiate instruction. The area of the timberland of British Columbia is estimated at more than 100,000,000 acres, containing roughly 400,000,000 feet of merchantable timber. The mineral resources are abundant. The value of the mine products in 1925 was placed at \$66,526,074 by the United States Bureau of Foreign and Domestic Commerce. This represented an increase of almost \$18,000,000 over the 1924 value of \$48,704,604. The principal minerals are coal, copper, lead, gold, and silver. For figures pertaining to agriculture and manufacturing see CANADA.

The 1924-25 budget figures show a revenue of \$19,381,511 and expenditures of \$21,227,916. The government is under a lieutenant-governor and a legislative assembly of 48 members elected for five years. The province is represented in the Canadian legislature by six members in the Senate and 14 members in the House of Commons. Lieutenant-governor at the beginning of 1926, Robert R. Bruce; Prime Minister, John Oliver.

**BRITISH EAST AFRICA.** A British possession covering a large area of Africa, and comprising KENYA COLONY, UGANDA PROTECTORATE, and ZANZIBAR. See these articles.

**BRITISH GUIANA,** gē-ū'nā. A British colony on the northeastern coast of South America, including the settlements of Berbice, Demerara, and Essequibo; bounded on the north by the Atlantic Ocean, on the east by Dutch Guiana, on the south by Brazil, and on the west by Venezuela. Area, 89,480 square miles; population, according to the census of 1921, 297,691, excluding about 9700 aborigines in the remoter districts; population in 1911, 296,000. An official estimate of the population in 1924 placed it at 301,294. In the same year the movement of population was: Births, 9755; deaths, 7717. The capital is Georgetown, with a population of 58,822. The chief pursuit is agriculture and the principal products are sugar, rice, and coconuts. Stock raising is of some importance. The number of cattle in 1924 was 113,315; horses, 1800; sheep, 16,000; and goats, 9800. The mineral resources are considerable, gold, rough diamonds, and bauxite being found in large quantities. The principal exports are sugar, rough diamonds, rice, timber, and rum; and the chief imports are flour, fertilizers, machinery and hardware, and textiles. Statistics on revenue, expenditure, and trade for 1923 and 1924 are:

	1923	1924
	£	£
Revenue .....	1,114,704	1,056,288
Expenditures .....	1,081,549	1,065,457
Imports .....	2,668,961	2,744,145
Exports .....	3,757,647	3,393,529

In 1924, 3110 vessels with a total tonnage of 1,183,562 entered and cleared from the ports of British Guiana. Practically all the vessels were British and Dutch. There are 97½ miles of railroads. The colony is administered by a gover-

nor, assisted by a court of policy, consisting of seven official members and eight elected members, and a combined court, containing, in addition to the above, six financial members elected by the registered voters. Governor in 1926, Sir Cecil Hunter Rodwell.

**BRITISH HONDURAS,** hūn-dō'rās. A British crown colony on the Caribbean coast of Central America, east of Guatemala, and 700 miles west of Jamaica. Area, 8598 square miles; population, according to the census of 1921, 45,317; estimated, Dec. 31, 1924, 47,132. The movement of population in 1924 was: Birth rate, 38.38 per thousand; death rate, 25.54 per thousand; marriages, 391. In 1924 there were 66 primary schools with an enrollment of 6827. The chief pursuits are agriculture and forestry although only a small part of the land is cultivated. In the higher lands good pasturage is to be found. The following table supplied by the United States Bureau of Foreign and Domestic Commerce gives the available data on the import and export trade of British Honduras, 1918 to 1924:

VALUE OF BRITISH HONDURAS TRADE  
[In thousands of dollars United States currency]

Year	Value of imports	Value of exports	Total trade
1918 .....	\$3,565	\$3,669	\$7,234
1919 .....	4,695	4,449	9,144
1920 .....	5,876	5,046	10,922
1921 .....	3,344	3,045	6,389
1922 .....	3,290	2,818	6,108
1923 .....	4,037	3,197	7,234
1924 .....	3,894	3,338	7,232

The chief exports in 1925 were bananas, mahogany, cedar, and other forest products, plantains, coconuts, and chicle. The chief imports were clothing, cotton and silk goods, milk, flour, machinery and hardware. In that year as in previous years the United States led all other countries in respect both to imports and exports. The revenue in 1924-25 was £193,204 and the expenditures, £185,391. The public debt in the same year was £153,443. The tonnage entered in 1924 was 305,350 tons. The administration is under a governor assisted by an executive council of six members and a legislative council of five official and seven unofficial members. Governor and Commander-in-Chief in 1926, Maj. J. A. Burdon.

**BRITISH INDIA.** See INDIA, BRITISH.

**BRITISH NEW GUINEA.** See PAPUA.

**BRITISH NORTH BORNEO.** A British colony, comprising the northern part of the island of Borneo. Area, about 31,106 square miles; population, at the census of 1921, 257,804, most of whom were Mohammedan settlers in the coast regions and aborigines in the interior, the Europeans numbering only 533. The most numerous tribes were the Dusuns (112,287), Muruts (37,447), and the Bajaus (33,070). The chief towns are Sandakan, with a population of 11,936 on the east coast and Jesselton, on the west coast.

Only a small part of the soil is arable. The principal products are: Timber, coconuts, rye, sago, gum, coffee, fruits, spices, gutta-percha, camphor, rattans and other forest products, and tobacco. Coal, iron, gold, and mineral oils are also to be found to some extent. The trade is chiefly carried on with Great Britain almost entirely through the ports of Hong Kong and

Singapore. There is a railway 127 miles long running from Jesselton to Melalap, with a branch to Brunei Bay. Statistics of finance and trade for 1923 and 1924 were:

	1923	1924
	£	£
Revenue .....	357,404	371,007
Expenditure .....	344,779	275,601
Imports .....	770,987	827,862
Exports .....	1,213,485	1,301,715

The shipping entering in 1924 was 347,960 tons. The territory is under the jurisdiction of the British North Borneo Company, and the administrative functions are exercised by a governor in Borneo and a board of directors in London. Mr. Aylmer C. Pearson, who was the governor of North Borneo at the beginning of 1926, died on March 15 of that year.

**BRITISH SOMALILAND.** See SOMALILAND, BRITISH.

**BRITISH SOUTH AFRICA.** See SOUTH AFRICA, BRITISH.

**BRITISH WEST AFRICA.** The general name given to the following British colonies in West Africa; Nigeria (colony and protectorate); Gold Coast (comprising the Gold Coast colony, Ashanti, and the Northern Territories); Sierra Leone (colony and protectorate). See separate articles.

**BROADWAY, NEW YORK CITY, CELEBRATION.** See CELEBRATIONS.

**BROMINE.** See CHEMISTRY, INDUSTRIAL.

**BROOKE, JOHN RUTTER.** American soldier, died at Philadelphia, Pa., September 5. He was born in Pottsville, Pa. in 1838, and in 1861, entered the Union Army as a captain of Pennsylvania volunteers, rising through successive grades until he reached the rank of colonel, and at the close of the war was commissioned brigadier general of volunteers. He was breveted major general of volunteers for service during the Battles of the Wilderness. Resigning from the volunteer service in 1866 he became lieutenant colonel in the regular army and, in 1879 was commissioned colonel, being appointed brigadier general in 1888, when he commanded the Department of Dakota with headquarters at St. Paul, Minn. In 1897 he was made major general and in the following year, during the Spanish-American War he was sent to Porto Rico where he served on the commission to arrange for its evacuation by the Spanish troops. In October he was appointed military governor and commanding general of the department, and from December, 1898 to December, 1899 he was military governor of Cuba, and commanding general of the Division of Cuba. From 1900-02, when he retired, he commanded the Department of the East.

**BROOKLYN INSTITUTE OF ARTS AND SCIENCES.** An institution at Brooklyn, N. Y. founded in 1824, composed of three divisions, Education, Museums, and a Botanic Garden. It was incorporated in its present form in 1890. Membership is open to all who are interested in any branch of science or art. The Institute is divided into several departments, each of which is composed of members interested in its particular field. These departments conduct educational courses and give addresses, lectures, and concerts. Among the various departments are: agriculture, fine arts and architecture, astronomy, botany, dramatic art, electricity,

engineering, home economics, music, pedagogy, philology, photography, physics, psychology, French language and literature. The School of Pedagogy had an enrollment of 1500 students in 1926. A forum conducted by the departments of Political Science and Sociology, provides for the discussion of current problems. The Museum contains collections in the fields of art, ethnology, and natural science. Its library contains over 26,000 volumes. Fifty acres are devoted to the Botanic Garden. In 1926 the Institute's permanent funds totaled \$2,033,237, and those to meet current expenses, \$624,782.20. Attendance at lectures and concerts was 283,028; that at all activities of the institute 970,041. The president of the Board of Trustees was Frank L. Babbott. Charles D. Atkins was director of the Department of Education, William Henry Fox of the Museum of Arts and Sciences, and C. Stuart Gager of the Botanic Garden. Headquarters are at the Brooklyn Academy of Music, 30 Lafayette Avenue, Brooklyn, N. Y.

**BROWN, SIR JOHN MACLEAVY.** Former oriental administrator and scholar, died in London April 6. He was born at Magheragall, County Antrim, Ireland, November 27, 1842, and was educated at the Belfast Academy, and Trinity College, Dublin. On July 18, 1861, after a competitive examination, he was appointed a student interpreter in China and in 1864 became assistant Chinese secretary to the British Legation at Peking to which he had been attached. He was in charge of the Legation in 1867 and, in 1868 became secretary of the mission headed by Anson Burlingame, an American, appointed by Prince Kung of the Chinese Government to represent China abroad. After the death of Mr. Burlingame in 1870 at St. Petersburg the mission was broken up, and Brown returned as acting Chinese secretary in Peking. He resigned in May, 1872 to enter the Chinese Customs service, where he made for himself a notable record, soon being promoted to be Commissioner of Customs. In 1898 he was appointed head of the Customs and soon afterwards Controller of Finance in Korea at the time when China, Japan and Russia were engaged in a bitter struggle for predominance. Brown was able to organize the finances, and attracted foreign trade by building lighthouses, making surveys, and suppressing smuggling, as well as improving sanitary conditions. His work here secured the support of the British and Japanese Governments. In 1903 Russia, through the agency of Admiral Alexieff, its representative, procured Brown's dismissal from the Korean Emperor. However, with the support of the other two nations it was ignored and later withdrawn. Brown was a great influence in holding Korea together at this time of struggle and, after the Korean Emperor, Yi Hyeung placed the foreign relations of his country in the hands of Japan, Brown resigned in 1906. He was later made counselor of the Chinese Legation in London, having been called to the English bar by the Inner Temple in June, 1882. He was made a Companion of St. Michael and St. George in 1898, and knighted in June, 1906. He received high Chinese, Japanese, and Korean decorations including that of the first-class Sacred Treasure of Japan and first-class Order of Tai-Kuk, Korea. He was said to be the last survivor of the Burlingame Mission of 1868-70, an important movement in Chinese diplomacy.

**BROWNING, JOHN M.** American inventor of automatic firearms, died at Herstals, near Liège, Belgium, November 26. He was born at Ogden, Utah, Jan. 21, 1855, the son of a gunsmith, and at the age of 13 made his first gun of scrap iron in his father's gunshop. In 1879 he patented a breechloading rifle, and in 1884 a repeating rifle, following it in 1895 with a box magazine. His automatic pistol was adopted by the United States Government in 1908, and his machine gun and machine rifle in 1918, being used extensively in the World War. In particular two of his weapons, the automatic rifle and the automatic machine gun, water cooled and mounted on a tripod, were extensively used, the latter also as an aircraft gun. It is interesting to note that no design of Browning's ever proved a failure, nor was any model produced by him discontinued. He was constantly endeavoring to solve problems for the United States Army Ordnance Department and many types of weapons adopted by that body were due to his genius. The manufacturing rights for many of his weapons were secured by the leading arms companies in the United States. At the time of his death Mr. Browning was in Belgium perfecting a double barrelled shotgun where one barrel was placed above the other. He had received the decoration of the Order of Leopold of Belgium and after his death his body lay in state in the grand hall of Belgium's National Arms Works. His remains were brought to the United States where they were received with military honors and forwarded to his home at Ogden, Utah.

**BROWN-TAIL MOTH.** See ENTOMOLOGY, ECONOMIC.

**BROWN UNIVERSITY.** An institution of higher education at Providence, R. I.; founded in 1764. In the autumn of 1926 the enrollment was 2094, of whom 242 were graduate students; 1301 undergraduate men; 452 in the Women's College; 99 in the School of Education. The faculty numbered 132, 51 new appointments having been made in 1926. The permanent productive funds of the University amounted to \$3,570,380.26, and the temporary funds to \$813,904.72. The University's receipts for the year from all sources were \$2,034,974.70. The library contained 350,000 volumes. During the year the University charter was amended, removing the Baptist denominational requirement for President and adding six undenominational trustees, the charter having originally called for 22 Baptist trustees and 14 of other denominations. Entrance requirements were changed to require more algebra. New offices created were: student counselor and director of religious activities, to which O. T. Gilmore was appointed; athletic coach as a member of the faculty, such appointment having been made for the first time for the entire year; athletic council, to have full control of all athletic sports. The endowment and building funds were increased by \$1,000,000, one-half being given by two brothers contingent upon an additional \$500,000 from graduates and friends. A bequest of \$5000, as well as several smaller bequests, was received for the founding of scholarships. A U. S. Government Post Office was established on the campus and housed in a small building previously erected. New buildings were: Littlefield Hall and Hegeman Hall, dormitories; Marston Hall of Modern Languages; and Alumnae Hall, for social purposes,

at the Women's College. President, William Herbert Perry Faunce, D.D., LL.D.

**BRUNEI, brōo-nī'.** A British region on the northwestern coast of the island of Borneo. Area, about 2500 square miles; population, according to the census of 1921, 25,444, of whom the Europeans numbered only 35, the bulk of the population being made up of Malays and native Borneans. Brunei is the chief town with a population of about 10,000. Among the principal products may be mentioned mangrove extract, rubber, coal, sago, and jelutong. Cloth-weaving, silverware, brass-founding, and boat building are found among the native industries. In 1924 the chief exports were cutch, coal, rubber, jelutong, and forest products; the chief imports, rice, tobacco, kerosene oil, piece goods and sugar. The revenue in 1924 was £32,372; expenditure, £28,885; public debt, Dec. 31, 1924, £50,808. The administration is in the hands of a British Resident, the sultan retaining the name only and with his two principal ministers receiving a subsidy from the British government. Sultan at the beginning of 1926, Ahmed Tajudin Akhazul Khairi Wad-din, a minor, who succeeded his father in September, 1924. British Resident, E. E. F. Pretty.

**BRUSILOFF, brōo'sloff, ALEXEI ALEXEIVITCH.** Russian general, died in Moscow, March 17. He was born at Kutais in the Russian Caucasus in 1853, coming from a family distinguished in Russian military and political life. Educated for the Russian army he served in the Caucasus and distinguished himself in the Russo-Turkish War of 1877-78. In 1910 he had risen to the rank of corps commander and in 1911 had the command of the army corps stationed at Vinnitsa (Russian Podolia) and its military district, which bordered on East Galicia and hence was considered the most important military area within the Kieff command.

With the outbreak of the World War Brusiloff was chosen to lead the army invading Galicia, and in command of the eighth army he fought the battles of the Carpathians and made raids into Hungary. He retired as a result of the disaster overtaking the adjoining third army on the Dunajetz, but, while retreating, he captured a large number of prisoners, and in September, 1915 made a brilliant counter-attack in Volhynia which gave the Russians for a time command of Lutsk and permanently secured for them Rovno. In April, 1916, General Brusiloff succeeded General Ivanoff in command of the Russian armies south of the Pripet marshes with a total strength estimated by the Germans of 41 infantry divisions and 14 cavalry divisions. The offensive Brusiloff was able to undertake was remarkably successful, and in November he even believed the war to be won. In the following year Brusiloff was appointed to the supreme command after the Coalition Cabinet had been formed by Prince Lvoff with Kerensky as Minister of War and Marine. After a few successes the Russian army failed in the movement attempted against the Germans and the Austro-Hungarians, marking the end of Russia's participation with the Allies. It was stated that Brusiloff accepted the Bolshevik régime, and the statement often was made, though in error, that he commanded the Red armies during the wars of 1919-20. He was reported to have worked in establishing a military system for Russia, but from 1924 on he lived in seclusion.

**BRYN MAWR COLLEGE.** An institution for the higher education of women at Bryn Mawr, Pa.; founded in 1880. The enrollment for the autumn of 1926 totaled 482, of whom 384 were undergraduates, distributed as follows: 81 seniors, 86 juniors, 85 sophomores, and 129 freshmen, 3 hearers, 18 resident fellows, and 80 graduate students. The teaching staff numbered 67. The productive funds of the college amounted to \$6,400,000, and the income for the year to \$963,459. The number of volumes in the library was 112,136. President, Marion Edwards Park, Ph.D., LL.D.

**BUBONIC PLAGUE.** The Health Organization of the League of Nations at Geneva has recently issued a large quarto volume which gives a summary of the statistics of notifiable diseases during 1925 in 33 European, 34 African, 24 American and 23 Asiatic countries with Australia. The data are naturally of varying merit and accuracy. The report deals at some length with the prevalence, rise and decline of plague all over the world. An agreement has been in operation for many years by which any plague-infected port is notified to everybody, so that ships coming from there may be treated with due respect. Every continent except Australia is more or less infected, from California to Celebes and from the Black Sea to the Cape and Brazil. However, serious epidemics in 1925 were limited to Nigeria, Kenya, Uganda, Madagascar, India and Java, and the whole consideration will make the reader wonder what is to be the progress and termination of the pandemic which started out of southern China 32 years ago. The volume is illustrated with instructive maps. It is discussed in the *Lancet* (London), September 18, 1926, page 612.

**BUCKNELL UNIVERSITY.** A coeducational Baptist institution of liberal arts; founded in 1846 under the name of the University of Lewisburg, but renamed in 1886 in honor of its benefactor, William Bucknell. In the autumn of 1926 the enrollment was 1046, of whom 651 were men and 395 were women, and for the summer school of 1926 the total registration was 310, 167 men and 143 women. The faculty had 68 members. The productive funds amounted to \$1,150,000, and the income for the year to \$509,250. A campaign for increased endowment was completed during the year. The library contained 50,000 volumes. President, Emory W. Hunt, D.D., LL.D.

**BUCKWHEAT.** The United States, as estimated by the department of Agriculture, produced 12,922,000 bushels of buckwheat on 707,000 acres or at the rate of 18.3 bushels per acre. In 1925 the production was 13,994,000 bushels on 747,000 acres or at the rate of 18.7 bushels per acre. The average farm price on December 1, 1926, was 88.3 cents and on December 1, 1925, 88.8 cents per bushel. Among the twenty-three States reporting buckwheat production the leading States and their yields were as follows: New York 3,837,000 bushels, Pennsylvania 3,610,000 bushels, Minnesota 1,122,000 bushels, Michigan 765,000 bushels and West Virginia 684,000 bushels. The average farm price per bushel on December 1, 1926, ranged from 75 cents in Minnesota to \$1.10 in Tennessee. The exports of buckwheat from the United States for the year ended June 30, 1926, as provisionally reported, amounted to 66,000 bushels valued at \$70,000 while for the preceding fiscal year the

quantity exported was 180,000 bushels valued at \$208,000. Similarly, the imports amounted to 84,000 bushels valued at \$69,000 and 542,300 bushels valued at \$503,000 for the two years respectively.

**BUILDING.** In 1926, building in the United States, as indicated by the total amount of contracts, reached the record total of about \$7,800,000,000, according to the estimates of the *Engineering News-Record*, as compared with \$7,500,000,000 in 1925 and \$6,000,000,000 in 1924. This, of course, included residential buildings and the smaller construction jobs as well as the industrial buildings and more important engineering work, for which the authority mentioned assembles figures in considerable detail. For industrial buildings of \$40,000 and more, other buildings of \$150,000 and more, and construction other than buildings of \$25,000 and more, the 1926 total was \$2,851,786,000 as compared with \$2,559,443,000 in 1925, or a gain of 11 per cent. During the year 1926 the Construction Cost Index Number rose about two per cent.

The statistical division of the F. W. Dodge Company gave its estimate for 1926 of building construction as \$6,800,000, or a gain of 3 per cent over 1925, and stated that this was practically all made in the first two months of the year, from which time there was a decline in the award of contracts for projects. A spirit of caution was manifested during the year, as it was generally felt that there was a danger of over-building, and that speculative tendencies should be held in check. Some of the warning signs which were observed were falling rents, the collapse of the Florida boom, the break in the stock market in March, and similar instances, which were taken as indicating the necessity of a period of caution. Nevertheless it was believed that the normal amount of construction in the United States under existing conditions reached between six and seven billion dollars worth of work annually.

The chief causes of the increase in 1926 were the large amount of industrial power plant and civil engineering developments which were put under way, and under the financial conditions at the end of the year it was anticipated that this class of construction would continue for some time. There was also considerable residential work, including high-class apartments and hotels, together with commercial buildings, which helped to swell the grand total, and it was not anticipated that the rate in this field would continue.

Looked at from another angle the year 1926 showed a decrease of \$230,542,857, or 5.9 per cent, from the total of building permits for the preceding year. This, according to returns made to Bradstreet's, broke the record that was made for the seven years stretching from 1919 to 1925.

The following table gives the totals of expenditure permitted for in the various groupings in the years 1926 and 1925:

	Twelve months	
	1926	1925
New England .....	\$172,060,638	\$225,757,885
Middle Atlantic .....	1,554,248,275	1,566,745,778
Central Western .....	876,408,832	897,028,778
Northwestern .....	129,281,412	146,292,922
Southwestern .....	184,959,021	220,582,514

	Twelve months	
	1926	1925
Southern .....	357,393,930	378,278,514
Far Western .....	378,277,260	448,489,489
Total United States	\$3,652,629,368	\$3,883,172,225
New York City .....	1,046,332,904	1,026,980,817
Outside N. Y. ....	2,606,296,454	2,856,191,408
Canada .....	109,076,771	84,865,124

According to statistics compiled by the Associated General Contractors, construction costs declined slightly during 1926, reaching the lowest average occupied in any year since 1922. The tendency toward lower cost levels, in force since midsummer of 1923, continued.

The lowest mark reached during 1926 was noted in October, and the highest level was assumed in May, the respective index figures being 195 and 199. The December figure was 196.

The decline in the average cost of operations in 1926 was largely the result of decreases, in the prices paid by general contractors for basic materials entering into their operations, of five points from the index figure of 183 established in 1925. The average of wages paid by contractors in the principal construction centres of the United States during 1926 was slightly more than the corresponding average registered for 1925.

**NOISELESS STEEL BUILDING.** On December 15, a notable demonstration of noiselessly welding a five-story steel building was made at Sharon, Penna., by the Westinghouse Electric and Manufacturing Company. This building, at the Sharon works of the Company, was the first multi-story skeleton structure designed specially for arc welding in place of the noisy riveting, and was thought by many to mark a new era in steel fabrication and erection. In this type of construction the riveters previously employed were converted into welders in three weeks of training, and it was found that the work not only could proceed noiselessly, but was more economical in the amount of steel required. The new building came as an outgrowth of many years' experiments by welding engineers, and according to their data, greater strength at joints and less steel in welding could be secured than in riveted construction. The Sharon building, for example, required 700 tons of steel, while for a similar building of riveted construction 800 tons would have been necessary. In the arc welding process cleaner looking columns and joints were obtained and the welded joints were found stronger than riveted joints, while an additional saving was the elimination of plates and angles and the possibility of using lighter beams. In riveted construction the size of the beam was determined not so much by the weight to be carried as by the strength of the riveted joint.

**WRECK OF STEEL BUILDING.** In connection with the great hurricane of September 18, at Miami, Fla., there occurred the first wrecking of a steel frame office building ever recorded. This was due to lack of strength to withstand the extraordinary wind pressure and inasmuch as other structures of similar nature resisted the wind the failure was assigned to poor design.

**BUKOWINA**, bōō'kō-vē'na. A former crownland in the Austro-Hungarian Empire, which was annexed to Rumania after the fall of the Central Powers in 1918-1919. Area, 4030 square miles; population, 800,098. It is represented, in the

Rumanian legislature by 19 senators and 16 deputies.

**BULGARIA.** A constitutional monarchy in the Balkans lying to the south of Rumania and the east of Jugo-Slavia. Capital, Sofia.

**AREA AND POPULATION.** As a result of the World War, the area of Bulgaria was reduced from 53,305 to 39,814 square miles. The estimated population on Jan. 1, 1925, was 5,033,900 as compared with the actual population, according to the census of 1920, of 4,846,971. The chief cities with their populations, according to the same census are: Sofia, 154,025; Philippopolis, 63,418; Varna, 50,819; Ruschuk, 41,574; Slivno, 28,590; Plevna, 27,440; Stara Zagora, 25,491; Choumen, 23,975; Burgas, 21,170.

**EDUCATION.** Elementary education is free and compulsory for children between the ages of seven and 14, and is supported by the state authorities. In 1923-24 there were 4052 national elementary schools, with 13,312 teachers and 458,330 pupils. There were also 1695 elementary private schools with 2525 teachers and 82,799 pupils. Secondary and higher schools are gymnasiums and progymnasiums, and various institutions for special instruction and training of teachers. The state university at Sofia in 1924 had 237 professors and 2373 teachers. There is also a free university with 45 teachers and 1865 students.

**PRODUCTION, ETC.** The principal occupation of the people is agriculture. The land is held in absolute freehold, the greater part of the holdings being under small proprietors (one to six acres). The methods of cultivation are primitive, although in recent years some farm machinery has made its appearance. About two-thirds of the people are engaged in cultivating the 9,182,409 acres of land under crops. The accompanying table from the *Statesman's Year Book* for 1926 shows the acreage and yield of the cereal crops in 1925:

Cereals	1925 "	
	Area Acres	Yield Tons
Wheat .....	2,586,139	1,351,075
Rye .....	452,603	225,792
Mealin .....	234,611	118,715
Barley .....	543,961	319,007
Oats .....	353,578	148,456
Spelt .....	22,104	12,026
Millet .....	19,397	9,117
Maize .....	1,530,612	.....
Rice .....	12,568	.....
Total .....	5,705,582	2,184,190

\* Excluding maize and rice.

Fruit is raised in large quantities especially around Kustendil; the wine production in 1924 was 16,720,000 gallons. Cotton was grown on 5650 acres in 1925 and the yield was 560,000 kilos. Honey, sugar, and tobacco are also raised to some extent. The minerals are rich, but considerably undeveloped. They include coal, iron, copper, and manganese. The total coal production in 1924 was 1,214,840 metric tons. Manufacturing is also rather backward although the government encourages industrial enterprises.

**COMMERCE.** According to the United States Bureau of Foreign and Domestic Commerce, both imports and exports increased during 1925, imports amounting to 7,291,341,000 leva and exports to 5,642,466,000 leva, as compared with 5,357,311,000 and 4,902,226,000 leva, respectively, for 1924. The unfavorable balance of 1,648,875,

000 leva for 1925 is the largest since the war, exceeding the 1923 adverse record of 1,583,525,000 leva. The swelling of imports, to which this result is attributable, was caused largely by cereal purchases to the extent of 300,000,000 leva, made necessary through the lateness of the 1924 harvest, though there were increases also in imports of textile goods, machinery and implements, and colonial products. In spite of the best crop in years, exports in 1925 were affected by the reduced shipment of grain and beans. The low prices prevailing on the world markets offered little inducement to the peasants to dispose of their product, and when prices stiffened later in the year the grain shipments were retarded by bad weather.

Tobacco showed the largest increase in the export list, exceeding the value of the previous year by more than 400,000,000 leva and incidentally establishing a new export record for this commodity. Increases also occurred in shipments of eggs, livestock, rawhides and silk cocoons. Germany, Italy, England, and Czechoslovakia, in the order named were the principal sources for Bulgarian imports. Exports went chiefly to Germany, Italy, Greece, Austria, and Switzerland. The value of exports declared to the United States through the American consulate at Sofia during 1925 amounted to \$1,164,128 as compared with \$1,427,055 in 1924. The leading items in 1925 were dry sheep and lamb skins, dry goat and kid skins, tobacco, attar of roses, copper matte, carpets and mugs.

**FINANCE.** The chaotic methods of financing which characterized the war period in Bulgaria lost their prominence for the first time in the budget of 1922-23. At the instance of the Interallied Commission the charges on the peace treaty obligations were transferred from the extraordinary to the ordinary budget, which is covered by the actual receipts of the government. The extraordinary budget now comprises only those expenses which are made for actual increase in the country's industrial equipment and its productive capacity. Moreover, funds are not authorized until the funds are actually available. The budget for 1925-26 balanced at 6,875,000,000 leva. The estimated receipts under this budget were increased over those of 1924-25 by 271,000,000 leva, of which the greater part was contributed by indirect taxes. The ordinary budget for 1926-27 as voted by the Sobranje, provided for a balance of revenue and expenditures at 6,924,000,000 leva.

**COMMUNICATIONS.** The number of vessels entered at the Black Sea ports in 1924 was 3841 of 1,489,389 tons; the number cleared, 4000 of 1,493,662 tons. At the Danube ports there entered 10,581 vessels of 2,331,572 tons and cleared 10,570 vessels of 2,303,999 tons. In 1923 Bulgaria had a railway mileage of 1613, all belonging to and operated by the state. Receipts of the Bulgarian National Railways diminished during the fiscal year 1925-26, ended March 31, as compared with the amount obtained during the preceding year. The 1925-26 total was 889,800,000 leva as against 923,500,000 leva for 1924-25. Freight transported decreased but the number of passengers increased.

**GOVERNMENT.** The king is at the head of the government, assisted by a council of ministers nominated by him, and a single legislative chamber known as the Sobranje composed of 227 members. In 1926 the king was Boris III, who suc-

ceeded to the throne upon the abdication of his father, Oct. 3, 1918. The parties in the Sobranje, elected in 1923, were distributed as follows: Government coalition, 172; radicals, 14; socialists, 30; national liberals, 8; agrarians, 39; communists, 99. The ministry as organized at the beginning of 1926 was: Premier and Minister of Interior, A. Liaptcheff; Education, N. Naidenoff; Justice, Dr. Kuleff; Commerce, M. Bobotchevsky; Finance, V. Molloff; Public Works, S. Vassileff; Posts and Railways, K. Georghieff; Foreign Affairs, A. Buroff; Agriculture, D. Cristoff; War, General Ivan Volkoff.

**HISTORY.** The year was a comparatively quiet one for Bulgaria, its peace only being marred from time to time by depredations along its borders by groups of bandits. At the very beginning of the year (January 3), the Tsankov government tendered its resignation to King Boris who accepted it and charged André Liaptcheff with the formation of a new government. He did so and presented the results to the King on January 4. The members of his cabinet are mentioned above in the paragraph on *Government*. In some quarters it was felt that the King had prepared the way for trouble with Jugo-Slavia by the appointment of Liaptcheff who was essentially a politician with views known to be unfriendly toward Belgrade. On the other hand, the King was glad to get rid of Premier Tsankov because of his propensity for stirring up internal troubles with his so-called terrorist rule. He was elected to the presidency of the Sobranje. At the very beginning of the year, the Interallied Military Control was withdrawn from Bulgaria because she had complied with all the treaty obligations set down for her. A general amnesty bill was passed in February which freed 7000 political prisoners and permitted the return of all exiles excepting the Communist Agrarian leaders who fled from Bulgaria and were still working for the overthrow of the existing régime.

During May there was considerable discussion in the legislature concerning the ratification of the treaty of friendship between Bulgaria and Turkey, which had been signed at Angora Oct. 28, 1925. The treaty was at first bitterly opposed because of the provisions concerning the liquidation of property of Bulgarian refugees. Needless to say, this group memorialized the legislature to reject the treaty. The premier urged ratification in order to establish good feeling between the two countries, and to provide an outlet for Bulgarian goods in the Turkish market. The Turkish press was severe in its denunciation of the delay on the part of Bulgaria in ratifying the treaty. At the end of May the Sobranje finally ratified it.

During the summer the press reported the oft-told story of the activity of Bulgarian bandits on the Rumanian and Jugo-Slavian borders. Considerable loss of life and property was reported in the Dobrudja area of Rumania. The League of Nations Secretariat was kept informed of the situation but did not feel called upon to interfere, and the countries involved were loath to complain to the League because Bulgaria was anxious to get a war refugee loan and Rumania was attempting to settle the Transylvanian minority question. The Bulgarian government was granted an advance of £400,000 by the Financial Committee of the League on July 23 for early crop sowing, etc., as a part of a loan

of £2,250,000 to be made later to help Bulgaria solve her refugee problem.

The question of the bandit raids took a more serious turn in August when the diplomatic representatives of Greece, Jugo-Slavia, and Rumania sent a joint note to Bulgaria demanding that the Bulgarian government take more stringent methods in dealing with the brigands on her borders and that the government "put an end to the activities of revolutionary elements which are well known to it, and prevent any recurrence of comitadji raids." Bulgaria replied to this note that she was just as much concerned in keeping the peace on her borders as her neighbors were, but that the provisions of the Treaty of Neuilly did not permit her an armed force large enough to cope with the situation, and furthermore, she was perfectly willing to let the League of Nations inquire into the entire Balkan situation. In the meantime she sent a petition to the League asking that such an investigation take place. The senders of the joint note were dissatisfied with Bulgaria's reply because there were no guarantees that the depredations would stop.

**BULLOCK**, LIEUTENANT-GENERAL SIR GEORGE, K.C.B. British soldier, died January 28. He was born at Warangol, India, Aug. 15, 1851, and was educated at Cheltenham and University College, Oxford, before going to Sandhurst for his military training. His first commission was in the First Battalion of the Eleventh Foot (Devon Regiment) in 1872, and after studying at the Staff College in 1880, he became brigade major at Shorncliffe, serving from 1882-87, and as Deputy Assistant Adjutant General in India from 1889-94. He was in command of the Second Devon Regiment in South Africa in 1899 and was captured by the Boers after a severe struggle at Colenso. Released from captivity he and his command were attacked at Honing Spruit by greatly superior numbers and conducted a spirited defense. In this campaign he was made brigadier general commanding a column, and was mentioned in dispatches, and in 1900 was made brevet colonel, C. B. He served as chief staff officer in Egypt from 1902-04, and in the latter year was made brigadier general commanding Alexandria until 1905, when he was chosen major general commanding in Egypt in which capacity he served until 1908. In 1910-11 he commanded the West Riding Territorial Division, and in 1912 was made governor and commander-in-chief of Bermuda. While General Bullock was instinctively a soldier and vigorous fighter, yet the Boer War was the only occasion when he saw active service, as he was retired at the time of the World War. He was created Knight Commander of the Bath in 1911.

**BURBANK**, LUTHER. American plant breeder and horticulturist, died at Santa Rosa, Cal., April 11. He was born near Lancaster, Mass., Mar. 7, 1849, and spent his boyhood on a farm, receiving his early education at the Lancaster Academy. At a very early age he was interested in horticulture and experiments; he finally became a nurseryman in his native town where he continued his experiments and studies. After a visit to California in 1875 he moved to Santa Rosa, where he established his farms and experimental gardens. Previously at the age of 22 he had produced the Burbank potato, an improved variety, which soon was recognized by the agricultural world; he worked earnestly and

with success, hoping to be able to abandon the commercial side for extensive experiments in plant breeding and evolution.

In 1890 the success of his farms was such as to enable him to devote himself entirely to producing better forms of fruits and vegetables, and soon his work was widely recognized. In addition to the Burbank potato he originated the rapid-growing edible thornless opuntias (cactus), Gold, Wickson, Apple, October, Chalco, America, Santa Rosa, Formosa, Beauty, Eldorado, and Climax plums; the Giant Splendor, Sugar, Standard and Stoneless prunes; a new fruit, the Plumcot which was a combination of the plum and apricot; the Burbank and Abundance cherries; the Peachblow, Burbank and Santa Rosa roses; gigantic forms of amaryllis, tigridias, the Shasta Daisy, Giant and Fragrance callas; and various new apples, peaches, nuts, berries, and other valuable trees, fruits, flowers, grasses, grains and vegetables. At the time of his death Mr. Burbank had over 3000 extensive experiments under way and was growing over 5000 distinct botanical specimens from all parts of the world. Every year more than a million plants were raised at the Santa Rosa farms for testing. Some of his plants were under observation for 25 years, and a careful record was maintained of the various observations and changes.

Burbank had been a special lecturer on evolution at the Leland Stanford Jr. University, and was a member of many scientific and horticultural societies in Europe and the United States, as well as being interested in numerous local activities. He was the author of: *Training of the Human Plant; Methods and Discoveries* (12 volumes); *How Plants are Trained to Work for Man* (8 volumes), (1921); and numerous magazine articles. In addition to his practical work in horticulture Burbank aroused a universal interest in plant breeding, and he was looked upon as one who had enriched horticulture and its votaries through his improved fruits, and had developed many wonders for the flower garden. He was one of the foremost exponents of evolution, and shortly before his death became involved in a controversy in which he expressed himself as opposed to the traditional fundamentalist view of religion.

**BURGOYNE**, SURRENDER OF. See CELEBRATIONS.

**BURMA**. The largest and most easterly province of British India; since 1923, a governor's province under the Government of India Act of 1919. Area, 262,732 square miles; population (1921), 13,212,192. Kangoon, with a population of 341,962, is the capital of Lower Burma; and Mandalay, with a population of 148,917, is the capital of upper Burma. Politically Burma is a province of British India, but geographically and socially it may be regarded as a separate unit having little in common with India proper. Being almost entirely agricultural, it does not share the rest of the country's industrial ideas. Such industries as Burma has are those essential for the preparation of its products for the market—rice mills for husking rice, sawmills for squaring its teak, refineries for oil, and cotton gins. Rice mills alone make up about three-fifths of its total industrial community. The principal crop is rice, two-thirds of Burma's agricultural area being given to its culture. In poor years most of the crop is consumed locally, leaving but little surplus for

export. The rice crop harvested at the beginning of 1925 yielded a total of 5,890,000 tons of husked rice. Although the 1926 crop was estimated as somewhat smaller, it was expected that almost 3,000,000 tons would be available for export. The cotton crop of 1925 was also large and yielded 67,200 bales of 400 pounds each as compared with 47,600 bales for 1924. The total value of exports in 1925 was \$269,731,000 and imports, \$130,569,500. Burmese railways, which run chiefly north and south, had an aggregate length in 1926 of 1859 miles. The capital invested amounted to \$91,129,270, of which the government owned \$67,690,950.

The government is administered by a governor and legislative council. Governor in 1926, Sir Spencer Harcourt Butler.

**BURRAGE, HENRY SWEETSER.** An American clergyman, editor, and historian, died at Kennebunkport, Me., March 9. He was born at Fitchburg, Mass., Jan. 7, 1837, and after graduating from Brown University with the degree of A. M. in 1861, served in the Civil War in the 36th Massachusetts Volunteers from 1862-65, being promoted through successive grades to captain and brevet major. He also acted as assistant adjutant-general on the staff of the First Brigade, Second Division, Ninth Army Corps. Ordained to the Baptist ministry in 1869 he became pastor at Waterville, Me., and then became editor of *Zion's Advocate*, a position he held until 1905. In 1905 he was chaplain of the National Home for Disabled Volunteer Soldiers, serving until 1912, and was state historian of Maine from 1907 to his death. He was active in the Baptist denomination of his state, being recording secretary of the Maine Baptist Missionary Convention from 1875-1905, a member of the American Baptist Missionary Union, 1876-1904, and president of the Maine Baptist Education Society, 1893-98.

He took a prominent part in various patriotic and hereditary organizations, being recorder of the Maine Commandery of the Loyal Legion from 1889-1912, secretary of the Maine Society of the Sons of the American Revolution, 1890-1905, secretary of the Maine Society of Colonial Wars, 1898-1905, and chaplain in chief of the Loyal Legion from 1899 until his death. He was a trustee of Colby College from 1881-1905, and of Newton Theological Institution from 1889-1906. He was a trustee of Brown University from 1889-1901 when he became a member of the board of fellows. He was a prolific writer dividing his interest between theological and colonial history. His works include: *Brown University in the Civil War* (1868); *The Act of Baptism in the History of the Christian Church* (1879); *History of the Anabaptists of Switzerland* (1882); *Baptist Hymn Writers and Their Hymns* (1888); *History of the Baptists in New England* (1894); *History of the Baptists in Maine* (1904); *Gettysburg and Lincoln* (1906); *Early English and French Voyages* (1906); *Maine at Louisburg in 1754* (1910); *Beginnings of Colonial Maine* (1914); *Maine in the Northeastern Boundary Controversy* (1919); *Maine Historical Memorials* (1922); *Gorges and the Grant of the Province of Maine, 1622* (1923); *Thomas Hamlin Hubbard, Brevet Brigadier General United States Volunteers* (1923); also papers in reviews and magazines. He was the editor of: *History of the Thirty-sixth Massachusetts Volunteers* (1864); *Rosier's*

*Relation of Waymouth's Voyage to the Coast of Maine, 1605* (1887); etc.

**BURRELL, DAVID JAMES.** American clergyman and author, died at Madison, N. J., December 5. He was born at Mt. Pleasant, Pa., Aug. 1, 1844, and after graduating at Yale in 1867, studied at the Union Theological Seminary in New York, being ordained to the Presbyterian ministry in 1872. After working for four years as a missionary in Chicago he became pastor of the Second Church at Dubuque, Iowa, in 1876, serving until 1877, when he was called to the Westminster Church at Minneapolis. In 1891 he went to the Marble Collegiate Church in New York City where he was pastor at the time of his death. In addition to his pastoral work he taught practical theology in Princeton Seminary for many years and he was also a summer preacher at Elberon, N. J. He was president of the Anti-Saloon League of New York City, and was vice-president of the Lord's Day Alliance of the United States. He was a member of the executive committee of the United Society of Christian Endeavor. He received the honorary degrees of D.D. from Parsons College in 1883 and from Rutgers College in 1910, and that of LL.D. from Hope College in 1900. At the time of his death he was senior minister of the Collegiate Reformed Protestant Dutch Church, New York City, the oldest church on the North American Continent, being founded in 1628. In theology he was extremely conservative and his sermons were printed and widely distributed. He wrote extensively and some of his more important works included: *The Religions of the World* (1891); *Hints and Helps* (1891-93); *The Gospel of Gladness* (1892); *The Early Church* (1897); *The Religion of the Future* (1894); *The Wonderful Teacher* (1902); *Teachings of Jesus Concerning the Scriptures* (1904); *The Lure of the City* (1908); *The Cloister Book* (1909); *In David's Town* (1910); *At the Gate Beautiful* (1911); *The Home Sanctuary* (1911); *The Gateway of Life* (1912); *The Old-Time Religion* (1913); *The Sermon* (1913); *We Would See Jesus* (1914); *The Apostles' Creed* (1915); *Why I Believe the Bible* (1917); *The Laughter of God* (1918); *Campaigns of Paul* (1919); *The Resurrection and the Life Beyond* (1920); *Paul's Companions* (1921); and *Paul's Letters* (1921).

**BUSSES, MOTOR.** See AUTOMOBILES.

**BUTTER.** See DAIRYING.

**BUTTRICK, WALLACE.** American clergyman and educator, died in Baltimore, Md. May 27, while a patient at the Johns Hopkins Hospital. He was born at Potsdam, N. Y., October 23, 1853, and after studying at Ogdensburg Academy, the Potsdam Normal School, and enjoying private tuition, graduated from the Rochester Theological Seminary in 1883. He was ordained a Baptist minister the same year, and became pastor of the First Church of New Haven, Conn., serving until 1889, when he became pastor of the First Church of St. Paul, Minn., serving there until 1892, when he was called to Emmanuel Church, Albany, N. Y., a charge he held until 1902, when he became secretary of the General Education Board. His success in this work led to his election as president of the Board in 1917, a position he held until 1923 when he became its chairman, which position he held at the time of his death.

He was also a member of the Rockefeller

Foundation, of the International Health Board, of the China Medical Board, and trustee of the Peking University Medical College. He received the degree of D.D. from the University of Rochester in 1898, that of L.H.D. from Union in 1914, and LL.D. from Bowdoin in 1925. Dr. Buttrick was also much interested in foreign mission work, serving as a member of various missionary boards in the Baptist denomination. He was a man of keen judgment regarding men and policies, which worked for success in the promotion of education and good citizenship, and his wise and sympathetic aid to the cause of education throughout the southern states was of great value in their educational development. His work for education in the United States was widely appreciated and his death which came suddenly from a stroke evoked many expressions of appreciative sympathy from individuals and educative bodies.

**CALIFORNIA. POPULATION.** According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 3,426,861. The estimated population on July 1, 1926, was 4,316,000. The capital is Sacramento.

**AGRICULTURE.** The following table gives the acreage, production and value of the principal crops in 1925 and 1926:

Crop	Year	Acreage	Prod. bu.	Value
Hay	1926	1,849,000	5,149,000 *	\$62,541,000
	1925	1,925,000	5,624,000 *	77,598,000
Barley	1926	1,080,000	32,400,000	18,792,000
	1925	1,050,000	32,550,000	24,412,000
Cotton	1926	169,000	128,000 <sup>b</sup>	8,960,000
	1925	160,000	122,000 <sup>b</sup>	13,397,000
Wheat	1926	653,000	12,015,000	15,620,000
	1925	608,000	11,457,000	16,956,000
Rice	1926	149,000	7,986,000	10,462,000
	1925	103,000	4,800,000	8,160,000
Potatoes	1926	43,000	6,923,000	9,138,000
	1925	43,000	6,837,000	13,674,000
Sweet potatoes	1926	12,000	1,164,000	1,280,000
	1925	9,000	1,008,000	1,714,000
Corn	1926	77,000	2,510,000	2,661,000
	1925	81,000	2,843,000	3,355,000
Sugar beets	1926	48,000	895,000 *	.....
	1925	76,000	486,000 *	4,005,000
Grapes	1926	.....	2,040,000 *	53,040,000
	1925	.....	1,912,000 *	53,536,000
Peaches	1926	.....	21,252,000	19,977,000
	1925	.....	16,418,000	14,119,000
Dry beans	1926	805,000	5,460,000	16,380,000
	1925	240,000	4,560,000	18,696,000

\* tons, <sup>b</sup> bales.

**MINERAL PRODUCTION.** The State ranked second only to Pennsylvania in respect to the value of its total mineral production of 1924, given by the U. S. Bureau of Mines as \$428,175,652, as against \$375,492,868, the total for 1923. More than half of the 1924 total was derived from the value of petroleum produced. Petroleum production attained the quantity of 230,148,000 barrels in 1925, as against 228,993,000 barrels in 1924 and 262,876,000 barrels in 1923; and a value in 1925 estimated at \$320,000,000, as against \$274,653,000 in 1924 and \$242,731,000 in 1923. The State retained first place in 1925 in quantity of petroleum produced. Cement was produced in 1925 to the quantity of 12,941,000 barrels, and in 1924, of 11,615,379 barrels. Shipments were valued in 1925, at \$25,853,000 and in 1924 at \$25,532,000. Natural gas production attained the quantity of 189,692,000 M cubic feet in 1924, and of 131,434,000 M cubic feet in 1923; and a value of \$35,949,000 in 1924 and \$22,787,000 in 1923. Gasoline from natural

gas was produced in the quantity of 303,200,000 gallons in 1925, and of 232,579,000 in 1924; and to a value of \$32,000,000 (estimated) in 1925 and \$22,690,000 in 1924. Clay products attained a value of \$20,994,732 for 1924, and of \$20,883,053 for 1923. The State's gold production was again the highest for any State, being in 1925, 641,849 troy ounces, valued at \$13,268,200, and in 1924, 633,021 troy ounces, valued at \$13,085,700. There were produced in 1925, 3,240,400 troy ounces of silver, valued at \$2,248,838; in 1924, 3,598,773 troy ounces, valued at \$2,411,153. Copper production was 46,943,604 pounds in 1925, and 49,433,716 pounds in 1924. The copper produced in 1924 was valued at \$6,826,039. Among other mineral productions of the State were asphalt, to the quantity in 1924 of 492,045 short tons, valued at \$5,689,315; salt, 268,112 short tons, valued at \$1,361,166; sand and gravel, 11,132,930 short tons, value \$6,653,536; and stone, 7,192,730 short tons, value \$8,635,602. Figures on 1925 production of minerals are in all cases taken from the U. S. Bureau of Mines Preliminary Summary covering that year.

The value of gold, silver, copper, lead, and zinc produced at mines in California in 1926, according to the estimate of the U. S. Bureau of Mines was \$19,078,000, a decrease of \$4,206,354 or 18 per cent as compared with the value of metals produced in 1925. There were decreased yields of 11 per cent in gold, 44 per cent in the value of silver, and 34 per cent in the value of copper, but increases of 13 per cent in the value of lead and 38 per cent in the value of zinc produced as compared with the previous year. The production of gold in 1926 was 565,000 ounces, valued at \$11,680,000, a decrease of \$1,385,330 as compared with 1925. The output of both placer and deep mines was less than in 1925, though the dredge output was nearly as large as that of the previous year. The dry year interfered with hydraulic work in all sections but did not materially restrict quartz milling. Serious forest fires destroyed several quartz mills in Tuolumne County. The silver produced in 1926 was 1,911,000 ounces, valued at \$1,192,000, as compared with 3,054,416 ounces valued at \$2,119,765 in 1925. The California Rand Silver was not productive after the first of October, which accounts for part of the decrease, but the large decrease in copper ore mined also affected the silver yield adversely and the lead ores shipped in 1926 were not so rich in silver as those produced in 1925.

The production of copper in 1926 was 31,500,000 pounds, valued at \$4,360,000, as compared with 46,864,913 pounds valued at \$6,654,818 in 1925. There was a much smaller yield of copper from Shasta County mines as compared with the previous year as a consequence of the withdrawal of the United States Smelting, Refining & Mining Company's operations in that field. The lead mines of southern California increased their output of lead by 1,183,800 pounds to a total of 7,750,000 pounds, valued at \$643,000, in 1926. Zinc produced by California mines in 1926 amounted to 16,370,000 pounds, valued at \$1,203,000, an increase of 4,880,763 pounds and \$329,818 in value as compared with the previous year.

**FINANCE.** As summarized by the United States Department of Commerce, payments for the maintenance and operation of the general

departments of the State for the fiscal year ending June 30, 1925, were \$58,947,702, and were at the rate of \$14.86 per capita. They included \$20,775,402 for education, apportioned to minor State divisions. The rate per capita for maintenance and operation of the general departments was in 1924, \$14.14; and in 1918, \$7.18. The expense of public service enterprises, \$1,754,155; interest on debt, \$4,408,123; and outlays for permanent improvements, \$10,158,806, added to payments for maintenance and operation of departments, made a total of \$75,088,786. For highways was expended the sum of \$15,003,956, of which \$8,492,099 was for maintenance and \$6,511,257 for construction.

Revenue receipts of the State totaled \$80,365,935, and were at the rate of \$20.26 per capita. They exceeded by \$15,435,955 the payments except for permanent improvements, and likewise exceeded by \$5,277,149 total payments, these included. The excess was reflected in the form of purchase of investments and of cash balances. Property and special taxes formed 19.6 per cent of the revenue in 1925, as against 22.4 per cent in 1924 and 23.7 per cent in 1918; their per capita rate was \$3.97 in 1925, \$3.88 in 1924 and \$2.20 in 1918. Earnings of the general departments and compensation for services rendered by State officials furnished 7.5 per cent of the 1925 revenue; business and non-business licenses, 58.4 per cent, as against 51.7 per cent in 1924. The increased license revenue was due to higher receipts from the sale tax on gasoline and from tax on steam and electric railroads. Receipts from licenses included those from incorporated companies, from the gasoline sales tax and from the motor vehicle license tax.

The net indebtedness of the State on June 30, 1925 was \$100,072,575, or \$25.22 per capita, as against \$23.83 per capita in 1924 and \$12.19 in 1918. The assessed valuation of property subject to tax was not rendered, for the reason that no general property tax is levied for State purposes when other sources of revenue suffice.

TRANSPORTATION. The total mileage of road line Dec. 31, 1925 was 8288.07. There were constructed in 1926, 25 miles of first track and 6 miles of second track; in all, 31 miles of track. The Mojave and Northern abandoned 7 miles of line.

EDUCATION. The failure of Governor Richardson to gain a renomination in the State primaries was regarded as having an important bearing on educational progress in California. He had been opposed by leaders in the educational organization as unfriendly to the policies that they sponsored. Consequently his defeat was interpreted as strengthening the prospects of a liberal State policy. By the passage of a constitutional amendment the Legislature was authorized to effect a classification and organization of school districts, with a view to correcting anomalies and uncertainties in the existing district system. According to Anna G. Fraser, State director and vice-principal of the Oakland High School, as quoted in the "Annual Roll Call" of the *Journal of the National Education Association*, there was rapid development of the junior college idea in California during the year.

The total enrollment of pupils in all public schools of the State in 1926, as reported by the State Department of Education, was 1,183,474. Elementary school enrollment was 691,-

534; that in high schools, 394,010. There was expended for public education in the State, including outlay for sites and school buildings, \$145,593,683. Salaries of teachers averaged in the regular elementary schools, \$1698, and in the regular high schools, \$2288.

CHARITIES AND CORRECTIONS. The Department of Institutions, established July 29, 1921, has general charge of the correctional and charitable institutions. The former State Board of Charities and Corrections, renamed in 1925 the Department of Public Welfare, coexists and co-operates with it. The two chief penal institutions of the State are the San Quentin State Prison, which reported 3512 inmates late in 1926 and the Folsom State Prison, at Represa, 1764 inmates. The six State hospitals for the insane and the numbers of their inmates were as follows: Agnews State Hospital, at Agnews, 1840; Mendocino State Hospital, at Talmadge, 1126; Napa State Hospital, at Napa, 2845; Norwalk State Hospital, at Norwalk, 1246; Southern California State Hospital, at Patton, 2632; Stockton State Hospital, at Stockton, 3017. A school for mental defectives, the Sonoma State Home, at Eldridge, had 2113 inmates. Of the three State schools for delinquents, the Whittier State School, at Whittier, had 320 inmates, the Preston School of Industry, at Lone, 574, and the Ventura School for Girls, at Ventura, 172.

POLITICAL AND OTHER EVENTS. At the election of November 2, C. C. Young, the lieutenant-governor and Republican candidate for governor, was elected over the Democratic candidate, Justus S. Wardell, by a plurality of not far from 200,000. Wardell advocated measures opposed to alcoholic prohibition. He had gained the primary nomination despite the opposition of W. G. McAdoo, and was regarded as against the proposal to nominate McAdoo as Democratic candidate for president in 1928. Samuel M. Shortridge, Republican, was reelected to the United States Senate, by a large plurality. He defeated John B. Elliott, Democrat, who was supported by W. G. McAdoo and the Anti-Saloon League. Voters of the State gave a majority against a referendum proposal to the effect that the Wright act, the State's prohibition enforcement law, be repealed. The vote reflected sharp division of sentiment between sections of the State. San Francisco voted heavily for the proposal to repeal, while in the southern portion of the State the sentiment in favor of the law prevailed. The State officers elected in November, 1926, to take office in 1927, were: Lieutenant-Governor, Burton Fitts; Secretary of State, Frank C. Jordan; Treasurer, Charles G. Johnson; Comptroller, Ray L. Riley; Attorney-General, U. S. Webb; Surveyor-General, W. S. Kingsbury; Superintendent of Public Instruction, Will C. Wood.

Litigation as to liability for the tax on community property under the State law was carried to the United States Supreme Court, which reversed the District Court of the Northern District of California, and on January 4 declared the tax assessable entirely against the husband, instead of its being divided between husband and wife. There started at San Francisco in April a strike of carpenters which led to a series of acts of violence in the building trade. A citizens' committee of 100 called on Mayor Rolph on September 28 to protest against the disorders and demand that they be terminated. The wage board of three members formed to

make annual adjustments in the pay scale of the building industry held hearings and reported December 9, recommending an increase of \$1 a day for bricklayers to \$11; of \$1 a day to carpenters, to be paid \$9; and of many other increases of \$1 a day or over. Civil Service Commissioner David J. Reese in his biennial report published in December asserted that there was duplication of departmental activities in the State government, and urged a retirement and pension law for State employees. A number of cities in the State adopted the uniform vehicular traffic regulations previously proposed. The State corporation department instituted an investigation into the activities of the California Olive Growers, Inc., in the cooperative marketing of the olive crops of the three preceding years. Effort was made to trace the disposal of some 5,000,000 pounds of olives of which it was asserted that the corporate books did not present a satisfactory account. The San Francisco Chamber of Commerce reported December 2 that it had conferred with the Federal Board of Engineers for Rivers and Harbors with a view to obtaining a survey of San Francisco harbor, preparatory to the removal of obstructions to navigation and the clearing of a channel 2000 feet wide and from 35 to 40 feet deep to the waterfront.

**OFFICERS.** Governor, Friend William Richardson; Lieutenant-Governor, C. C. Young; Secretary of State, Frank C. Jordan; Treasurer, Charles G. Johnson; Comptroller, Ray L. Riley; Attorney-General, U. S. Webb; Adjutant-General, Richard R. Mittelstaedt; Surveyor-General, W. S. Kingsbury; Superintendent of Public Instruction, Will C. Wood; Commissioner of Corporations, E. M. Daugherty; Librarian, Milton J. Ferguson; Legislative Counsel, T. M. Gannon; President Railroad Commission, Clyde L. Seavey; Chairman Industrial Accident Commission, John A. McGilvray; Commission of Insurance, George D. Squires; Chairman Highway Commission, Harvey M. Toy; Director Department of Agriculture, G. H. Hecke; Labor Commissioner, Walter G. Mathewson.

**JUDICIARY.** Supreme Court: Chief Justice, Louis W. Myers; Associate Justices, William P. Lawler, Thomas J. Lennon, William H. Waste, Emmet Seawell, John E. Richards, John W. Shenk.

**CALIFORNIA, UNIVERSITY OF.** A coeducational institution of higher education at Berkeley, Cal., with branches at Los Angeles, San Francisco, Davis, Riverside, and La Jolla; founded in 1868. The number of full-time resident students in courses leading to degrees, on Nov. 1, 1926, was 16,880, of whom 7889 were women and 8991 were men. The Extension Division had, in 1925-26, an enrollment of 36,021. For the summer school of 1926, 10,663 students registered. At the beginning of the fall term there were approximately 1500 members of the teaching staff. The endowment funds for 1925-26 amounted to \$10,506,506.06, and the income for the year to \$432,054.73, divided as follows: for current use, \$371,356.73; addition to funds, \$36,367.98; payment on trust funds, \$24,330.02. The library contained 638,993 volumes. During the year, Los Angeles County and cities in the county, presented the University with a new site of 382 acres valued at approximately \$3,500,000, for the Southern

Branch. A bond issue providing \$6,000,000 was voted by the people of California on November 2, to be divided equally between the University at Berkeley and the Southern Branch at the new Westwood site. An agricultural engineering building at the branch of the College of Agriculture at Davis, was under construction, the cost to be about \$140,000. President, William Wallace Campbell, Sc.D., LL.D.

**CALVERT, LORD BALTIMORE; CELEBRATION BY CALVERT ASSOCIATIONS.** See CELEBRATIONS.

**CAMBODIA.** A French protectorate of Indo-China lying to the north of Cochin-China, west of Annam, and south of Laos and Siam. Area, 67,550 square miles; population at the census of 1924, 2,465,581, of whom 1581 were Europeans (excluding the military forces). Pnom-Penh, with a population of 90,080, is the capital and chief town. The soil is very fertile but only a comparatively small area is under cultivation. The chief product is rice, its annual export amounting to about 250,000 tons. The other products include cotton, pepper, kapok, salt fish, hides, cattle, coffee, sugar, and iron. The imports in 1924 were valued at 32,036,186 francs and the exports at 13,753,000 francs. The budget for 1925 balanced at 8,856,882 piastres. Nominal king at the beginning of 1926, Sisowath, who succeeded in 1904. Cambodia is one of the five component states of French Indo-China, to which article reference should be made.

**CAMBRIDGE, ADA** (MRS. GEORGE FREDERICK CROSS). Australian novelist and poet, died at Melbourne, Australia, July 20. She was born at Wiggenhall St. Germain's, Norfolk, England, Nov. 21, 1844, and lived in Norfolk and Cambridgeshire until 1870, when she married the Rev. G. F. Cross and went with him to Australia where she resided in Victoria, mainly in bush districts, and later in Williamstown, a part of Melbourne, where she lived from 1893-1912. Among her writings a volume of poems, *The Hand in the Dark* (1913) was marked by sensitiveness and sympathy and was full of deep feeling. Her novels, however, were considered more important, her best stories being: *A Marked Man* (1891); and *Not All in Vain* (1892). In 1903 she published *Thirty Years in Australia*, and in 1912 after revisiting England, *The Retrospect*.

**CAMEROON or CAMEROONS.** See KAMERUN.

**CANADA.** A dominion of the British Empire in North America, bounded on the north by the Arctic Ocean, on the south by the United States, and on the east and west by the Atlantic and Pacific Oceans, respectively. Capital, Ottawa.

**AREA AND POPULATION.** The total area is placed at 3,797,123 square miles, of which 3,654,200 is land area and 142,923 water area. It consists of nine provinces, each with its own parliament and administration, and two territories, viz., the Northwest Territory and Yukon Territory, each under a commissioner, assisted by a council. According to the census of 1921, the total population was 8,788,483 as compared with 7,206,643 in 1911.

The accompanying table from the *Canada Year Book* for 1925 shows the areas of the provinces, etc., with the population at recent censuses:

Province	Land area sq. miles	Water area sq. miles	Total area sq. miles	Population, 1901	Population, 1911	Population, 1921
Prince Edward Island .....	2,184	.....	2,184	103,259	93,728	88,615

The religious denominations in the order of their numerical importance in 1921 were: Roman

Canada as a whole are shown in the accompanying table, an extract from the Survey of Education in Canada by the Dominion Bureau of Statistics, for 1925.

EDUCATION. Higher education in Canada is carried on in 23 universities and 82 colleges, including 21 classical colleges in Quebec. Of the universities six are state-controlled (New Brunswick, Toronto, Manitoba, Saskatchewan, Alberta, and British Columbia); four others are undenominational (Dalhousie, McGill, Queen's, and Western); while the remainder are denominational. The 23 universities had 3864 professors and 49,843 students in 1924-25. Some of the undenominational universities receive state assistance. The denominational universities include: King's, Acadia, and St. Francis Xavier in Nova Scotia; Mt. Allison in New Brunswick; Laval and Bishop's College in Quebec; and McMaster and Ottawa in Ontario.

Provinces	Year ended	Schools *	Teachers	Pupils	Expenditure Dollars

\* Where possible the number of school-houses is given, and elsewhere the number of school districts with schools in operation.

AGRICULTURE. The accompanying table from *Canadian Monthly Bulletin of Agricultural Statistics* for March, 1926 shows the estimated agricultural wealth and production for 1925:

	Value in thousands of dollars
Land .....	3,316,061
Buildings .....	1,832,684
Implement and machinery .....	665,172
Live stock .....	704,287
Poultry .....	47,171
Animals on fur farms .....	9,000
Agricultural production .....	1,708,567
Total .....	7,832,942
	Production in thousands of dollars
Field crops .....	1,153,395
Farm animals .....	151,424
Dairy products .....	253,269
Poultry and eggs .....	69,675
Fruits and vegetables .....	52,667
Miscellaneous .....	28,127
Total .....	1,708,567

The number of livestock in 1925 was as follows:

#### LIVESTOCK IN CANADA, JUNE, 1925

	Number	Value 1,000 Dollars
Horses .....	3,554,041	245,784
Milch cows .....	3,830,175	193,989
Other cattle .....	5,477,123	168,037
Total cattle .....	9,307,298	862,026
Sheep .....	2,755,556	26,795
Swine .....	4,426,148	69,702
Poultry .....	43,133,969	47,171
Total .....		751,458

In the same year (1925) there were 3012 creameries and cheese factories and 24 condensed milk factories. The total value of all the products of the dairy factories was \$138,282,226.

#### PRELIMINARY ESTIMATE OF THE YIELD OF WHEAT, OATS, BARLEY, RYE, AND FLAX, AUGUST 31, 1926, AS COMPARED WITH THE FINAL ESTIMATE OF 1925

Sugar beets .....	9.67	98	9.45	47,494	458,200	449,000

NOTE: For condition, 100 = average yield per acre, 1916-1925.

## DAIRY PRODUCTION, 1925

Products	Quantity 1,000 lbs.	Value 1,000 dols.
Dairy butter .....	100,000	29,347
Creamery butter .....	169,495	63,008
Home made cheese * .....		77
Factory cheese .....	177,189	36,572
Condensed and other factory products .....		38,703
Milk used fresh * .....		64,400
Total .....		

\* Figures for 1924.

Fruit farming is of considerable importance, the chief product being apples, although peaches, pears, plums, cherries and small fruits are grown in abundance. The apple crop in 1925 totaled 3,580,770 barrels as compared with 3,375,084 barrels in 1924. The 1925 wool clip was estimated at 15,553,045 pounds valued at \$4,199,000. In the same year 27,815 acres were under tobacco (chiefly in Ontario and Quebec). The production was 29,255,000 pounds valued at \$7,002,400.

## STATISTICS OF FUR FARMS AND FUR PRODUCTION, 1925

	Number	Value
Fur farms .....	2,268	
Land and buildings .....		\$3,282,671
Fur-bearing animals on farms .....	50,536	9,793,377
Silver foxes on farms .....	41,787	9,432,097
Animals sold alive off farms .....	15,906	2,885,710
Pelts sold off farms .....	11,227	775,906
Pelts produced in Canada by hunting, trapping, and farms .....	3,820,326	15,441,564

FORESTRY. The accompanying tables supplied by the Forest Products Branch of the Dominion Bureau of Statistics give the latest available information on the various phases of forests and forest production:

## PRIMARY FOREST PRODUCTION, 1924

	Unit	Quantity	Equivalent in standing timber 1,000 cu. ft.	Value 1,000 dollars
Logs, bolts, square timber .....	M. ft. B. M.	5,019,148	1,099,193	91,314
Pulpwood .....	cords...	4,647,201	543,722	57,778
Firewood .....	do...	9,117,680	866,180	39,837
Ties, poles, mining timber, posts, etc. ....			247,495	20,583
Miscellaneous .....			51,915	4,134
Total .....			2,808,506	213,147

## MINERAL PRODUCTION, 1925, AND (ESTIMATED) 1926

Product	Quantity 1925	Value *	Quantity 1926	Value *
<b>Metals:</b>				
Gold .....	fine ounces	1,735,785	1,729,377	\$35,749,000

Petroleum, crude .....	barrels..	332,001	1,250,705	339,000
Salt .....	do.	233,746	1410,697	245,000
Other non-metals .....	do.		1,717,192	1,908,000
Total .....		71,851,801		83,005,000
<b>Structural materials and clay products:</b>				
Cement .....	barrels..	8,116,597	14,046,704	8,615,749
Bricks and other clay products .....			9,529,691	11,000,000
Lime .....	bushels..	10,256,542	3,387,652	4,000,000
Stone, sand, and gravel, etc. ....			10,685,187	11,800,000
Total .....		37,649,234		40,000,000
Grand total .....		226,538,338		242,886,000

\* The metals copper, lead, and silver, are, for statistical and comparative purposes, valued at the final average value of the refined metal. Pig-iron is valued at the furnace. Non-metallic products are valued at the mine or point of shipment, and structural material and clay products at the point of shipment.

Of the foregoing the principal items of export in the raw state were: Logs, bolts, square timber, 416,157 M. ft. B. M. valued at \$8,172,523; pulpwood, 1,330,250 cords valued at \$13,536,058. The estimated stand of merchantable timber in Canada in 1000 cu. ft. was:

	Saw material	Pulpwood, firewood, etc.	Total
Softwood ...	96,326,708	102,083,260	198,409,968
Hardwood ..	9,247,797	39,168,567	48,416,364
Total ...	105,574,505	141,251,827	246,826,332

## LUMBER PRODUCTION, 1924

[Statistics of the industry]

The principal woods used for lumber and lath were spruce, douglas fir, and white pine, and for shingles, cedar.

MINERAL PRODUCTION. The accompanying table from the Dominion Bureau of Statistics shows the principal metals and minerals produced in 1925 and estimates for 1926 with their values:

**FISHERIES.** In 1925 the total value of the fisheries of Canada was \$47,926,802. The principal kinds of fish marketed were: Salmon, \$15,760,630; cod, \$6,232,821; lobsters, \$5,552,977; halibut, \$4,185,301; herring, \$3,117,841; whitefish, \$1,974,871; haddock, \$1,171,555; trout, \$1,097,728; pickerel, \$1,056,109; smelts, \$1,035,504; and sardines, \$1,017,206. In 1925-26 the exports were valued at \$36,792,663. The number of persons employed in 1925, including those in shore work and canneries, was 73,855. In 1925 the number of canneries in operation was 852.

**MANUFACTURES.** The accompanying table from the *Canada Year Book* for 1926 shows the number of establishments, the capital, the number of employees, and the amount of their salaries and wages, the cost of materials, and the value of products in 1924, in various groups of industries:

Group of industries	Number of establishments	Capital Dollars	Employees		Cost of materials	Value of products
			Number	Salaries and wages Dollars		
Vegetable products . . . . .	4,414	414,922,612	66,183	70,638,304	365,614,854	585,945,602
Animal products . . . . .	4,816	208,466,666	57,779	53,270,202	269,993,396	379,777,322

**COMMERCE.** The trade by principal countries for the years ended Mar. 31, 1925 and Mar. 31, 1926, according to the condensed preliminary report on the trade of Canada, 1926, published by the Dominion Bureau of Statistics is as follows:

Of the 80 chief imports 70 showed increases in the year ended Mar. 31, 1926, and 10 showed decreases. The decreases occurred in the imports of coal, sugar, woolen goods, cotton goods, settlers' effects, raw wool, dyeing and tanning materials, molasses, clocks and watches, and fish. While some of these commodities showed decreases in value the quantities imported showed increases—notably coal, molasses and sugar, the quantities of coal increasing from 15,071,035 tons to 16,651,014 tons, molasses from 5,063,114 gallons to 6,058,389 gallons and sugar from 882,329,494 pounds to 1,174,443,304 pounds. The importer, therefore, obtained these products in the markets of the world at a lower price per unit than in the preceding year. The increases in the 70 commodities were not wholly due to higher prices, but as well to increased quantities imported, the only notable exception being

in the case of raw rubber, the average import value of which in 1925 was 28.5 cents per pound and in 1926, 68.3 cents per pound. In the case of other commodities that showed increases in value the average import value in 1926 was on the whole on a par with that for 1925, with

**TRADE OF CANADA WITH TWENTY-FIVE LEADING COUNTRIES, YEAR ENDED, MARCH 31, 1926**  
(Countries arranged in order of importance of trade)

NOTE—The figures in parentheses opposite each country indicate percentage of total imports or exports in 1925, while the sign (+) indicates that the imports or exports in 1926 were greater than in 1925.

\* Excluding coin and bullion.

the possible exception of that for hides and skins, woollens, jute cloth and certain classes of foodstuffs. Fifteen commodities imported account for about 46 per cent of Canada's imports. These articles in order of importance were: Coal, 6 per cent of the total imports; sugar, 3.5 per cent; woolen goods, 3.5 per cent; machinery, 3.4 per cent; raw rubber, 3.4 per cent; cotton goods, 3.3 per cent; crude petroleum, 3.2 per cent; raw cotton, 3.1 per cent; fruits, 3 per cent;

alcoholic beverages, 2.7 per cent; automobile parts, 2.5 per cent; iron and steel plates and sheets, 2.4 per cent; silk goods, 2.3 per cent; electric apparatus, 1.7 per cent; and automobiles, 1.7 per cent.

The 50 principal exports make up 91.8 per cent of the Dominion's exports. Of these exports 39 showed increases and 11 decreases for the year ending Mar. 31, 1926. The commodities to show decreases were: Wheat flour, raw gold,

pulpwood, settlers' effects, unmanufactured leather, raw hides and skins, apples, rye, condensed milk, coal, and bran, shorts and middlings. In every instance where the values in 1926 were less than in 1925, the quantities exported showed a corresponding decrease, except in the case of coal. Those commodities showing an increase in value, 1925 to 1926, showed a corresponding increase in the quantities, except in the case of silver ore, shingles, and butter. There were no abnormal changes in the average export values from 1925 to 1926 except for potatoes, the export value of which increased from about 74 cents per bushel to about \$1.32 per bushel. Ten commodities exported in 1926 accounted for over 62 per cent of the increase in the Dominion's exports. These commodities arranged in order of importance were: Wheat, 27.7 per cent of the total exports; printing paper, 7.8 per cent; wheat flour, 5.3 per cent; planks and boards, 5 per cent; wood pulp, 3.8 per cent; meats, 2.8 per cent; fish, 2.7 per cent; automobiles, 2.7 per cent; cheese, 2.5 per cent; and raw gold, 1.9 per cent.

Canada's foreign trade during the calendar year 1926, was valued at \$2,292,281,000, a figure that had been exceeded in only three previous years. Inasmuch as values had decreased since 1920 it seemed reasonably certain that the 1926 volume was the largest ever attained. The increase of \$118,980,000 over 1925 was due to the remarkable advance in imports, they having aggregated \$1,008,342,000, in contrast to \$890,193,000 during the preceding year. Imports increased principally because of the much heavier requirements of Canadian industries for raw and partly manufactured materials, but a general expansion in the purchasing power of Canadian consumers was an important factor. Domestic exports showed a slight valuation decline to \$1,268,582,000 from the 1925 total of \$1,270,987,000. The export volume was affected by the industrial difficulty in Great Britain, which country took smaller quantities of agricultural products from Canada, and by the extremely high ocean freight rates, accompanied by the diversion of vessels to the coal trade during the latter part of the year.

\* Not available as yet.

Total income tax collections in Canada during the fiscal year 1925-26 were \$56,197,000, of which Montreal and Toronto alone paid \$29,412,000. Other cities in each of which more than \$1,000,000 was collected included Vancouver, Winnipeg, Ottawa, Calgary and Quebec.

Commercial failures in Canada and Newfoundland during 1926, numbering 2196 with total liabilities of \$37,083,000 were the lightest since 1920, and they compare favorably with the 1925 record of 2371 insolvencies aggregating \$45,768,000.

SHIPPING. The vessels entered and cleared at Canadian ports on inland waters between Canada and the United States were: Canadian, 26,653 of 18,654,786 tons; United States, 66,770 of 18,303,239 tons. The inland waterway system in Canada by lakes, rivers, and canals has a length of over 2700 miles. Down to 1925, \$163,787,855 had been spent on canals for construction and enlargement alone. In 1925, 31,948 vessels of 18,789,709 tons passed through the Canadian canals.

RAILWAYS. The accompanying table gives the statistics on steam railways, telegraphs and telephones in the Dominion for the calendar years 1924 and 1925:

ment of coal by 114,000 cars; of miscellaneous freight by 60,000 cars; and of merchandise by 50,000 cars. According to the *Railway Age*, there was not a great deal of new railway construction in Canada during the year. Work was proceeding on the completion of the Hudson Bay Railway, which has been demanded by the Prairie interests anxious for a short haul for export grain—this in spite of the fact that many observers expressed the opinion that the route would not be worth much, since the bay would be blocked by ice during the period of the heaviest Canadian grain movement. The Canadian roads greatly increased their purchases of new equipment in 1926 over the year previous. Locomotive orders totaled 61 as against only 10 in the preceding year; 236 passenger cars were ordered compared with 50 in 1925; and 1926 orders for freight cars reached a total of 1495, as compared with 642 in the year preceding. The roads are continually carrying on branch line construction, several hundred miles being completed during 1926. In addition the Canadian National standardized the gauge of 143 miles of line on Prince Edward Island and improved terminal facilities and provided new structures at a number of points. The Canadian

Pacific built a new \$5,000,000 pier at Vancouver, B. C.; built a new hotel at Regina, Sask., at a cost of \$2,000,000; added a new wing to its hotel at Banff, Alta., at a similar cost; rebuilt burned sections of the Chateau Frontenac at Quebec City at a cost of \$1,500,000; and undertook several important bridge renewals.

**GOVERNMENT.** Executive power is exercised in the King's name by the Governor-General of Canada, acting through a responsible ministry or cabinet. Legislative power is in a parliament of two houses: a Senate and a House of Commons, the former consisting of 96 members appointed for life and the latter of 245 members under the representation bill of 1924, elected by popular vote including woman suffrage. Women are eligible for election to parliament. The Governor-General at the beginning of the year was Lord Byng of Vimy. He was succeeded during the year by Lord Willingdon of Rotton, appointed Aug. 5, 1926. For the changes in the cabinet see paragraphs on History below.

### HISTORY

**FORMATION OF A GOVERNMENT.** As noted in the preceding YEAR BOOK, the elections held in Canada in October, 1925, resulted in no party obtaining a numerical majority. The Conservatives gained at the expense of the Liberals and Progressives, but it was questionable whether they could get enough members from the other parties to form a satisfactory government. Prime Minister King had been defeated himself for reelection, although he was later seated as a result of a by-election. The new Parliament met at Ottawa on January 7 and the balance of power was held by the Progressive group under the leadership of Robert Forke. The Governor-General's speech, according to the press, was so framed so as to include items which would be favorable to the Progressive group and thus compel it to swing its support one way or the other so that government could continue. Among the main items of the speech were advocacy of completion of the Hudson Bay Railroad, establishment of rural credits, the appointment of a tariff commission, reduction of taxation, restrictive immigration measures aimed to protect the agriculturalist, the consolidation of government departments, and the possible consolidation of the debt of the Canadian National Railways.

On January 15, when the Conservative Party demanded a vote of "no confidence" in the government the Progressive Party gave its aid to Premier W. L. Mackenzie King, and enabled him to keep a precarious control of the government. The Conservatives under the powerful leadership of Arthur Meighen, made several moves to win over the support of the Progressive group but failed each time. One of the first acts of the Parliament, and one which was to play an important part later on, was that providing for an investigation of the management of the Canadian Customs Service, which were declared to be honeycombed with corruption. Parliament adjourned on March 15.

**RESIGNATION OF THE KING MINISTRY.** On June 28, the ministry of W. L. Mackenzie King resigned office after Governor-General Byng had refused to dissolve parliament. The chief reason for the resignation was the damaging evidence which had resulted from the customs investigation mentioned above. Governor-General Byng

requested Arthur Meighen, the leader of the Conservative group, to organize a cabinet. Mr. Meighen did so, but after obtaining a vote of confidence was defeated on the first government measure placed before Parliament. The leader of the Conservative Party immediately effected the adjournment of parliament which was later dissolved by the Governor-General. The Conservative cabinet which carried on the business of government until a new parliament had been elected was composed as follows: Prime Minister and Secretary for External Affairs, Arthur Meighen; State, Sir George Perley; Finance, R. B. Bennett; Defense, Hugh Guthrie; Justice, E. L. Patenaude; Customs, H. H. Stevens; Agriculture, S. F. Tolmie; Railways, W. A. Black; Postmaster-general, R. J. Manion; Trade and Commerce, J. D. Chaplin; Labor, George B. Jones; Public Works, E. B. Ryckman; Without Portfolio, Sir Henry Drayton, Donald Sutherland, H. D. Morand, and John A. MacDonald. The general election was to be held on September 14, with the main issue according to the Liberal Party, the constitution, and on the Conservative side, the customs scandal.

**NEW GOVERNOR-GENERAL.** On October 2, Lord Willingdon, the new Governor-General for Canada, was sworn into office. Lord Byng, the retiring Governor-General, issued the following statement upon his return to England: "From now on there is going to be union between Canada and the United States, but it is only going to be a union of friendliness. Canada is not growing more American. Canada is all British. I am going to do my best now to contradict the false idea that the Dominion is breaking away from the Empire sentiment. That is the effect of extremist propaganda. Canada from coast to coast is very imperialistic. After some years of post-war chaos she is on the eve of great prosperity. You can tell that by the fact that American farmers are crossing the borders from the States and settling anew on the rich lands of the Canadian West. That is symptomatic of the whole feeling between the Dominion and her southern neighbor."

**THE ELECTIONS.** As stated above the elections for the new parliament were held on September 14. In the field there were 528 candidates for the 244 seats. Only one seat, in Manitoba, was uncontested. The Conservatives had 233 candidates in the field, the Liberals, 199, Progressives, 20, Independents, 25, Labor, 18, United Farmers of Alberta, 12, Liberal-Progressives, 21. The Liberal Party supported other contestants in 48 districts to prevent a three-cornered fight and thereby assure the election of a Conservative. Mr. King in leading the fight of the Liberals pointed out the prosperity of the country under their leadership and bitterly attacked the action of Lord Byng in refusing to grant a dissolution of Parliament to him, while he did grant one to Mr. Meighen.

In Mr. Meighen's campaign he stressed again and again the customs scandal which had been unearthed and accused King of too strong a friendship for the United States. On the tariff issue neither King nor Meighen was very definite. If either one was speaking in a protectionist district, he was protectionist, and if speaking in a free trade district, his remarks could be construed as leaning toward free trade. The campaign was sullied by the usual personal attacks on the character and habits of

the leaders of the two parties and every trick known to a political campaign was resorted to in an effort to gain the election. Campaign funds were freely raised and freely spent, with the usual charges and counter-charges against what in the United States is called "the interests."

The result of the election was an overwhelming defeat for the Conservatives and a failure on the part of the Liberals to gain an absolute numerical majority. The Liberals obtained 119 seats, Conservatives, 91, Progressives, 8, Liberal-Progressives, 11, United Farmers of Alberta, 11, Labor, 3, Independent, 2. Arthur Meighen and six of his cabinet were defeated. British Columbia, Nova Scotia, Ontario, and New Brunswick supported Meighen, but he received only one seat in the Prairie Provinces. Ten days after the election, the Meighen cabinet resigned and on September 25, the following Liberal cabinet was sworn in: Prime Minister and Minister of External Affairs, W. L. Mackenzie King; Finance, J. A. Robb; Justice, Ernest La Pointe; Railways, C. A. Dunning; Interior, Charles Stewart; Public Works, J. C. Elliot; Agriculture, W. R. Motherwell; Trade and Commerce, James Malcolm; Customs and Excises, W. D. Euler; Health, Dr. J. H. King; Immigration, Robert Forke; Postmaster-General, P. J. Veniot; Marine and Fisheries, P. J. A. Cardin; Solicitor-General, Lucien Cannon; Secretary of State, Fernand Rinfret; Labor, Peter Heenan; Without Portfolio, Senator R. Dandurand. On November 2, 14 members of the King cabinet were re-elected to parliament in accordance with the provision that makes it necessary for members appointed to the ministry to stand for re-election.

On November 10, Vincent Massey, a wealthy manufacturer, was appointed Canadian Minister to Washington. This was the first time this post has been filled.

**CANADA, UNITED CHURCH OF.** On June 10, 1925, the Congregational churches, the Methodist Church, and the Presbyterian Church in Canada united to form a single body under this designation. The final union of all Presbyterian churches in Canada had occurred in 1875 and of all Methodist churches in Canada in 1884. Negotiations looking to the union consummated in 1925 had proceeded for over 20 years, a basis of union having taken substantially its final form in 1900. Legislation ratifying the union to which the churches had agreed was sought by their highest courts and granted by the Parliament of Canada in 1924 under the title, "United Church of Canada Act." Latest statistics available, those of 1925, gave the church membership as 692,348 communicants. There were 11 conferences, 113 presbyteries, 8806 congregations with 4536 ministers and 1946 lay preachers. The church maintained 26 colleges. The official organ is the *New Outlook*, while the *United Churchman* gives special service in the Maritime Provinces. The *Record and Missionary Review* is a monthly of great value throughout the Church.

The second General Council convened in the American Church, Montreal, June 10-20, 1926, the first anniversary of the formation of The United Church of Canada. The major portion of the session was devoted to framing constitutions for the Executive Committee of the General Council; for the principal Boards, the

Board of Foreign Missions, Board of Home Missions, Board of Education, Board of Evangelism and Social Service, Board of Religious Education, and Board of Publications; and for the Committees on Finance; on Literature, General Publicity and Missionary Education; and on Maintenance and Extension Fund. Progress was reported in negotiations looking toward organic union with the Reformed Episcopal Church and the Evangelical Church, and communication with other ecclesiastical bodies in Canada was noted. The next General Council was to be held in Winnipeg, Manitoba, in September, 1928.

In October and November, the Very Rev. James Harvey, D.D., Ex-Moderator and Senior Principal Clerk of the General Assembly of the United Free Church of Scotland, made a visitation of the United Church of Canada from Newfoundland to British Columbia, speaking in the principal cities. In November the Moderator, the Rev. James Endicott, D.D., and the Editor of *The United Church Record and Missionary Review*, the Rev. W. T. Gunn, D.D., by appointment of the Church, went to India to attend celebrations of the Golden Jubilee of the Central India Mission, founded in 1876 by the Presbyterian Church in Canada and carried on since 1925 by The United Church of Canada.

In its first financial year ended Mar. 21, 1926, The United Church asked its people for \$4,000,000 for current expenses and received \$4,075,000, an amount largely exceeding the budget receipts of the Churches before union. The budget for the year 1926-27 amounted to \$3,400,000. Officers elected for 1926-28 were: Rev. James Endicott, D.D., moderator; Rev. T. Albert Moore, D.D., secretary of the General Council. The secretary's offices are 421 Wesley Buildings, Toronto 2, Ontario.

**CANALS.** Late in the year Secretary Hoover of the U. S. Department of Commerce expressed his advocacy of a vast interconnected waterway system to connect the Great Lakes with the Atlantic Ocean and to reach inland by way of numerous rivers and canals. This advocacy of the Secretary's was in rather general terms, and, while it was applied to various projects by their supporters, it seemed to deal in the main with increased facilities for transportation. Such proposals were brought up in Congress and often were advanced in the face of the opposition of the technical advisers of the Government.

Late in the year the Chief of Engineers of the United States Army submitted to the Committee on Rivers and Harbors of the U. S. House of Representatives a report on the Great-Lakes-to-Hudson Canal, in response to a request from that committee that the Board of Engineers for Rivers and Harbors extend the scope of the earlier investigation to a revision of the proposed canal across New York State, so that a canal with a depth of 30 feet might be considered in view of later evidence and estimates. Previously an adverse report had been made on a waterway for vessels of 20 to 25 feet draft, and the report of 1926 also was adverse to a 30-foot channel, the conclusion reached being that the economic benefits would not be commensurate with the cost of construction, and that the expenditure of public funds on the St. Lawrence River route would bring greater returns per dollar expended. While the route from the Great Lakes to the Hudson River was feasible from an engineering point of view and might be consid-

ered if the plan for the improvement of the St. Lawrence waterway was not carried into execution, it was believed that the deepening of the present canal and the construction of a 30-foot channel in the Hudson River were hardly worth the expenditure involved, and particularly in comparison with the cost of improving the St. Lawrence route for navigation.

The United States Corps of Engineers also opposed the canalization of the Missouri River above Kansas City, recommending the possible postponement of the complete project and the construction of satisfactory bank protection work, which would become part of the project for canalization when developed. The Chief of Engineers recommended that local interests should contribute to the bank improvement and that construction should not be undertaken until there was greater expectation of the project becoming a paying proposition.

During the year the joint Board of Engineers appointed by the Canadian and United States Governments to advise the National Committee of the two Governments in reference to the development of the St. Lawrence River made a report on this project reviewing a previous joint report of 1921 and answering various questions which were presented to them for consideration. This report discussed the various engineering features, the increased cost under modern conditions, the diversion of water and change of levels, the changes in international boundary, and similar matters. The Board recommended, in connection with the improvement of the river, a navigation route through the 183 miles of river and lake from Lake Ontario to Montreal Harbor, with a total of not more than 25 miles of restricted canal navigation and not more than nine locks. There should be but eight bridges across this channel, and power houses with an ultimate installed capacity of from 2,619,000 to 2,730,000 h.p. in the international section of the river, with a possibility of later development up to 5,000,000 h.p., which is the full power potential of the river. The Board discussed the cost of channel construction and maintenance, paying particular attention to the increase of costs required under conditions arising since the first report was presented.

**ILLINOIS WATERWAY.** The State of Illinois continued work during the year on this important link in the barge canal between the Great Lakes and the Mississippi River. This waterway was 63 miles in length from the Chicago Drainage Canal at Lockport to the Illinois River at Starved Rock. At Lockport the lock was 99 per cent completed at the end of the year, while at Starved Rock the lock was 20 per cent complete. The Marseilles lock was finished but the other two locks and the Marseilles diversion canal had not been undertaken. Contracts were let for the mitre gates for the Lockport and Marseilles locks in August, 1926, for delivery in 1927, and it was anticipated that the entire waterway would be completed by 1930. An open question at the end of the year was the provision of a nine-foot channel in the Illinois River from Starved Rock to the Mississippi River, which would be essential to the fullest realization of the project. This had not been authorized by the United States Government, which would be called upon for its construction.

**CHESAPEAKE AND DELAWARE CANAL.** At the end of the year the conversion of the Chesapeake

and Delaware Canal to a sea-level waterway was practically finished, the work having been carried on with but slight interruption to navigation. This involved extensive dredging operations which had been delayed by the sinking of a large dredge intended for service in the canal while en route to the project.

**WELLAND SHIP CANAL.** The last contracts for the remaining sections of the Welland Ship Canal between Lake Erie and Lake Ontario were let in 1926, and at the end of the year the whole project was under construction. It was expected that the harbor works at Port Weller and Locks Numbers 1, 2, and 3 would be completed in 1927. Work on the canal prism and on Locks Numbers 4, 5, 6, and 7 up to the top of the escarpment was about 75 per cent complete, with the lock work itself about 90 per cent complete at the end of the year. South from the flight of locks some portions of the canal were entirely finished and other sections were about 40 per cent complete. At the Port Colborne end, work was about 62 per cent complete, while at the various crossings the bridge work was advancing satisfactorily. In 1926 contracts were let for the construction of lock gates and it was expected that the entire canal would be ready for use on the opening of navigation in 1930. The total cost of the improvement of the Welland Canal was estimated at \$115,000,000. Up to the end of 1926, \$72,300,000 had been expended.

**MARSEILLES-RHÔNE CANAL.** This project, which involved the large Rove Tunnel, was completed during the year and made it possible for river traffic originating at Lyons and other interior points in France to pass from the Rhône River direct to Marseilles without the twenty-five mile trip into the Mediterranean waters to pass the cape west of the city. This canal and tunnel have been referred to in previous issues of the YEAR BOOK: the tunnel has a square invert, 59 feet wide and 15 feet deep with a semi-circular arch of 41 feet radius, which when excavated gave a section 79 feet wide and 50 feet high. The tunnel was  $4\frac{1}{2}$  miles long, passing through a mountain ridge north of the city, and had a water depth of about 10 feet.

See PANAMA CANAL; SAULT STE. MARIE, CANALS AT; SUEZ CANAL.

**CANARY ISLANDS.** A group of small islands off the northwest coast of Africa, belonging to Spain. Area, 2807 square miles; population, Jan. 1, 1925, estimated at 498,516. The capital is Santa Cruz de Teneriffe, with an estimated population in 1924 of 78,158. The next largest city is Las Palmas, with a population of 67,122 in 1920. The University of Seville maintains an educational establishment in the Canaries and is in charge of higher education. There is a regular steamship communication with Spain. The islands are under the administration of continental Spain through a local governor.

**CANCER.** It has now become possible to form some idea of the place to be occupied in the near future by the Blair Bell lead treatment to which reference was made in the YEAR BOOK for 1925. A summary of the subject by Professor F. C. Wood may be found in the *Journal of the American Medical Association* for September 4. The principle involved is by no means new, for it has long been observed that workers in lead appear to be free from cancer and the use of lead as an abortifacient indicates that it has a

selective hostile action on the embryo (embryonal cells have a similarity to cancer cells). As long ago as 1883 Nüssbaum, a German surgeon, injected lead salts into malignant tumors with benefit. Dr. Bell himself discovered many years ago that lead salts have a selective action on the product of conception in animals although he concluded that this action was exerted specially on the trophoblastic cells of the fertilized ovum which are not an integral part of the embryo but show pronounced analogies with cancer cells.

Since 1904 colloidal suspensions of various metals have been tested extensively on cancer but lead was not included among them, and it was only after Bell found that the crystalline salts of that metal were too dangerous for experimentation on human beings that he made trial of colloidal lead, about 1920. Generally speaking, colloidal metals act rather because of their physical state, as colloids, than from any specific property, but although the action differs some of the colloidal metals including lead have been found to be injurious unless given with care and under constant supervision.

As Dr. Bell is an operating surgeon, he has employed the lead treatment only in inoperable cases and does not use it to the exclusion of radiation but rather as a synergist of the latter. Even in inoperable cancer he performs partial excision if the growth is large. In other words, there is thus far no exclusive lead treatment although there may be at some future time.

The cases for the use of lead have been selected with great care and patients with damaged vital organs are excluded from treatment. Those treated are kept under strict hospital control with daily examinations of blood and urine. It has been found best to give rather large and well spaced injections, for small and repeated doses are not free from danger. Thus far Dr. Bell had treated 227 inoperable cases, all naturally with hopeless outlook and of this number 50 have survived from one to five years with the disease in arrest. While it would be premature to claim a radical advance, pathologists like Wood and the late Adami (q.v.) have pronounced the method sound in theory and promising in clinical results.

The rank and file of the medical profession, as well as the reading public, have been impressed with the silence which has followed the announcement of the Gye-Barnard discoveries in respect to the causation and possible rational treatment of cancer. This silence is only apparent, for there has been great activity in the study of Rous fowl sarcoma, the form of growth investigated especially by Gye and Barnard. According to an item in the public press Peyton Rous was to coöperate with the two British savants in a future research of the tumor which bears his name. In the *Lancet* for October 9, was to be found the report of Mackenzie and Illingworth on some research undertaken at Edinburgh University, which in essentials appears to bear out the conclusions of Gye. In the fluid portion of a Rous sarcoma culture were found two distinct principles, the pathogenic action of each being inert in inoculation experiments when taken singly. If the culture fluid contained both of these principles the fowls could be successfully inoculated. Little is known of the nature of either principle. For convenience one was called the "virus" and the other the "specific

factor." The virus is readily destroyed by chloroform while the specific is not. There is some evidence that other tissue fluids contain substances which can substitute for the virus in the inoculation experiments.

**CANNON, JOSEPH GURNEY.** Former United States congressman and for many years speaker of the House of Representatives, died at Danville, Ill., November 13. He was born at Guilford, N. C. May 7, 1836, and in 1858 was admitted to the bar in Illinois. From 1861-68 he was State's attorney in the 27th Judicial District of Illinois, for Vermilion County, and in 1873 he was elected as representative to the 43d Congress, serving continuously until 1891. In 1893 he was again elected from the 12th Illinois District serving from the 53d to 57th Congresses, and from the 18th District in the 58th to the 62nd Congresses, 1903-13, and in the 64th to the 66th Congresses, 1915-21. In 1890 along with Speaker Reed and Representative McKinley he drew up the "Reed rules" of the House which at the time aroused considerable discussion. He was chairman of the committee on appropriations in the 55th and 56th Congresses and in the 58th Congress was elected speaker, serving in this office until 1911, or through four Congresses. In that year Champ Clark, Democrat, succeeded him as speaker and in the following November, Mr. Cannon failed of reelection. He was again elected to Congress in 1915, retiring on Mar. 4, 1923, after serving for 46 years, during which period he was four times speaker of the House. In 1908 he received 58 votes for the presidential nomination at the Republican Convention. Speaker Cannon represented the old school of the Republican Party where party discipline prevailed and as speaker he ruled the House so as to secure party legislation, but with fairness to the minority. He had a dry fund of humor and was highly esteemed both in Washington and among his constituents.

**CANTLIE, SIR JAMES.** British physician and founder and first president of the Royal Society of Tropical Medicine, died at London, May 28. He was born at Keithmore, Dufftown, Banffshire, Scotland, January 17, 1851, and was educated at Milne's Institution, Aberdeen University, and Charing Cross Hospital, London, where he went to finish his medical education. In 1872 he was made demonstrator of anatomy at Charing Cross Hospital and in 1877 assistant surgeon, being appointed surgeon in 1887. He served as examiner for the University of Aberdeen, and went to Egypt with a cholera expedition in 1883. He went to China in 1887 spending nine years in that country and serving as dean of the College of Medicine for Chinese, 1889-96. His experiences in China brought him into contact with the diplomatic life of that country and he made many important friends. On his return to London he served as plague officer for the London County Council, and as consulting surgeon for the London, North Eastern Railway Company. From an early time he was interested in Red Cross work and at one time was a member of the Council of the Red Cross Society. He was a fellow of the Royal College of Surgeons and in 1918, was created K.C.B.E. (Knight Commander, Order of the British Empire); in 1921 he founded the Royal Society of Tropical Medicine and Hygiene of which he served as president for three years. Sir James was founder

and co-editor of the *Journal of Tropical Medicine*, and was consulting surgeon to the Seaman's Hospital Society. In October, 1896 when Sun Yat-sen, a refugee in London, was made a prisoner in the Chinese Legation, Cantlie exerted himself so that the Foreign Office intervened and secured his release. He was the author of several works including: *Naked Eye Anatomy*; *Beri-beri*; *Tropical Surgery*; *Gould and Warren's Surgery*; *Tropical Diseases*; *Allchin's Medicine*; *Plague*; *Degeneration amongst Londoners* (1885); *Physical Efficiency* (1906); and various sections in *Quain's Dictionary*; *Heath's Dictionary*; and *Treves' Surgery*.

**CAPE COLONY.** See CAPE OF GOOD HOPE PROVINCE.

**CAPE OF GOOD HOPE PROVINCE.** One of the four original provinces of the Union of South Africa; the southernmost province of the Union; formerly known as Cape Colony or the Colony of the Cape of Good Hope. Area, 276,968 square miles; population at the census of 1921, 2,782,719, of whom only 650,609 were European. The population at the census of 1911 was 2,564,965. The chief towns with their white population in 1921 are: Cape Town, 113,302; Kimberley, 18,288; Port Elizabeth, 25,982; East London, 20,374. The movement of population in 1924, so far as registered, was: Births, 56,324; deaths, 34,002; marriages, 14,268. In 1925 there were 123 local school districts. In 1923 there were 4419 aided schools with 137,723 European pupils, 167,861 non-European pupils, and 19,952 teachers. The trade between the province and the United Kingdom in 1925 was: imports into the United Kingdom from the province, £16,587,831; exports from the United Kingdom into the province, £13,238,168. The chief exports to the United Kingdom were wool, mohair, hides and skins, corn, and feathers; the chief imports from the United Kingdom were cotton and woollen goods, machinery, iron and steel goods, and paper. The administrator of the province in 1926 was Sir Frederic de Waal.

**CAPE VERDE, vûrd, ISLANDS.** A group of fourteen islands off the western coast of Africa belonging to Portugal. Area, 1480 square miles; population at the census of Dec. 31, 1922, 149,793, of whom 69,001 were males. The chief products are coffee, medicinal substances, hides, and millet. A small military force is maintained on the islands. The estimated public revenue in 1924 was 17,519,538 escudos and the expenditure, 17,505,454 escudos. Imports in 1924 amounted to 61,570,808 escudos and exports, 49,192,929 escudos. The chief port is Bissau. The administration is in the hands of a governor whose seat is at Praia, the capital.

**CARHART, DANIEL.** American civil engineer and educator, died at Pittsburgh, December 8. He was born in Clinton, N. J., Jan. 28, 1839, and after graduating in the civil engineering course from the Polytechnic College of Pennsylvania in 1859, practiced civil engineering until 1868 when he became assistant professor in the Polytechnic College of Pennsylvania, serving in that capacity and as professor until 1878. In 1882 he joined the faculty of the Western University of Pennsylvania, which later became the University of Pittsburgh, as professor of mathematics and civil engineering, being made dean of the collegiate and engineering departments in 1892. He acted in this capacity until 1908, when he retired as emeritus professor of

civil engineering. He was the author of several text books including: *Plane Surveying* (1888 and 1902) and *Field Book for Civil Engineers* (1893 and 1902).

**CARINTHIA.** Since the downfall of the Austro-Hungarian Empire a province of the new republic of Austria; formerly a crownland of the Dual Monarchy. Area, 3680 square miles; population at the census of 1923, 370,748, as compared with 396,200 in 1910. Carinthia, in 1923, had 5.67 per cent of the total population of Austria. Capital, Klagenfurt, with a population in 1923 of 27,423.

**CARLISLE, kâr-lil', ALEXANDER MONTGOMERY.** Irish statesman, shipbuilder, and engineer, died at London, March 5. He was born at Ballymena, County Antrim, Ireland, July 8, 1854, and was educated at the Royal Academical Institution at Belfast of which his father was head master. When 16 years of age he joined the Harland and Wolff shipbuilding works as an apprentice, and rose through successive positions to general manager and chairman of the managing directors from which position he retired in 1910. In 1906 he contested West Belfast as a Liberal, but received an insignificant vote, and in 1907 became an Irish Privy Councillor. On August 9, 1920 he stood on the steps of the throne, to which he had access as a Privy Councillor, after the motion for the second reading of the Restoration of Order in Ireland Bill, and dramatically uttered the words: "My lords, if you pass this Bill you may kill England, not Ireland." This breach of order was formally noted by the House of Lords and an opportunity to explain or apologize was given to Mr. Carlisle, but he felt unable to modify his position and accordingly the privilege of admission to the steps of the throne was withdrawn from him. He was one of the Merchant Shipping and Advisory Commission in making report to the Board of Trade on life saving appliances in 1911, and at various times advised the Admiralty on the organization of the Royal Corps of Constructors and other questions.

**CARNEGIE CORPORATION OF NEW YORK.** Founded by Andrew Carnegie, and chartered under the laws of the State of New York, June 9, 1911, this corporation was formed for the purpose of promoting "the advancement and diffusion of knowledge and understanding among the people of the United States." The original endowment was \$125,000,000, an amount to be somewhat increased upon the final settlement of Mr. Carnegie's estate. The income of this principal fund is applicable only within the territorial limits of the United States, but the Corporation holds also a special fund of \$10,000,000, of which the income is applicable in "Canada and the British colonies." The programme of the Corporation is chiefly concerned with library service, the place of the arts in American life, adult education, scientific research, and educational studies. Although the Carnegie Corporation is an educational foundation, it is not an operating agency, and its activities are limited to financial coöperation with existing institutions and associations.

The grants voted by the Corporation during the fiscal year 1925-26 amounted to \$6,016,500. There were 428 applications acted upon, 79 were granted, 4 were referred to other agencies, and 345 were declined. In addition, on the initiative of the Corporation, twenty allocations of college

arts teaching equipment were made and provision for twenty-seven arts scholarships was voted. The total amount of the grants was \$6,016,500, distributed as follows: library service, \$4,559,500; fine arts, \$637,000; education studies, research, and publications, \$372,000; adult education, \$342,000; miscellaneous, \$106,000.

The outstanding event of the year 1925-26 was the adoption of a ten year programme in library service, based upon a study of several years and looking forward to the following activities: the continued support and the ultimate endowment of certain existing library schools; the establishment, support, and ultimate endowment, to the extent of \$1,000,000, of a graduate library school of a new type at the University of Chicago; the completion of the fiftieth anniversary programme of the American Library Association and the eventual collection of an endowment fund of \$1,000,000 for the professional services of this association to the libraries of the country, and particularly to the smaller libraries in which Andrew Carnegie manifested during his lifetime so keen and generous an interest. Another event of primary importance was the formation of the American Association for Adult Education, (q.v.), which resulted from the basic studies and general survey made by the Carnegie Corporation in the field of education for adults.

In the field of Fine Arts, in which the Corporation had become interested, sixty-four colleges and universities were benefited by gifts of equipment or by grants for endowment, maintenance, or research, or by opportunities offered to individuals for further training. On the advice of the Fine Arts advisory group, 18 men and 9 women, from 16 different colleges, in all parts of the country, were selected to receive grants for graduate study ranging from \$1200 to \$2000. Twenty sets of teaching collections in the arts were brought together and offered to and accepted by colleges and universities. Each set of material consisted of about 1800 photographic reproductions of architecture, sculpture, and painting; two small collections of original material; a collection of books, about 1400 volumes in all; an annotated catalogue. It was hoped by this activity in the Fine Arts to counteract to some extent the shortage in adequately prepared teachers of art, and the inadequacy of teaching material.

The Corporation continued to support various scientific projects such as research in purification of insulin, investigation of high frequency rays of cosmic origin, coöperative research in pyorrhea and otosclerosis, and study of the susceptibility to infectious diseases. Various studies conducted by the Society for the Promotion of Engineering Education, the Modern Language Association, the Institute of Economics, and the American Law Institute were continued through the year.

The Trustees of the Corporation were: James Bertram, Nicholas Murray Butler, Louise M. Carnegie, John J. Carty, Samuel Harden Church, Robert A. Franks, William J. Holland, Frederick P. Keppel, Russell C. Leffingwell, John C. Merriam, John A. Poynton, Henry S. Pritchett, and Elihu Root. Officers of Administration: Elihu Root, chairman of the board; Robert A. Franks, vice-chairman and treasurer; Frederick P. Keppel, president; James Bertram, secretary; and Robert M. Lester, assistant to the president.

Headquarters were located at 522 Fifth Avenue, New York City.

**CARNEGIE INSTITUTE.** See ART EXHIBITIONS.

**CARNEGIE INSTITUTE OF TECHNOLOGY.** A non-sectarian institution for technical education at Schenley Park, Pittsburgh, Pa.; founded in 1900. The enrollment for the autumn of 1926 was 5653, including 2300 registered in the regular day courses, and 3353 in the evening courses. For the summer session 500 students were registered. The faculty numbered 299, of whom 231 were on full time, and 68 on part time. The endowment of the institution was \$15,382,752.29, and the annual income \$772,102.84. The institute has a campus branch of the Carnegie Library of Pittsburgh which has 450,000 volumes. President, Thomas Stockham Baker, Ph.D., LL.D.

**CARNEGIE INSTITUTION OF WASHINGTON.** An organization founded in 1902 to encourage broad and liberal investigation, research, and discovery, and the application of knowledge to the improvement of mankind. The results of its investigations are made known through the scientific journals, the institution's *Year Book*, a series of monographs which it issues, and other regularly established channels. During the year, the publication of 13 volumes in this series was authorized, at an estimated cost of \$54,300, and twelve additional volumes were in press in October, 1926. The *Year Book* includes statements relating to current advance of researches and reports of progress of the following established departments of research: embryology, genetics, geophysical laboratory, historical research, meridian astrometry, Mount Wilson Observatory, nutrition laboratory, laboratory for plant physiology, and terrestrial magnetism.

During the year the Department of Embryology made significant progress in the study of human embryology and in the transformation of the white blood cells, which were found to be concerned in the origin of certain types of malignant tumors. The research of the Department of Genetics made it increasingly clear that the endocrine glands are among the most important agents in the development of the individual. The Department of Nutrition made important researches in the relation of the thyroid glands to the metabolic processes. The Department of Terrestrial Magnetism made a type of attack which opened many new possibilities for interpretation of the whole group of phenomena toward which its activities are directed. The institution gave financial support to the work of Dr. Millikan of the California Institute of Technology on fundamental problems concerning the structure of matter.

Among the advances of the year at Mount Wilson were Dr. King's work on classification of spectral lines, the complete analysis of a complex spectrum by Henry Norris Russell, the measurements of ultra-violet solar radiation by Mr. Pettit, the refinement of measurement of the velocity of light by Dr. Michelson, the advance of knowledge of the universe of spiral nebulae by Dr. Hubble, and the study of changing conditions on the face of the sun made possible by the new spectrohelioscope designed by Dr. Hale. Earthquake investigation, in operation through various institutions on the Pacific Coast, under the direction and support of the Carnegie

Institution, entered a period of intensive study through utilization of new instruments, new stations, and the support of investigational effort from many fields of study concerned with the physics of the earth's crust.

The group of lectures upon outstanding attainment in research in the Carnegie Institution was continued through the year. The plan for protecting results of research in the interest of the public advanced to the stage of full application through licensing of approved agencies to produce appliances which have been patented. Patents were granted during the year on: an apparatus for measuring oxygen consumption in the study of metabolism, developed by F. G. Benedict, Director of the Nutrition Laboratory, and Mrs. Benedict; on improvements in seismometers invented by John A. Anderson, of the Mt. Wilson Observatory; on an apparatus for the measurement of variation in the force of gravity, developed by F. E. Wright of the Geophysical Laboratory; on improvements in micro-furnaces made by H. S. Roberts of the Geophysical Laboratory; and on a tree-growth measuring instrument completed by D. T. MacDougal, Director of the Laboratory for Plant Physiology.

Receipts for the year amounted to \$1,582,917.03, and expenditures to \$1,644,718.07. Property was valued at \$3,484,356.50. Officers for 1926 were: president, John C. Merriam; Board of Trustees: chairman, Elihu Root, vice-chairman, Charles D. Walcott, secretary, W. Cameron Forbes. Elihu Root was chairman of the Executive Committee, Henry S. Pritchett of the Finance Committee, and R. S. Brookings of the Auditing Committee. Directors of departments were: embryology, George L. Streeter; genetics, Charles B. Davenport; geophysical laboratory, Arthur L. Day; historical research, J. Franklin Jameson; meridian astrometry, Benjamin Boss; Mt. Wilson Observatory, Walter S. Adams, with George E. Hale as honorary director; nutrition laboratory, Francis G. Benedict; plant physiology, Daniel T. MacDougal; terrestrial magnetism, Louis A. Bauer.

**CAROLINE ISLANDS.** See GERMAN NEW GUINEA.

#### CASE SCHOOL OF APPLIED SCIENCE.

An engineering college at Cleveland, Ohio; founded in 1881. In the autumn of 1926 the enrollment was 563 students. The faculty numbered 62. The productive funds of the school amounted to \$3,500,000, and the income for the year to \$322,298. There were 24,000 volumes in the library. During the year gifts to the amount of \$1,670,000 were received. A new Mechanical Engineering Laboratory expected to cost, with equipment, about \$500,000, was begun. President, Charles Sumner Howe, Ph. D., D.Sc., LL.D.

**CASLIN, SIR MICHAEL PATRICK.** Prime Minister of Newfoundland in 1919, died at St. John's, N.F., August 30. He was born at Cape Broyle, N.F., September 29, 1864, and was educated at St. Bonaventure's College at St. John's. He engaged in business as a fishery merchant at Cape Broyle in 1885, continuing his career, though entering political life in 1893 at the time of the Colonial General Election. Being selected a member of the House of Assembly for Ferryland district, he served continuously from that time until 1923. He was originally a Liberal, remaining with that party until 1905, when he joined the Independent party in the Assembly, and in 1908 he united with Sir Edward Morris. From 1909-

19 he was Minister of Finance and Customs and in the latter year became Prime Minister, succeeding Sir William Lloyd. From 1920-23 he was the leader of the opposition. In 1910 he represented Newfoundland before the Imperial Royal Commission on West India trade at Jamaica, and in 1918 was acting Prime Minister, acting Minister of Militia, and acting Minister of Shipping. During the War, as Minister of Finance, he raised the first successful Victory Loan in the Colony and served as vice-chairman of the Newfoundland Patriotic Fund and of the War Finance Committee. In 1918 he was created K.C.B.E. (Knight Commander Order of the British Empire).

**CASSATT, MARY.** An American figure and portrait painter, died at Meunil-Theribus, Oise, near Paris, France, June 14. She was born at Pittsburgh, Pa., in 1845, and after a brief course at the Pennsylvania Academy of Fine Arts at Philadelphia, went to Europe in 1875 to take up her studies in the museums and galleries where the works of the great masters were hung. Her first picture, painted in 1872, representing two young women at a carnival throwing confetti, was accepted at the Salon as were other pictures until 1877, when the work submitted was refused. She then was invited by Degas to exhibit with a group of impressionists studying more or less informally with him, and allied herself with this school, making her permanent residence in Paris in 1879. She also came under the influence of Renoir.

Miss Cassatt devoted herself almost exclusively to women and children, particularly the mother and child in the home environment, and her children are represented with truth, originality, and a keenness of observation, but without prettiness. Her best known paintings are: "The Bath," "Breakfast in Bed," "Mother's Caress," "Children Playing with a Cat," "In the Garden," "At the Mirror," "Maternity," "Child Playing with a Dog," "Child's Toilet," and "In the Box." At the Chicago Exposition in 1893 she painted a mural decoration, "Modern Women," for the Woman's Building. Miss Cassatt's work was found in many American galleries including the Wiltach collection in Memorial Hall, Fairmount Park, Philadelphia, Pa.; "The Mother and Child" in the Metropolitan Museum of Art; and the Corcoran Art Gallery, Washington, D. C.; the Fine Arts in Boston, Mass.; and art museums in Chicago, Detroit and Providence. "The Young Mother," a pastel, was acquired by the French Government for the Luxembourg collection. Special exhibitions of Miss Cassatt's work were held in Paris, and in 1898 in New York, and in 1909 in New York and Boston. Well-known also are her tinted etchings of which the series of ten entitled "Maternity" achieved considerable reputation. In 1924 Miss Cassatt was threatened with total blindness.

#### CATHOLIC UNIVERSITY OF AMERICA.

An institution of higher education at Washington, D. C.; founded in 1887. It includes graduate schools of sciences, law, and philosophy. Affiliated with it are the Catholic Sisters College for the training of teachers, Trinity College for young women, and the houses of study of 20 religious orders. The enrollment for the autumn of 1926 was 868, distributed as follows: school of theol-

ogy, 55; school of canon law, 56; school of law, 24; school of philosophy, 431; school of letters, 60; school of sciences, 242. In the 1926 summer session there was an enrollment of 405, not including the summer school at San Francisco, California, under the auspices of the University, and in which approximately 300 students were registered. In the autumn of 1926 the faculty had 116 members, of whom 30 had the rank of professor, one promotion having been made from the rank of associate professor during the year. The productive funds amounted to \$2,903,499.48, and the income for the year to \$662,726.06. Among the important gifts of the year was an additional \$250,000 from John K. Mullen of Denver, toward the erection of the John K. Mullen Memorial Library, under construction during the year and expected to be completed by the fall of 1927, and an additional \$60,000 from the hierarchy of the United States for the erection of a home for ecclesiastical professors. The library contained 262,000 volumes. Rector, Rt. Rev. Thomas J. Shahan, S.T.D., J.U.L., LL.D., Titular Bishop of Germanicopolis.

**CATTLE.** See LIVESTOCK; VETERINARY MEDICINE.

**CATTLE TICK ERADICATION.** See VETERINARY MEDICINE.

**CAUCASUS,** *kā'kū-sūs*. A term applied to the indefinite region in southeastern Europe, comprising the isthmus which separates the Sea of Azov and the Black Sea from the Caspian Sea; formerly a government of the Russian Empire. It was divided into two districts of Trans-Caucasia and Cis-Caucasia, of which the former was divided among the three republics of Armenia, Georgia, and Azerbaijan (*qq.v.*). These afterwards separated and were respectively incorporated under the constitution of 1923, in the Union of Soviet Republics, and are now known as the Transcaucasian Federation of Soviet Republics.

**CAVALRY.** See MILITARY PROGRESS.

**CELEBRATIONS.** Those events in the United States during the year that come under this heading, for the most part have had to do with the War of the Revolution and were celebrated in the usual conventional method with music and addresses pertinent to the occasion. Among the more important of these celebrations were the following:

*March 25.* The 292d anniversary of the landing of the Catholic pilgrims sent by Cecilius Calvert, second Lord Baltimore, was celebrated under the auspices of the Calvert Associates in Baltimore, Md., New York City, Norwalk, Conn., and Chicago, Ill. The major celebration was held in Baltimore, where Sir Esme Howard and Governor Ritchie were the principal speakers, while in New York City David I. Walsh, Senator elect from Massachusetts, was the speaker. It was proposed to hold a Nation-wide celebration of this event in 1934.

*April 17.* The 100th anniversary of the granting of a charter to the Mohawk and Hudson Railroad, the first unit in the New York Central System, was celebrated by the unveiling of two bronze tablets, one in Albany, N. Y., and the other in Schenectady, N. Y. These tablets which were identical showed at the top a bas-relief of the "De Witt Clinton" and at the bottom a train of to-day. A feature of the celebration was a pageant of locomotives consisting of ten power units led by the diminutive De Witt Clinton

and its train of yellow stage-coach model cars. At the throttle of the Clinton, clad in garments that were the style a century ago, was one of the oldest engineers in the service and with him was the oldest passenger conductor. Gayly attired women wearing gowns of that era, and their escorts, occupied the tops and the interiors of the coaches. Behind this train, which first ran in 1831, were other locomotives, including the famous "999," which pulled the Empire State Express at 112½ miles an hour in 1893. The last unit in the pageant was the giant Mohawk locomotive, just out of the shops at Schenectady, weighing 181 tons.

*May 23.* The tercentenary of the purchase of Manhattan Island from the Indians by Peter Minuit for \$24 was celebrated in New York City by a pageant illustrative of that event. It was conducted under the auspices of the Greenwich Village Historical Society and most of the participants were descendants of Hollanders and American Indians. An exhibition to show the progress and history of New York City was held in the Grand Central Palace.

*June 12.* The sesqui-centennial of the adoption of George Mason's famous "Declaration of Rights" by the Fifth Revolutionary Convention of the Colony, which was held in the old "Capitol" Building May 6 to July 5, 1776 was celebrated on June 12 in Williamsburg, Va. The original copy of this fundamental instrument of government, generally known as the "Bill of Rights" was placed in the State library in 1844 by one of Mason's descendants and was exhibited. The exercises included a re-enactment in colonial costumes of the proceedings of the convention in the chamber of the House of Burgesses which culminated in the adoption of this famous document. This feature was quite realistic and accompanied with more or less color and pageantry. The chief speaker was Dean Roscoe Pound of the Harvard Law School.

*June 15.* A pageant was enacted at Valley Forge, Pa., showing the evacuation of the encampments there by the ragged heroes of the Continental Army. It was participated in by 56 ancient commands from the 13 original states dressed in the bright colored uniforms of Colonial days.

*June 27-29.* The 150th anniversary of the battle of Fort Moultrie was celebrated in Charleston, S. C., and a special feature of the event was a tribute to Sergeant Jasper, whose monument is on the Battery looking out toward Fort Moultrie.

*June 28.* The 150th anniversary of American independence was celebrated in New York City, with a parade and a visit to St. Ann's Episcopal Church at 140th Street, where the body of Lewis Morris, one of the signers of the Declaration of Independence, is buried.

*June 28-July 5.* In accordance with a Commission appointed for the purpose of observing the sesqui-centennial of the Declaration of Independence and the centenary of the death of Thomas Jefferson a meeting was held in the White House in Washington, D. C., on May 13, which was presided over by President Coolidge, and the following plan was adopted: Monday, June 28, to be known as "Patriots' Pledge of Faith" in honor of the 150th anniversary of the day the Declaration, drafted by and in the handwriting of Thomas Jefferson, was first presented to the Continental Congress. On

that day it was proposed to have a ceremonial throughout the country to be known as the "Echo of the Liberty Bell." At 11 minutes after 11 o'clock on the morning of that day a bell was to be rung by the President of the United States in Washington. At the same time each governor and mayor, in his respective State or city, to ring a bell, and the mayor of Philadelphia to ring the Liberty Bell. This to be the signal for the ringing of bells of schools and churches everywhere throughout the country as the echo of the Liberty Bell. This ceremony to be immediately followed by a salute to the American flag, and every man, woman, and child afforded the opportunity to pronounce the official patriot's pledge of faith. Tuesday, June 29, to be known as Universal Education day in honor of the great system of free education which Thomas Jefferson aided in establishing. Wednesday to be Founders' day, Thursday Greater America day, in honor of the Louisiana purchase by Jefferson; Friday to be Signers' day in honor of the signers of the Declaration, and Saturday to be Monticello day, in honor of the establishment of Monticello, the home of Jefferson, as a National memorial to the author of the Declaration of Independence and as a patriotic shrine for the children of the United States. Sunday, July 4, to be observed as Jefferson Centennial day in honor of the one hundredth anniversary of the death of Thomas Jefferson, and Monday, July 5, to be celebrated throughout the land as Sesqui-centennial Independence day, marking the one hundred and fiftieth birthday of our Nation.

*July 4-10.* The 300th anniversary of the founding of the city of Salem, Mass., was celebrated during the entire week. A parade of 11,000 persons was reviewed by Vice-President Dawes who was the speaker at the anniversary dinner held in the State Armory building. Troops from Camp Devens and sailors from the three warships in Salem harbor marched in the parade. A band concert and fireworks concluded the festivities.

*July 4-8.* Patriotic services were held in Schuylerville, N. Y., commemorating the surrender of Burgoyne's forces to the Continental Army. Although the 150th anniversary of the surrender does not occur until 1927, this preliminary event was given this year and consisted largely of a historic pageant—"The Surrender of Burgoyne." Father Isaac Jogues, the intrepid Jesuit missionary who was the first white man to see Lake George and Saratoga Lake, was impersonated; Bartel Vrooman, builder of the first fort along the Hudson, reappeared; the struggles of the early settlers, beset by hostile Indians, were depicted; and finally the battle and the surrender were recreated, almost within a stone's throw of the original scene.

*July 5.* The 100th anniversary of the birth of Stephen C. Foster, the most noted of America's folk song writers, was celebrated in Pittsburgh, Pa. The composer of "My Old Kentucky Home," "Old Black Joe" and other famous songs was born in Lawrenceville, a suburb of Pittsburgh, one hundred years ago on July 4, but owing to protests by the clergy against holding it on Sunday, the celebration was held a day later in Schenley Park. The Pittsburgh Symphony Orchestra, assisted by a chorus, played the better

known of Foster's melodies, which were also broadcast by radio.

*July 9.* The 150th anniversary of the birth of the State of New York was celebrated in White Plains, N. Y., by a pageant depicting scenes attendant upon the meeting on July 9, 1770, in the old courthouse in White Plains, when the provincial congress of the Colony of New York broke away from the British Crown, ratified the Declaration of Independence, and swore allegiance to the United States of America. The pageant was produced under the auspices of the University of the State of New York and the Westchester County Historical Society, in the armory, on the site of the old courthouse which was burned to keep it from falling into the hands of the British.

*August 1.* The 50th anniversary of the admission of Colorado (sometimes called the "Centennial State") as the 38th state to be admitted into the Union, was held in Denver. The chief speaker of the occasion was Vice-President Dawes.

*August 2.* A bronze tablet in honor of New York's signers of the Declaration of Independence: William Floyd, Philip Livingston, Francis Lewis, and Lewis Morris, was unveiled in the Capitol in Albany, N. Y. The tablet was presented by Mrs. Samuel J. Kramer, State Regent of the Daughters of the American Revolution, after Mrs. Charlotte A. Pitcher, State Chairman, had described the story of the signers' tablet. State Senator William T. Byrne accepted it on behalf of Governor Smith and the people of the State, after which an address was made by Alexander C. Frick, State Historian.

*August 18.* At Roanoke Island, Dare County, N. C., there was celebrated the 339th anniversary of the birth of Virginia Dare, the first white child born on American soil. Members of Congress from North Carolina and Virginia, representatives of the governors of the two States, Bishop Joseph B. Cheshire of North Carolina, and members of the Roanoke Colony Memorial Association were present and took part in the ceremonies which included the unveiling of a monument at Manteo, for which \$2500 was appropriated by Congress, and the delivery of an historical address by Sir Esme Howard, the British Ambassador.

*August 27.* The 150th anniversary of the battle of Long Island was celebrated by the unveiling of a tablet at the South Brooklyn Savings Institution marking the spot where General Washington stood and watched the battle. The chief event of the celebration was a parade through Prospect Park by the Kings County American Legion and their associates. On May 23, a bronze tablet was unveiled in Prospect Park, Brooklyn, in memory of the women who served their country "by moral support or material aid" during the Battle of Long Island. The tablet is on an oak tree, on a hill on which it is said General Sullivan was captured.

*August 29.* The 150th anniversary of American independence and the part played by the Lutherans in obtaining and preserving it were celebrated in Columbus, Ohio, by the delegates attending the 48th convention of the Lutheran joint synod of Ohio meeting there. Tribute was paid to Peter Muhlenberg of Pennsylvania, first Speaker of the House of Representatives, a communicant of the church, as well as to several signers of the Declaration of Independence.

*September 4-11.* A series of festivities celebrating the 150th anniversary of the conference in the Billopp House, in Tottenville, Staten Island, between Benjamin Franklin, John Adams, and Edward Rutledge, commissioners from the Continental Congress, and Admiral Lord Howe on September 11, 1776, when the proposal that the colonists abandon their fight against England was rejected and the American Commission upheld the Declaration of Independence that had been issued in Philadelphia. The exercises began with 150 relay runners leaving Borough Hall, St. George, on September 4 with messages of greeting from Governor Smith of New York, Mayor Walker of New York City, and Borough President Lynch of Richmond to Mayor Kendrick of Philadelphia. The celebration culminated on September 11 with the presentation of the Billopp House in Tottenville to New York City as a National shrine. This dedication was followed by an historical pageant, in which 400 persons took part, depicting the scenes of the conference.

*September 5.* The 150th anniversary of the opening session of the first State Constitutional Convention of New York was held in Fishkill, N. Y. Part of the exercises were in the home of William Verplanck, built in 1730, which was the headquarters of Baron von Steuben. There were also exercises in Trinity Church, Fishkill, where the Provincial Congress convened in 1776, and there was a song service by Daughters of the American Revolution in the Continental burial ground near Fishkill, where Colonial soldiers are buried.

*September 8-18.* The 130th anniversary of the adoption of the Constitution of the United States was celebrated throughout the country with appropriate exercises, generally under the auspices of various patriotic societies. In New York City on September 18, brief exercises were held on the steps of the Sub-Treasury Building under the direction of the Empire State Society of the Sons of the American Revolution at which an address was delivered on "The Constitution—Who Cares?" by J. M. Morse, after which a wreath was placed on the statue of George Washington.

*October 7.* The centenary of the opening of the Erie Canal, now the New York State Barge Canal, was celebrated in New York City by a river parade that included craft of all classes, among which were many of the ancient canal boats and tugs that plied the old Erie. It started from Dyckman Street and proceeded down the Hudson River to Staten Island, where was reproduced the scene that was witnessed a century ago on the deck of the old *Seneca Chief*, when Governor De Witt Clinton poured a bucket of Lake Erie water into the harbor, which act was termed "The Marriage of the Waters." The aquatic procession then proceeded to 23d Street and the East River, where the official party debarked. A dinner attended by 700 representative citizens was held during the evening at the Waldorf-Astoria. For the carrying out of the program a Commission was appointed of which George Clinton of Buffalo, N. Y., a grandson of DeWitt Clinton, was made chairman, and Alfred M. O'Neill of Albany, secretary. Local celebrations were also held at various places along the line of the Canal.

*October 9-10.* San Francisco, Calif., celebrated

the 150th anniversary of her settlement with a pageant that began with the arrival of a little band of padres, soldiers, and settlers in representation of a like band that came to the city's gray hills in 1776 from old Mexico. On the 10th a pontifical mass was celebrated in the old Mission of San Francisco Dolores in memory of those held 150 years ago for thanksgiving after the long months of struggle afoot and astride mules.

*October 16.* The 150th anniversary of the battle of Pell's Neck was celebrated on Prospect Hill, Pelham Manor, N. Y., at the Boston Post Road and Split Rock Road, the site of the battle. The exercises included a parade to the former battlefield and the presentation of a pageant in which were enacted scenes before and after the battle. Also a celebration of this event was held in Mount Vernon, N. Y., on the same day, at which a staff and flag were presented to the city and an historical address was delivered by Judge Isaac N. Mills.

*October 19.* The 145th anniversary of the surrender of the British army under Cornwallis to Washington was celebrated at Yorktown, Va. The exercises included the placing of a wreath on the Yorktown Monument by representatives of the Sons of the American Revolution, the Daughters of the American Revolution, and other patriotic organizations. The exercises were under the joint auspices of the Sons and Daughters of the American Revolution of Virginia and the principal address was by Congressman Bland of the first Virginia district.

*October 28.* The 150th anniversary of the Battle of White Plains was observed in White Plains, N. Y., with the United States Government, the State of New York, the Westchester County Historical Society and the Daughters of the American Revolution participating. In the afternoon ground was broken at Chatterton Hill for the first Federal marker for this Revolutionary battlefield. The annual meeting of the Historical Society was held early in the afternoon at which papers descriptive of the battle were read, while later a tableau and a playlet dealing with incidents of the Battle of White Plains were presented. A two-cent commemorative postage stamp was issued by the United States Government in honor of the event.

*November 10.* The 151st anniversary of the formation of the U. S. Marine Corps was celebrated by a "birthday party" held in the Penn. Athletic Club in Philadelphia at which Major-General John A. Lejeune, commandant of the corps, was the guest of honor.

*November 17, 18, and 19.* The tercentenary of the founding of the city of New York was conspicuously celebrated. The opening day was devoted to individual expositions by Broadway merchants. Electric light standards from 34th to 75th Streets were decorated with shields inscribed "Give a thought to Broadway." In Battery Park at noon under the joint auspices of the Broadway Association and the Battery Park Association, there was a parade of soldiers from Governors Island and sailors from the New York Navy Yard. A salute was fired and there was a flag raising. For Thursday it was planned that a group of airplanes should fly high above Times Square and drop a ton of flowers in the vicinity of this centre of the city's life. "Miss Broadway" was to have distributed roses thrown from the planes. Also ten thousand colored bal-

loons were to have been released from the top of a prominent building. These features were in part prevented by mist and threatened rain. On Friday, the third day of the celebration, a parade started from 74th Street and proceeded south along Broadway to a point near 34th Street. Each float represented some distinctive picture symbolic of a spirit of progress and dealt with the tercentenary year in the history of New York City. The Broadway Association float illustrated the growth of New York and of Broadway from a winding country lane. It showed Battery Park as it was in the early days with Castle Garden, now the Aquarium, as the first milepost. The scene was continued to Bowling Green and No. 1 Broadway, the site of the first fort.

**December 6.** The Americans in Paris celebrated with a banquet the 150th anniversary of the arrival of Benjamin Franklin in France as the envoy from the American Colonies, which had declared their independence from Great Britain on the previous July 4. Franklin's landing was also appropriately celebrated on December 4 at the little fishing port of Auray in Brittany.

**December 29.** The 150th anniversary of the battle of Trenton was celebrated in Trenton, N. J., under the auspices of the New Jersey Historical Society. A parade and public dinner to which the President of the United States and governors of the thirteen original States were invited, were among the features of the celebration.

**WASHINGTON BICENTENNIAL.** The bicentennial anniversary of the birth of George Washington was to occur in 1932 and as mentioned in the YEAR BOOK for 1925 (p. 130), it will be celebrated with adequate ceremonies, the preparation of which has been entrusted to a National Commission appointed by the President, of which Senator Simeon D. Pess of Ohio is the chairman. No definite plans had been determined upon up to the end of 1926 although the public had been invited to make suggestions. In accordance with the request former President Charles W. Eliot of Harvard wrote: "This celebration, however, should be solemn, not gay, and spiritual, not materialistic. It should appeal to thinking people, not to the careless or indifferent. Its aims should be to increase the number of Washington's disciples and followers in and for the struggles of the future." Since the formation of the Commission it had lost by death Senator Spencer of Missouri and Frank A. Munsey and there had been added to it Bernard M. Baruch of New York

and Prof. Albert Bushnell Hart of Massachusetts.

The 100th anniversary of the great congress convened by the Liberator, Simon Bolivar, in Panama, on June 22, 1826 was celebrated by a Pan-American Congress held in Panama during June 18-25, 1926. In addition to the usual receptions and entertainments, a Bolivarian University of Panama was inaugurated with formal ceremonies, and a monument designed by the Spanish sculptor Benlliure was accepted. It presents a heroic figure of Bolivar with a bas-relief on either side depicting scenes in the life of the great Liberator. Surmounting the monument is a condor, symbolic of the South American continent and freedom. A commemorative series of postage stamps in honor of the Congress was ordered by the government of Panama. The June issue of the *Bulletin* of the Pan American Union was a commemorative number in honor of "a glorious anniversary."

**CELTIC STUDIES.** See PHILOLOGY, MODERN.

**CEMENT.** In 1926 foreign cement was making its way in the American market, being landed at New Orleans, New York, New Haven, Boston, and other eastern seaboard cities, just as had been done previously in the Hawaiian Islands and on the Pacific Coast, so that it was competing with the American product. For 1926 the total of imported cement was estimated at about 4,000,000 barrels as compared with about 3,500,000 barrels in 1925, and about 1,000,000 three years previously. European cement manufacturers were increasing their export surplus and Belgium in particular, one of the largest importers of cement, had tripled its production. As a result of these large imports American cement manufacturers were asking for increased protection.

The U. S. Bureau of Mines stated that the production of Portland cement in the United States in 1926—164,057,000 barrels—was the largest quantity manufactured thus far in any year, exceeding that in 1924, the next highest year in production, by almost 10 per cent.

The total manufacturing capacity of all the active plants at the end of 1925 was 193,391,000 barrels, according to manufacturers' reports supplemented by a few estimates. This total included the annual capacity—about 5,800,000 barrels of finished Portland cement—of six new plants that had begun operating during the year. They are located as follows: one each in Georgia, Michigan, Texas, and Virginia, and two in Ohio.

The Cement Committee of the American Society for Testing Materials during the year 1926 recommended a new standard which was

PORTLAND CEMENT MANUFACTURING CAPACITY OF THE UNITED STATES, BY COMMERCIAL DISTRICTS, 1924 AND 1925—U. S. BUREAU OF MINES

District	Estimated capacity (barrels)		Percentage of capacity utilized	
	1924	1925 *	1924	1925 *
Eastern Pennsylvania, New Jersey, and Maryland . . . .	43,831,000	43,607,000	88.2	92.4
New York . . . . .	9,107,000	10,199,000	83.1	86.0
Ohio, Western Pennsylvania, and West Virginia . . . . .	16,289,000	18,994,000	88.0	82.0
Michigan . . . . .	11,501,000	15,301,000	80.5	71.5
Wisconsin, Illinois, Indiana, and Kentucky . . . . .	23,532,000	26,091,000	92.7	90.2
Virginia, Tennessee, Alabama, and Georgia . . . . .	12,889,000	15,746,000	88.5	85.8

\* Subject to revision.

then officially adopted by the Society and was accepted by most of the makers and users of cement. In these specifications a slightly higher tensile strength requirement for the mortar briquette as well as more precise details of testing were demanded. These new specifications brought about reforms in testing cement which were stated to be much needed, as there had been variations in methods of testing as well as in the quality of the material under test, and it was deemed desirable to have the testing placed on such a basis that users could place absolute dependence on the results specified. There were in progress during the year co-operative studies by the Portland Cement Association and the Bureau of Standards which aimed to study the real nature of Portland Cement, its properties and behavior under the varying conditions of use. It was realized that this work would require a number of years and should answer a number of important questions which experience of many years of use had emphasized rather than solved.

**CENSUS, UNITED STATES.** During the fiscal year 1925-26 the United States Bureau of the Census handled 12,700,000 reports from individuals, corporations, institutions, etc., according to the annual report of the Director, W. M. Steuart. These reports were concerned with the social, industrial, and business life of the country, including births, deaths, and marriages, agriculture, manufacturing, forestry, mining, irrigation, power, fisheries, water transportation, and State and city finances. Tabulations of these data were made available to the public in 4860 mimeographed and printed statements and bulletins.

In connection with the gathering of the vital statistics, the report draws attention to the fact that the United States is probably the only major power that does not have a complete registration of births and deaths, many of the States not having adequate laws on this subject. To remedy this the Bureau was making an effort to have satisfactory registration laws on the statute books of every State before the next

PORTLAND CEMENT PRODUCED AND SHIPPED IN THE UNITED STATES, 1925, BY STATES

Total ..	161,781	157,295

decennial census in 1930. (See VITAL STATISTICS.) In order to show the principal facts concerning the productive industries of the country the Bureau collects and publishes, each second year, statistics of employment, wages, production, and power for all manufactures, and of stocks, production, consumption sales, and various other facts concerning the leading key industries, annually or at more frequent intervals. During the year ended June 30, 1926, approximately 743,000 reports were received from the 282,954 establishments covered by these statistics. The report emphasized the importance of obtaining statistics on distribution, in connection with those on manufacture, and recommended that preliminary work be done as soon as possible to establish the best methods of taking such a census.

For the agricultural census of 1925 a total of \$3,730,000 was appropriated, and during the year there were 1122 persons engaged on this work and 57,000,000 cards were punched, making a total of 96,387,000 cards punched for the Census of Agriculture. Cotton reports received during the year numbered 240,000. The information they contained was collected by 775 local special agents from 18,260 ginneries and 8000 other establishments, including cotton mills, cotton storage establishments, and mills engaged in crushing cotton seed and manufacturing cottonseed products. Summaries showing the quantity of

cotton ginned were published 12 times during the ginning season.

During the year a census of religious bodies was in progress.

**CENTRAL AMERICA.** The term generally applied to the southern portion of the North American continent, lying to the north of the Panama Canal and south of Mexico, and consisting of the five states, Costa Rica, Guatemala, Honduras, Nicaragua, and Salvador. See the articles on these respective countries.

**CEYLON, se-lon'.** An island in the Indian Ocean off the southern extremity of Hindustan, belonging to Great Britain. Its extreme length from North to South, i.e., from Point Palmyra to Dondra Head, is 266 miles; its greatest width 140½ miles from Colombo on the west coast to Sangemankande on the east coast. Area, 25,332 square miles; population, at the census of 1921, 4,504,549, as compared with 4,106,350 in 1911; estimated at the end of 1925, 5,009,502. The registered movement of population in 1924 was as follows: Births, 178,866; deaths, 122,959; marriages, 27,117. The chief cities with their populations in 1921 are: Colombo, 244,163; Jaffna, 42,436; Galle, 39,073; and Kandy, 32,047. The number of vernacular schools in 1924 was: Government schools, 1080, attended by 110,818 boys and 48,932 girls; aided schools, 1811, attended by 128,027 boys and 82,678 girls; unaided schools, 1012, attended by 12,779 boys and 5225 girls; English and Anglo-vernacular schools, 388, attended by 50,299 boys and 14,807 girls.

In 1924 the areas under the principal crops were: Paddy, 750,000 acres; other grains, 102,000 acres; cacao, 33,000 acres; cinnamon, 25,000 acres; tea, 418,000 acres; coconuts, 900,000 acres; and rubber, 450,000 acres. Of the total area of the island, 16,212,400 acres, it is estimated that about 3,000,000 acres are under cultivation and about 742,000 acres, pasture land. The livestock in 1924 was reported at 2000 horses, 1,383,000 horned cattle, 59,000 sheep, 50,000 swine, and 158,000 goats. The chief mining interest is plumbago, 50 mines being in operation at the end of 1924 and the exports in that year being 213,000 hundredweight. Gold, thorium, and monazite exist to some extent but have scarcely justified exploitation on a commercial scale. Gem quarries abound throughout the island and among the precious stones found are moonstones, rubies, cat's-eyes, and sapphires. The native manufactures include weaving and the making of tortoise shell boxes, earthenware, lacquer work, jewelry, carving, etc. They are not of much commercial importance, however. The chief manufactures on a large scale pertain to agricultural products, including the extraction of coconut oil.

The revenue in 1923-24 was £6,824,208 and the expenditure, £6,713,048. Imports in 1924 amounted to £20,821,898 and exports to £25,701,161. The chief exports were tea, rubber, coconuts, cacao, and cinnamon; the chief imports, cotton manufactures, rice and paddy, and coal and coke. The shipping which entered and cleared in the same year was 18,508,000 tons, of which 11,553,000 tons were British. At the beginning of 1925 there were 742 miles of railroads in operation and several new extensions under construction. The administration, as embodied in an Order in Council of December, 1923, is in the hands of a governor, aided by an executive council of seven members and a legislative coun-

cil of 49 members (12 official and 37 unofficial). Of the unofficial members, 23 are elected to represent territorial divisions, two to represent the Europeans, two the Burgher Community, one the Chamber of Commerce, one the Western Province Tamils, three the Mohammedans, and two the Indians. Governor at the beginning of 1926, Sir Hugh Charles Clifford.

The Maldive Archipelago, consisting of 13 coral islets, 400 miles west of Ceylon, is tributary to Ceylon. They are sparsely settled by a mixed race of probably original Aryan stock and governed by a native Sultan. The islands are covered with coconut palms and yield millet, fruit, and coconut produce. Communication is mainly by native craft with Ceylon and the mainland. The population numbered over 70,000 at the 1921 census. The islanders are civilized and are great navigators and traders.

**CHAMBER MUSIC.** See MUSIC.

**CHAPIN, CHARLES FREDERIC.** American editor, died at Waterbury, Conn., October 27. He was born at South Hadley, Mass., Aug. 3, 1852, and graduated from Yale in 1877. In 1878 he became editor of the *Waterbury American* and in 1883 was made secretary of that publication as well as its editor.

**CHAPMAN, WILLIAM YOUNG.** American theologian and educator, died in Newark, N. J., October 27. He was born in New Brunswick, Canada, in 1859, and was educated at Mount Allison University in Canada and at Princeton University and Princeton Theological Seminary. After pastorates at Reading and Franklin, Pa., he went to Buffalo where he remained for four years, going in 1905 to Newark to become the pastor of the Roseville Presbyterian Church. In 1924, Dr. Chapman was made president of the Bloomfield Presbyterian Theological Seminary and in addition to his theological studies was greatly interested in the reformation movement in the old world, particularly in the Ukraine. A breakdown early in the summer of 1926 preceded his fatal illness.

**CHARITIES.** See CHILD LABOR; CHILD WELFARE; OLD AGE PENSIONS; RED CROSS; SOCIAL WORK; UNEMPLOYMENT; YOUNG MEN'S CHRISTIAN ASSOCIATION; YOUNG WOMEN'S CHRISTIAN ASSOCIATION and the various articles on religious bodies and societies with charitable activities.

**CHAUTAUQUA INSTITUTION.** An educational movement established in 1874 by Lewis Miller and Dr. John H. Vincent, both prominent in the Methodist Episcopal Church. The institution is non-sectarian in principle, though the original idea of the organization was a Sunday school for teachers, whose purpose was to conduct a summer school where a series of correlated lectures and entertainments were presented during the months of June, July, and August. The three general fields of activity are: the general assembly, consisting of an educational and popular series of lectures and addresses, concerts and dramatic entertainment, etc.; the summer schools, offering courses of formal classroom instruction; and a home reading circle in which a set of four books is designated for reading during the year, in addition to a news narrative appearing in a monthly review. In 1926 there were 18 departments in the summer school, with 125 instructors and 2500 students, while the attendance at the annual session was estimated at 45,000. Financial support is obtained largely through individual gifts. Permanent buildings,

valued at \$1,250,000, are owned by the Institution at Chautauqua, N. Y., where the general summer assemblies are held and the Chautauqua Press is located. Officers: George E. Vincent, honorary president; Arthur E. Bestor, president; William L. Ransom, chairman of trustees; Shailer Mathews, chairman of executive board; Charles E. Pierce, secretary; and Jessie M. Leslie, treasurer.

**CHEMISTRY.** The message brought to us in 1926 by the many students of, and workers in, chemistry was one of continual progress. No other branch of science seems to offer greater opportunities for either scientific or material advancement so that its attractiveness continued to be most alluring. Something of the development of the progress of this favorite science is shown in the paragraphs that follow.

**NEW ELEMENTS.** During 1925 there were numerous announcements of the discovery of new elements, and it seemed reasonably probable that the entire series would be completed in the near future. On March 8 a press dispatch was published announcing the discovery of one of the five unknown elements by B. S. Hopkins of the University of Illinois in Urbana, Ill. This discovery was made by placing a sample of the material in an X-ray tube in such a way that the X-rays when formed originate from the material to be examined. These rays fell between the places where the lines for No. 60 and No. 62 would appear and they must be those of the unknown element No. 61. In time the element will be isolated from the material containing it and its properties studied in detail. As this element was discovered in the United States the name "Americium" was proposed for it, but Professor Hopkins gave it the name of "Illinium" in honor of the State University where it was isolated. In May Dr. William Teg of Cornish, Me., announced his discovery of a new radioactive element which he calls brodium and reports it to be closely related to the alkali elements, such as potassium and sodium. On the other hand the elements numbered 75 and 43 in the periodic tables announced in 1925 by Walter Noddack and named by him rhenium and masurium have not been definitely accepted; for according to Science News (*Science*, Sept. 24, 1926, p. x) O. Zvjaginstsev repeated the experiments of Noddack using rare metals from the same source and has failed to find the element No. 75 at all and considers the presence of the still rarer element No. 43 "extremely unlikely." In addition therefore to Nos. 43 and 75 there still remain Nos. 61 (Illinium), 87 and 85 to be discovered. The announcement of brodium by Teg if corroborated would probably prove to be No. 85. A press dispatch of November 6 announced that Prof. Luigi Rolla of Florence, Italy, at a meeting of scientists in Bologna described his discovery of the unknown element No. 61.

**ATOMIC WEIGHTS.** The nature of atoms con-

tinues to be an interesting subject for investigation, especially when applied to the transmuting of elements. Although the changing of baser metals to gold seems for the time not to be accepted, nevertheless the changing of base lead under the influence of electric current in a quartz lamp into mercury and perhaps into thallium was announced by A. Smits and A. Karssen of the University of Amsterdam. Of considerable importance was the substantiation of Bohr's theory that light and X-ray radiation are emitted by atoms in the process of change from one activated state to another, announced in a press dispatch in February by Prof. Karl T. Compton of the Palmer Laboratory of Princeton University.

According to determinations made by G. P. Baxter and W. C. Cooper (*Journ. Phys. Chem.*, vol. 29, p. 1364) the atomic weight of germanium was found to be 72.60. The material used was germanium tetrachloride and 32 analyses of this salt gave the ratios  $\text{GeBr}_4 : 4 \text{ Ag}$  and  $\text{GeBr}_4 : 4 \text{ AgBr}$  from which the atomic weight was calculated with silver at 107.880 and bromine 79.916. Studies by G. P. Baxter and H. W. Starkweather on the density and atomic weight of helium show (*Proc. Nat. Acad. Sci.*, vol. 12, p. 20) that the average values for the densities at 0° and 380 and 760 mm. at sea level, latitude 45° are 0.08923 and 0.17846 respectively. Taking the density of oxygen at 0° and 760 mm. at sea level, latitude 45°, to be 1.42898, previously recorded erroneously as 1.42901, the atomic weight of helium is 4.000, uncertainty affecting the fourth decimal only.

From the laboratories of Harvard comes a study on the atomic weight of uranium lead and the age of an especially ancient uraninite by T. W. Richards and L. P. Hall. They report (*Journ. Amer. Chem. Soc.*, vol. 48, p. 74) that uranium lead from a specimen of the oldest Pre-Cambrian mineral yet found ( $1.5 \times 10^9$  years) has an atomic weight of 208.07. Correction for the thorium content of the mineral reduces this to 206.02 but it appears probable that the atomic weight of pure uranium lead is less than this. W. D. Haskins and S. B. Stone report (*Journ. Amer. Chem. Soc.*, vol. 48, p. 938) their finding the mean atomic weight of meteoric chlorine to be 35.458 and that of terrestrial to be 35.457. Terrestrial chlorine of non-marine origin has the same atomic weight as that obtained from the sea. These results support Haskins' theory that the relative abundance of isotopes is most largely conditioned by their relative stability. A determination of the atomic weight of silver made by H. L. Riley and H. B. Baker (*Journ. Chem. Soc.*, vol. for 1926, p. 2510) gave as mean of 6 experiments a mean value of  $107.864 \pm 0.0013$ .

**ANALYTICAL CHEMISTRY.** As the student proceeds with his work he naturally experiments with various agents to accomplish his purpose and this practice results in the discovery of improved methods or technique, as well as in new or modified forms of apparatus. Some of the advances made in this branch of chemistry are given below.

K. Sampson recommends (*Biochem. Zeit.*, vol. 164, p. 288) for the determination of phosphoric acid in small amounts of material the following procedure: After precipitation of protein with trichloroacetic acid, inorganic phosphate is determined in the filtrate and organic phosphate in the ashed precipitate, by the ammonium

phospho-molybdate method. According to W. W. Lepeschkin (*Biochem. Zeit.*, vol. 171, p. 126), living protoplasm is distinguished from dead by the chemical combination of the lipin with the protein constituents, the severing of which combination constitutes the death of the tissue. M. Wikul describes (*Zeit. Anorg. Chem.*, vol. 151, p. 338) a new method for the determination of potassium as follows: The potassium is precipitated from hot solution in presence of considerable amounts of sodium chloride by means of sodium cobaltinitrite, in the preparation of which tartaric acid has been substituted for the usual acetic acid. From the weight of the precipitate, which is a complex adsorption compound, the weight of potassium is obtained by multiplying by the empirical factor 0.1598.

A new micro-burner is recommended by R. Strebing (*Mikrochem.*, vol. 4, p. 14) which he describes as follows: The jet of the burner consists of two concentric tubes, the inner tube having a relatively thick wall, so that the orifice is small. By means of a cock, the gas stream can be directed through the central jet or through the annular space between the two tubes to give a small, circular flame. A second stopcock serves to regulate the volume of gas supplied to the burner. Concerning proline E. Abderhalden and H. Sichel (*Zeit. Physiol. Chem.*, vol. 152, p. 95) report that it may be esterified almost quantitatively by passing hydrogen chloride into its alcoholic solution and removing the solvent and catalyst in a vacuum. The hydrochloride of the ester is stable in a vacuum at 120° and is not decomposed by organic solvents. Even in aqueous solution it is not easily hydrolyzed. The free ester, on the other hand, is readily decomposed at the ordinary temperature by traces of water. It does not easily form polypeptides or anhydrides, but proline anhydride has been isolated in small yield.

According to A. Elek and H. Sobotka (*Journ. Amer. Chem. Soc.*, vol. 48, p. 501) the Kjeldahl method for the determination of nitrogen gives satisfactory results with nitro-compounds if dextrose be added to the reaction mixture in the proportion of 1 gram to 0.1 gram of the substance desired to be analyzed. Equally satisfactory results are obtained with dextrose when using Prezl's method of micro-analysis. With regard to the preparation of phenolphthalol and its reaction towards oxydases and peroxydases G. D. Buckner (*Amer. Journ. Physiol.*, vol. 74, p. 354) describes a new method for the preparation of phenolphthalol, which he finds to be a satisfactory reagent for oxydases and peroxydases but which, however, is not preferable to phenolphthalin. He finds that human blood can be detected at a dilution of 1 in  $5 \times 10^6$ .

It has been found by E. V. Howell (*Journ. Amer. Pharm. Assoc.*, vol. 14, p. 704) that by the use of silica gel instead of talc in aqueous solutions, only one third as much material is required and that filtration is more rapid. It is noted however that ethyl alcohol and silica gel produce an effervescence and a rise in temperature. According to Miss H. J. Ravenswaay (*Chem. Weekblad.*, vol. 23, p. 375) zinc acetate on ignition gives widely varying proportions of residue, and cannot be converted into oxide. When the substance is heated in a distilling flask the condensate collected below 100° contains zinc.

BIOCHEMISTRY. Great interest was being mani-

fested in the application of new compounds to therapeutic uses in medicine; not only in the great institutions where the prevention of disease is studied but also in State experiment stations where such remedies are considered in relation to lower animals.

Of interest is the isolation of a new substance from blood and its bearing on determination of uric acid by G. Hunter and B. A. Eagles. These authors find (*Journ. Biol. Chem.*, vol. 65, p. 623) that by treatment of the protein-free filtrate from red blood-corpuscles with alcoholic mercuric chloride, fractional precipitation of the solution obtained on recovery from this precipitate with lead acetate and sodium hydroxide, removal of the lead from the precipitate with sulphuric acid, and treatment of the resulting solution with mercuric sulphate, there was obtained, from 5.5 liters of corpuscles 0.7 gram of a substance,  $C_6H_7O_5N_3$ , darkening at 250° and with a melting point of 269°-270°. The substance is neutral, takes up the bromine and decolorizes alkaline permanganate, gives Weyl's reaction, and is resistant to acid hydrolysis, being unchanged by heating at 140° for four hours with 20 per cent sulphuric acid; with nitrous acid, it gives traces only of nitrogen; it is suggested that the compound is a simple pyrimidine nucleoside. The substance gives a blue color with the reagents used for the determination of uric acid, and its presence accounts for the discrepancies observed between determination by the method of Benedict and that of Folin and Wu.

It was pointed out by S. Schmidt (*Ann. Inst. Pasteur*, vol. 39, p. 875) that Martin's broth possesses many advantages over other broths employed for the production of diphtheria toxin. It is cheaply prepared and gives a large yield of toxin, which is constant in properties and has good antigenic power. Its clearness renders easy the reading of the end-period of an agglutination reaction. H. M. Fox describes (*Nature*, vol. 117, p. 49) a new porphyrin as follows: although the hematin of hemoglobin and that of chlorocruorin both contain iron, the former has a different porphyrin from the latter, the axes of the bands of the two porphyrins obtained by Nencki's method being respectively 593, 549 and 613, 533  $\mu$  in quite dilute (1:3) hydrochloric acid. When a modification of Laidlaw's procedure for the preparation of porphyrin was employed the porphyrin from chlorocruorin which is soluble in chloroform, gave bands situated considerably on the red side of those from oöporphyrin or porphyrin from hematin.

The values of beef, pork, and lamb as sources of vitamin-A were studied by R. Hoagland and G. G. Snyder (*Journ. Agric. Res.*, vol. 31, p. 201) who followed the growth of young rats receiving rations adequate in other respects, but with varying proportions of dried lean meat as the only source of vitamin-A. The energy values of the different rations were found to be practically the same. The samples of beef and pork tested were relatively poor in vitamin-A. When 50-95 per cent of the ration consisted of the beef, growth was almost normal but in no case was normal growth obtained with the pork. The samples of lamb differed considerably; some were rather poor in vitamin-A, whereas others were richer than any other samples of meat tested.

J. A. Northrup has investigated carbon dioxide production and the duration of life of

*Drosophila* cultures. He finds (*Journ. Gen. Physiol.*, vol. 9, p. 319) that since the total quantity of carbon dioxide produced during its lifetime by each individual is greater at 15° than at 26° or 30° and is much greater in the light than in the dark, the duration of life of *Drosophila* can not be determined by the time required to produce a limiting amount of carbon dioxide. From their investigations G. Fontes and A. Yovanovitch find that the exclusion of light decreases nitrogen metabolism nearly to the level attained during sleep. The decrease in nitrogen metabolism during sleep in light is less than the corresponding decrease in darkness. D. L. Thomson reports (*Biochem. Journ.*, vol. 20, p. 73) that he finds the wings of the butterfly *Melanargia galatia* to contain a yellow crystalline pigment with a melting point of 253°, having the properties of a flavone or flavonol. A. Chanutin finds (*Journ. Biol. Chem.*, vol. 67, p. 29) that the oral administration of creatine to man is followed by retention of large amounts of the substance: after sufficiently prolonged intake of creatine, however, a definite increase in the excretion of creatinine occurs. Ingestion of creatine exerts a slight sparing effect on the nitrogenous metabolism.

L. Hackspill, A. P. Rollet, and M. Nicloux (*Compt. Rend.*, vol. 182, p. 719) stated that argon and nitrogen are present in defibrinated blood in approximately the proportions predicted by Henry's law. No argon was detected in the blood clot after it had been dried in a vacuum. The presence of argon in the blood is therefore due to physico-chemical equilibrium with the atmosphere, and not to radioactive decomposition of potassium as suggested by Pictet, Scherrer, and Helfer. A study of the iron contents of meat by E. B. Forbes and R. W. Swift reports (*Journ. Biol. Chem.*, vol. 67, p. 517) that analyses of various kinds of meat yield results that showed that, of meats in common use, beef is the richest in its content of iron. D. T. Harris (*Biochem. Journ.*, vol. 20, p. 271) finds that the irradiation of blood with ultra-violet light causes it to give up oxygen at high oxygen tensions and take up oxygen at low tensions. At about 15 mm. tension of oxygen there is gaseous equilibrium, no net change occurring on passing from the dark into the light. The taking up of oxygen by blood in ultra-violet is, he contends, a property of the plasma.

Iodine as a biogenic element receives full attention at the hands of B. Bleyer (*Biochem. Zeit.*, vol. 170, p. 265), who publishes a number of tables that show the iodine contents of the foodstuffs of districts in which goitre is and is not prevalent both within and without Bavaria, and of the typical soils, rocks, and drinking waters of these districts. Of considerable interest is the study by R. Combes (*Compt. Rend.*, vol. 182, p. 984) who by his determination of the nitrogen in oak leaves, stems, and roots, in two-year old plants shows that the nitrogen migrates from the leaves during the autumnal fading and accumulates in the stems and roots, the total quantity in the plant remaining approximately constant.

M. Sternberg finds (*Biochem. Zeit.*, vol. 171, p. 217) that the bilirubin in urine is oxidized by carefully warming with hydrogen peroxide in the presence of phosphoric acid and 50 per cent alcohol. This is shown by the green color of biliverdin which develops and intensifies on

cooling. The blood catalase content in mountain and valley dwellers in Middle Asia has been studied by A. I. Alexeev, who finds (*Biochem. Zeit.*, vol. 173, p. 433) that these mountain dwellers have an average of 38 per cent more catalase to the unit volume of blood than valley dwellers. Blood catalase is at its maximum in the morning and reaches a minimum in the evening. An investigation of the pancreas of all species of animals made by G. Bertrand and M. Macheboeuf (*Compt. Rend.*, vol. 182, p. 1305) shows relatively large amounts of nickel and cobalt as compared with other organs. Insulin, it was found, contains a relatively much larger proportion of nickel and cobalt than the pancreas, namely some 0.045 mg. to 100 clinical units of insulin. These same authors find (*Compt. Rend.*, vol. 183, p. 5) that the influence of nickel and cobalt on the hypoglycemic effect of insulin in the dog is similar to that in the rabbit. H. von Euler and I. Lindstal, who studied the vitamins, report (*Arkiv. Kemi, Min. Geol.*, vol. 9, p. 1) that the saponification of cod liver oil in an atmosphere of hydrogen yields a residue having reducing properties and a high iodine number. An aldehyde is probably present, distillable at 0.03 to 0.05 mm. Among the distillation products of cod liver oil is a fraction with strong reducing properties and a low iodine number. C. S. Williamson and H. N. Ets report (*Amer. Journ. Physiol.*, vol. 77, p. 480) that they find the concentration of hemoglobin in the blood to fall steadily during the first fifty days of life and that then it rises again, reaching a maximum at about the 150th day, only thereafter to fall somewhat to a steady value. According to G. A. Hartwell (*Biochem. Journ.*, vol. 20, p. 751) the proteins of oatmeal are of good value as regards growth in rats. A diet of oatmeal, butter, and salt mixture however, is inadequate for gestation and lactation. The addition of food casein, gluten, gelatin, and egg-albumen to the oatmeal produces better growth in the suckling rat.

From the leaves of the New Zealand pepper plant *Wintera colorata* H. J. Finlay reports (*New Zealand Journ. Sci. Tech.*, vol. 8, p. 107) that he has extracted an essential oil of which the main constituent appears to be a limp colorless oil with a boiling point of 169°-170°, and also a pyrocatechol tannin which seems to differ from any yet recorded. His attempts to isolate the pungent principle were unsuccessful.

The isolation of insulin was effected by C. Funk (*Science*, vol. 63, p. 401) who reports that insulin purified by way of its compound with flavianic acid, gave analytical results corresponding with the formula  $C_{56}H_{102}O_{22}N_{14}S$  or  $C_{74}H_{114}O_{24}N_{20}S$ . The structure may be that of a polypeptide compound of about 15 amino-acids. J. J. Abel of the Johns Hopkins University is credited with the preparation of crystalline insulin. Also L. Pollak (*Arch. Exp. Parth. Pharm.*, vol. 116, p. 15) reports that the pancreas of human diabetics contains insulin but much less than the pancreas of normal individuals. A study on the ripening of tomatoes by J. F. Rosa (*Proc. Amer. Soc. Hort. Sci.* for 1925, p. 315) shows the hydrogen-ions of concentration and total acidity are maximal at the turning stage and minimal in the ripe fruit. Sugars, such as dextrose, and nitrogen increase from the green mature to the ripe condition; starch practically disappears in the earliest stages of ripening. The proportions of total soluble nitrogen and soluble solids in-

crease, the insoluble solids decreasing. Ethylene acts, it was found, as a stimulus to oxidative processes in fruit.

**GENERAL CHEMISTRY.** The trend towards mineral chemistry is shown by the forceful words of Edgar F. Smith who, at the jubilee meeting of the American Chemical Society in Philadelphia, said: "If the student of chemistry be desirous of engaging in the unraveling of profound chemical problems, he will find them in almost inexhaustible stores in that field." It might be added that there is a growing interest in that borderland between physics and chemistry called physical chemistry in which are to be found so many fascinating topics pertaining to the origin of matter.

**HELIUM.** Considerable advance was made in our knowledge of helium. In May a press dispatch claimed for C. F. Adams of Dayton, Ohio, that he had transmuted hydrogen gas into helium and other elements and that he had produced gold from mercury. Later came the announcement that the U. S. Bureau of Mines had carried out a series of experiments with animals in which a mixture of helium and oxygen was used for breathing purposes under pressure. The results with the animals seemed to indicate that this new mixture would be more suitable for deep-sea diving operations than the plain air now used, which contains a larger percentage of nitrogen.

In July a cable message brought the news that Prof. W. H. Keesom of Leyden University, Holland had succeeded in solidifying helium. With the help of very strong pumps a temperature of less than nine-tenths of a degree above absolute zero was obtained, but at this temperature the helium remained in a liquid state. On June 23, however, by subjecting the helium to a pressure of 150 atmospheres and a temperature of four and a quarter degrees absolute, the helium became fixed. A later experiment with one-half of a degree absolute and a pressure of 28 atmospheres was successful. The first experiment was accomplished in a steel tube and the second in a glass tube. According to O. Koblitz (*Chem. Listy*, vol. 19, p. 389) the average life period of ionium has been found to be 29,000 years. This age has been determined by a comparison of the intensity of a saturated current from the ionium of a sample of pitchblende containing 63-65 per cent of uranium with that of a saturated current from ionium-thorium oxide. The ratio of ionium to thorium in the saturated current is assumed to be 3:7.

An interesting study of the free path of slow protons in helium was made early in the year by G. P. Thomson. He finds (*Nature*, vol. 117, p. 235) that the scattering of protons in helium is maximal for rays of energy about 10,000 volts. The scattering of protons in hydrogen increases with decreasing energy of the rays, but less rapidly than if the scattering were due to forces of the inverse square type. C. H. Kunsman describes (*Science*, vol. 62, p. 29) a new source of positive ions. He finds that a previously fused mixture of iron oxide with 1 per cent of an oxide of an alkali or alkaline earth metal, with or without 1 per cent of aluminum oxide, when used as a hot anode, or employed as a coating for a platinum anode, gave after partial reduction steady positive ion currents up to  $10^{-4}$  amp./cm.<sup>2</sup> in a vacuum (10-mm.)

W. Fraenkel and A. Stern give (*Zeit. Anorg.*

*Chem.*, vol. 151, p. 105) their determinations of the crystallization temperature of alloys of gold and nickel on a continuous curve, having a minimum of 950° for alloys containing 15-20 per cent nickel. A continuous series of mixed crystals is thus formed and microscopical observation showed that 20 per cent and 40 per cent alloys are homogeneous, the former corresponding with the supposed eutectic mixture described by Levin in 1905 and by de Cesaris in 1914. According to C. G. Bedriag (*Ann. Sci. Univ. Jassy*, vol. 13, p. 346) the Volta effect is shown to be closely associated with the sub-grouping of the electrons in the outer shell of the atoms, but is also modified by the formation of molecules and by the surface layer, which is analogous to the layer causing ordinary surface tension, but it is only of the thickness of one atom or molecule. The work done by an electron in passing across this layer is a function of the constitution of the atom, and the Volta effect for two substances is the algebraic sum of the work of passage across the two layers in contact. The observed effect however, is complicated by the thermo-electrical, photo-electrical, and chemical effects which may coexist.

An interesting paper on the distribution of size of particles in disperse systems was published by A. Gyemont (*Zeit. Physik.*, vol. 36, p. 457). He deduces a formula for the size of the particles based on the assumption that stable systems result from the aggregation of smaller particles. This aggregation, he contends, is the result of collisions and reaches a limit, which is determined by the boundary potential, the electric charge, and the degree of hydration.

According to J. Vogel (*Monatsch.*, vol. 46, p. 265) rubidium and cesium show no tendency to replace one another in silver gold halides. On account of the great difference in solubility and crystal form of the rubidium and cesium triple chlorides, a method is proposed for the separation of these elements which is spectroscopically complete. This paper confirms the previous studies of Wells.

As to the possible synthesis of elements in the X-ray tube, F. H. Loring describes (*Chem. News*, vol. 132, p. 311) his experience as follows: An X-ray spectrum of potassium phosphate containing calcium and aluminum showed the presence of bromine. This may have been derived from the commercial potassium salt used in making the phosphate, and the author also suggests that it may have been produced from the potassium and calcium in the phosphate by four electrons entering the nucleus in the condensation of the two metals so as to reduce the atomic number to the correct value: (K)19 (Ca)20-4 = (Br)35. As a contribution to the interesting speculation as to the possibility of transforming mercury into gold, A. Gaschler (*Zeit. Elektrochem.*, vol. 32, p. 186) reports that mercury has been detected spectroscopically in a vacuum tube in which gold was bombarded with hydrogen nuclei in the form of positive rays. According to H. Bartels (*Zeit. Physik.*, vol. 37, p. 35) an atom can return in stages from the excited to the normal state. A relation is sought between the distribution of the energy of excitation over the single terms and the distribution of spectral intensities. Also the author develops a method which gives a survey of the complicated phenomena, particularly of the decrease of intensity along one series and the rela-

tion of the intensity in one series to that in another. Mlle. J. Inge and A. Walther presented their results (*Zeit. Physik.*, vol. 37, p. 292) of measurements of the voltage necessary to perforate microscopic objects and cover glasses at various temperatures up to 300°. From the temperature of liquid air up to about 50° there is no influence of temperature but above a critical temperature, different for different specimens, the variation of E. M. F., with temperature is in accord with the theory of heat. For rock salt the critical temperature lies between 220° and 250°.

It was found by L. F. Yntema (*Journ. Amer. Chem. Soc.*, vol. 48, p. 1598) that differences in physical properties such as color, must be due to different arrangements of the electrons in inner shells or levels; the presence of color in rare earth-elements is due to an incomplete kernel; in each instance where the kernel is complete the element has no absorption bands. A relationship between the absorption spectra is indicated which may be expected from analogy with X-ray and spark spectra. According to O. W. Richardson, who had made a series of investigations on the structure in the secondary hydrogen spectrum (*Proc. Roy. Soc.*, vol. 222, p. 714), a more detailed examination of the spectrum of the first type discharge, in which the strength in the red consists almost entirely of hydrogen and Fulcher's lines, has shown that there are a number of other lines which belong to the same system as Fulcher's bands. He therefore proposes a rearrangement of these lines.

G. Piccardi, an Italian student, reports (*Atti R. Accad. Lincei*, vol. 3, p. 489) that for the ionization potential of silver he finds values between 7.37 and 7.67 volts, the mean being 7.46 volts, which is in accord with the value 7.54 volts given by Foote and Mohler in their *Origin of Spectra*. He concludes therefore that Shentone's value of six volts must be erroneous.

An interesting study of the constitution of atoms scandium to nickel was published by R. Samuel and E. Markowicz (*Zeit. Physik.*, vol. 38, p. 22). These authors discuss the analogy between the valencies and paramagnetism of the ions and work out a scheme of subgrouping of the electrons. The 3<sub>s</sub> subgroup they subdivide into two groups. If all the 3<sub>s</sub> electrons were interchangeable there would be a greater similarity between the trivalent ions of one element and the bivalent ions of the preceding element, such as exists between beryllium and aluminum, lithium and magnesium, etc.

An important study of the band fluorescence of potassium and sodium was made by P. Pringsheim (*Zeit. Physik.*, vol. 38, p. 161). According to his account the metals were purified with great care, heated at 300° in a glass bulb, and illuminated with light from a powerful carbon arc. In addition to the red bands of potassium and the bluish green and orange bands of sodium, yellow bands were observed for a mixture of sodium and potassium which can also be obtained as absorption bands. These bands cannot be due to the presence of hydrogen or organic impurities and must be ascribed to molecules Na<sub>2</sub>, K<sub>2</sub>, and NaK. J. K. Syrkin finds (*Zeit. Anorg. Chem.*, vol. 155, p. 317) that the application of the quantum theory to the theory of the velocity of chemical reactions necessitates the assumption that the cross-section of the light quanta is proportional to the square of the

wave-length, which conflicts with the results of light absorption measurements. Also that the decomposition of sulphuryl chloride takes place at a higher speed than is accounted for by the radiation theory.

**MINERALOGICAL CHEMISTRY.** New minerals and their composition as well as the constituents of rocks with their relations to other chemical compounds, together with their behavior under chemical conditions, are included in this branch of chemistry.

In support of the view that when dolomite is calcined both calcium and magnesium oxides are formed simultaneously by dissociation, C. S. Garnett (*Min. Mag.*, vol. 21, p. 21) shows that mixtures of which calcium and magnesium carbonates and magnesium oxide may form part do not set unless there is also calcium oxide present, whilst the setting properties of partly burnt dolomite are well known. W. P. Eppler and H. Rose (*Chem. Zentr.* for 1926, p. 251) find that the hardness of the diamond is not the same in all directions, being least parallel to the cube faces, greater parallel to the rhombodecahedral faces, and greatest parallel to the tetrahedral faces. The faint colorations of simple substances such as sodium chloride and calcium fluoride are found by R. Klemm and G. O. Wild (*Chem. Zentr.* for 1926, p. 339) to be due to the decomposition of some of the constituent molecules into their atoms. This idea is in harmony with the fact that on heating the color gradually disappears. Colored minerals, such as feldspar, garnet, and tourmaline, owe their colors to the complexity of their molecules.

J. N. Friend (*Nature*, vol. 117, p. 789) describes his examination of water from the Dead Sea for eka-caesium and eka-iodine. Samples of Dead Sea water were collected during the summer at a depth of two feet which were found to contain small quantities of strontium salts. From the mother liquor after removal of non-alkali metals and fractional crystallization of sodium chloride, potassium chloroplatinate was precipitated, but neither this compound nor potassium chloride prepared from it gave any indication of the presence of eka-caesium when examined by X-ray analysis. Nor was the presence of eka-iodine indicated. C. Moureu and A. Lepape (*Compt. Rend.*, vol. 183, p. 171) describe the separation of the krypton and xenon in air and the amounts obtained by them. These rare elements are removed from the crude argon by fractional absorption with coconut charcoal and are then determined by the spectrophotometric method.

According to a press dispatch from Rome two new minerals containing silver, gold and platinum in a colloidal state have been discovered by Ludovico Dalferno who named them *dalfernite* and *aurogummite*. He describes dalfernite as a special variety of muscovite mica of crystalline or semi-crystalline form and micaceous structure. Aurogummite is a primary mineral, and is massive and compact, in an amorphous, glassy state. E. S. Larsen and E. T. Wherry announce a new mineral which they name *beidellite* from Beidell, Colo. where it was originally found. Its composition is given as Al<sub>2</sub>O<sub>3</sub>, 3SiO<sub>2</sub>, *n* H<sub>2</sub>O. *Swedenborgite* is a new mineral that crystallizes in the hexagonal system and according to an analysis by G. Aminoff has a composition corresponding to the formula Na<sub>2</sub>O, 2Al<sub>2</sub>O<sub>3</sub>, Sb<sub>2</sub>O<sub>3</sub>.

S. G. Gordon describes as new (*Proc. Acad.*

*Nat. Sci., Phila.*, vol. 77, p. 317) a lead gray mineral with metallic lustre and radiating columnar structure from Bolivia which he calls *penroseite* and which has a composition that is indicated by the formula  $PbSe, Cu_2Se (Ni.Co) Se_2$ . He also reports on an amber yellow mineral from Pintados, Chile, which he calls *trudellite*, and which has the composition of  $Al_2(SO_4)_3, 4AlCl_3, 4Al(OH)_3, 30 H_2O$ . Likewise, L. Zechmeister and V. Varabely describe (*Berichte*, vol. 59, p. 1426) under the name of *ajkaite* a new organic mineral found in Hungary, which appears to be a particular variety of fossil resin with a characteristic sulphur content of 1.5 per cent. It resembles but is certainly not identical with amber.

**ORGANIC CHEMISTRY.** This branch of chemistry is often called the chemistry of the carbon compounds, and in its domain research is often rewarded with brilliant discoveries, such as the aniline colors, or the synthetic dyes, as artificial alizarine or artificial indigo, or a synthetic remedy for disease, so that it continues to be most alluring to students. Some evidence of the progress in this favorite branch of chemistry follows:

The general properties of proteins were studied by M. L. Anson and A. E. Mirsky (*Journ. Gen. Physiol.*, vol. 9, p. 169) who conclude from theoretical reasons but with no new experimental evidence that: (1) hemoglobin, when denatured, is probably depolymerised to hemochromogen, and that in other proteins denaturation probably consists in depolymerisation, native proteins, therefore, being considered as aggregates of denatured proteins; (2) the globins and histones are to be regarded as denatured proteins rather than as a distinct class; (3) a non-polar group is uncovered when a protein is denatured; and (4) proteins are highly specific only in the native form. These authors further discuss in this paper the factors affecting the equilibrium between native and denatured protein. The results of an important study of an X-ray investigation of fibroin by R. Brill indicate (*Annalen*, vol. 446, p. 307) that an analogy seems to exist between the supposed structure of the unit silk crystal and that of the diketomethylpiperazine compounds obtained by Bergmann, Miekeley, and Kann.

A study involving the determination of unsaturated in presence of saturated and tricyclic hydrocarbons made by S. Nametkin and L. Brussoff shows (*Journ. Prakt. Chem.*, vol. 112, p. 169) that in order readily to distinguish unsaturated hydrocarbons from possible cyclic hydrocarbons formed by the dehydration of alcohols, some method of determining the former is desirable. Experiments with pure and mixed hydrocarbons show that the unsaturated hydrocarbons can be determined in the presence of saturated and cyclic hydrocarbons by the action of perbenzoic acid in chloroform solution. Excess of the oxidizing reagent is used and the excess determined iodometrically. By this suggested method accurate determination is possible with small amounts (0.1-0.3 grams) of hydrocarbon. The proposed method simplifies the study of the dehydration of alcohols.

R. J. Williams and P. A. Lasselle report (*Journ. Amer. Chem. Soc.*, vol. 48, p. 536) that creatine darkens when heated so that the temperature rises about  $10^\circ$  a minute, and then finally decomposes with effervescence at about  $291^\circ$ . Its identification is assisted by its quantitative loss of water of crystallization (12.082 per

cent) at  $100^\circ$ , and by its conversion into creatinine, the latter being identified by the melting point of the picrate and by the Jaffe reaction.

The mechanical liquefaction of starch is the subject of a study by R. Petit and Richard (*Compt. Rend.*, vol. 182, p. 657), who find that when starch paste is passed six times in the form of a spray into carbon dioxide or hydrogen, a soluble starch,  $[M]D_{210}^{20}$ , is obtained but when kept under sterile conditions the solution becomes progressively more cloudy. When centrifuged, a limpid, soluble starch solution is obtained, together with a deposit containing starch granules and cellulose. When heated with amylase at  $20^\circ$ , starch gives 0.91 per cent of an insoluble material which yields soluble starch on treatment with warm water, 61.4 per cent of dextrose when boiled with dilute hydrochloric acid, 100.5 per cent of dextrose when hydrolyzed with dilute hydrochloric acid and after previous boiling, and 73.9 per cent of maltose. When treated with amylase at  $50^\circ$  after previous boiling, some cellulose is found after the previous boiling treatment. Starch after treatment with light petroleum readily gives soluble starch.

It is reported by O. Dafert and Z. A. Melinaki (*Ber.*, vol. 59, p. 788) that when solutions of arsenic trichloride and pyridine in light petroleum are mixed, the very hygroscopic compound,  $AsCl_3, C_5H_5N$ , with a melting point of  $145.5^\circ$ , separates. In this connection these authors also describe the substances  $AsBr_3, 2C_5H_5N$  and a melting point of  $195^\circ$  and  $AsI_3, 3C_5H_5N$ . According to O. Achmatowicz (*Rocz. Chem.*, vol. 6, p. 59) hydrogen chloride combines with nopinene to produce bornyl chloride and terpinyl or terpene chloride. This may be explained on the basis of Starrinski's theory of the analogy between conjugated double linkings and rings whilst Wagner's theory does not afford a satisfactory explanation. It has been found by A. Zimmermann (*Compt. Rend.*, vol. 182, p. 1082) that larger crystals of herapathite (quinine sulphatoperiodide) than those hitherto obtained may be prepared by the action of iodine vapor on a solution of quinine sulphate in the presence of caffeine or quinol. In using two of these crystals as polarizer and analyzer respectively, the color in the position of extinction is sometimes olive green and sometimes bright red.

C. F. Ahmann and N. D. Hooker have investigated the constitution of pectin. Their studies published by the Missouri Agriculture Experiment Station show that titration of pectic acid indicates 11 carboxyl groups, but more are probably present. The nucleus proposed for pectic acid is a dibasic acid, galacturonic-galactonic acid; at least six such nuclei are associated. The hydrolytic decomposition of pectin by cold concentrated hydrochloric acid has also been studied and the results are given by these authors. According to H. B. Vickery and C. S. Leavenworth (*Journ. Biol. Chem.*, vol. 68, p. 225) the separation of histidine and arginine is not accomplished by treating a solution containing these two compounds with silver nitrate and then with barium hydroxide until faintly alkaline to phenolphthalein, precipitates all the histidine and a considerable amount of arginine. In this these authors disagree with the work of Kossel and Edlbacher who found that histidine alone is precipitated under these conditions.

A study on the organic chromium salts was published by E. Ageno-Valla and B.

Raposo who report (*Boll. Uff. Staz. Sperim. Ind. Pelli*, vol. 4, p. 75) with descriptions of various chromium formates especially those of definite composition, such as the normal chromic formate,  $\text{Cr}(\text{CO}_2\text{H})_3$ ;  $\text{Cr}_2(\text{OH})_4(\text{CO}_2\text{H})_2$ ,  $15\text{H}_2\text{O}$ ;  $\text{Cr}_2(\text{OH})_4(\text{CO}_2\text{H})_2$ ,  $7.5\text{H}_2\text{O}$ ;  $\text{Cr}(\text{OH})_2$ ,  $\text{CO}_2\text{H}$ ,  $6\text{H}_2\text{O}$ . The normal formate and to a greater extent the basic formates have tanning properties. The treatment of chromic hydroxide with lactic acid failed to yield definite salts. R. Delaplace (*Compt. Rend.*, vol. 183, p. 69) describes the preparation of cesium metal from the chloride and its conversion into the hydroxide. He then obtains cesium eosinate in crystalline form by evaporating a solution of the hydroxide to which an excess of eosin (as free acid) has been added and the excess removed by filtration.

According to H. LeB. Gray (*Ind. Eng. Chem.*, vol. 18, p. 811) chemical evidence indicates that in the cellulose molecule one hydroxyl group per  $\text{C}_6\text{H}_{10}\text{O}_5$  is different from the other eleven, and to account for this a formula for cellulose consisting of four dextrose residues, three of which contain the amylenoxide ring and the fourth the butylene oxide ring is proposed. This suggested formula is in agreement with known data concerning the degradation products of cellulose. J. C. Andrews (*Journ. Biol. Chem.*, vol. 69, p. 209) finds that the most complete reduction of cystine to cysteine was obtained by the use of tin and hydrochloric acid in large excess or by electrolytic reduction. In the latter case racemisation occurred unless the solution was well cooled. Starting with *l* cystine having  $[\alpha]_D^{20} -215.5^\circ$ , preparations of cysteine were obtained with  $[\alpha]_D^{20} -9.7^\circ$ .

**CHEMISTRY, INDUSTRIAL.** A greater recognition of the possibilities of industrial chemistry is substantiated by the progress indicated in that which follows in this brief summary, and also in the general acceptance of the suggestions made by leading chemists before the Institute of Politics held in Williamstown, Mass., such as "forget your worries and trust to chemistry," and "the real function of the chemist is to free man from the tyranny of specific raw materials."

**ORGANIZATIONS.** The spring meeting of the American Chemical Society was held in Tulsa, Okla., April 5-8. Symposia on Lubricants and on Orientation and Segregation as applied in Chemical Education, and a public address by A. D. Little on "The Romance of Carbon" were conspicuous features of the meeting. There was a registration of 431 names. The golden jubilee meeting,<sup>1</sup> celebrating the 50th anniversary of the founding of the Society, was held in Philadelphia, the week of September 6-10. On September 5 a pilgrimage was made to Northumberland, Pa., the home of Joseph Priestley, where in 1874 the centennial of the birth of chemistry was celebrated by a gathering of chemists, at which the first suggestion of the founding of an American Chemical Society was made. At Northumberland the chemists inspected the house built by Priestley in 1796, dedicated the new Priestley Museum which contains the laboratory apparatus and books used by the founder of modern

chemistry, and participated in a meeting on the lawn of the home, under tall pine trees planted by Priestley. Prof. Gerold L. Wendt presided at the memorial meeting, and S. A. Goldschmidt and A. A. Breneman of New York, surviving members of the group of chemists who attended the historic meeting at Priestley's grave in 1874, spoke on The Birth of the American Chemical Society at the Priestley House at that time. The Philadelphia gathering was marked not only by the large number (2249 persons registered) of chemists both from the United States and abroad but also by the large number of papers which were read and discussed. An unusual spirit of optimism as to future possibilities in chemistry prevailed and predictions as to the solution of such problems as a cheap motor fuel, artificial rubber, and new synthetic remedies for disease were made.

The Priestley Medal for outstanding achievement in chemical science was awarded to Dr. Edgar Fahs Smith, Provost Emeritus of the University of Pennsylvania, who delivered a lecture on "Joseph Priestley." Public addresses on "The Development of Chemical Industry in Italy" by Prince Genori Conti; "The Dyestuff Industry, Forerunner of What?" by Irénée du Pont; "La Chimie Moderne and Marcelin Berthollet" by Paul Sabatier; "Flames of Atomic Hydrogen" by Irving Langmuir; "Chemical Reactions of Atomic Hydrogen" by Hugh S. Taylor; and "Caricature in Science," by Ernst Cohen, were delivered. The nominations for honorary membership made at the Tulsa meeting were confirmed and included among the American members were Prof. Ira Remsen, Prof. Theodore W. Richards, and Dr. Edgar F. Smith. Four foreign chemists who came as delegates to the golden jubilee meeting of the American Chemical Society received honorary degrees of Doctor of Science from the University of Pennsylvania. They were Ernst Cohen of Holland, Prince Genori Conti of Italy, Sir James C. Irvine of Scotland, and Paul Sabatier of France. A special feature was the Pageant of Chemical Progress, which emphasized progress in American industrial history by a series of historical, technical, and commercial exhibits at the University of Pennsylvania gymnasium. The President during the year was James F. Norris, who delivered his annual address on "A Look Ahead."

The 45th annual general meeting of the Society of Chemical Industry was held in the Hotel Great Central, London, England, from July 19 to 23. During the year 367 new members were elected and the membership was reported as 4802 as compared with 4831 in 1925, a loss of 29. The treasurer reported a deficit of £1274. The feature of the meeting was the presentation of the Messel medal to the Earl of Balfour and his delivery of the Messel Memorial Lecture. Mr. W. J. U. Woolcock who had held the presidency of the Society for two years was succeeded by Francis H. Carr, and Edinburgh was chosen as the place of meeting for 1927. This year the meetings of the Society of Chemical Industry were held in coöperation with the following additional organizations: London Chemical Society, Institute of Chemistry, Association of British Chemical Manufacturers, British Association of Chemists, British Chemical Plant Manufacturers' Association, Bio-Chemical Society, Coke Oven Managers' Association, In-

<sup>1</sup> An admirable summary of the proceedings of the meeting with the title of "Golden Jubilee Number" constitutes a special issue (*Aug. 20, 1926*) of the *Journal of the American Chemical Society* (254 pp.).

stitute of Brewing, Institute of Metals, Institution of the Rubber Industry, Institution of Chemical Engineers, Institution of Petroleum Technologists, Oil and Color Chemists' Association, Society of Leather Trades Chemists, Society of Public Analysts, and the Chemical Industry Club, thus constituting a Congress of Chemists.

The annual meeting of the London Chemical Society was held in Manchester, England, on March 25, when the secretary reported a membership of 4083 as compared with 3963 in 1924. The treasurer's report was also favorable and showed a balance of £406. The address of the retiring president, Prof. W. P. Wynne, was on "The Coöperation of Science and Industry." Professor Wynne was succeeded by Prof. H. Brereton Baker.

The seventh annual gathering of the International Union of Pure and Applied Chemistry was held in Washington, D. C., during September 13-15. Delegates from Belgium, Canada, Chile, Denmark, Esthonia, France, Great Britain, Italy, Japan, Netherlands, Poland, Roumania, Spain, Switzerland, and the United States were present, making it one of the best attended gatherings ever held. The sessions at which papers of technical interest were presented, were presided over by Ernst Cohen of Netherlands. Conferences were held by smaller groups at which such topics as the reducing of chemical terminology to a common basis so as to make sure that similar products were given the same analysis were discussed; also the creation of an international commission to establish common methods of analysis for all products included as liquid fuels, such as gasoline, kerosene, benzine, and fuel oils was considered. It was agreed that the International Union should endeavor to devise a plan whereby scientific men who make discoveries and inventions and who usually do not patent such discoveries and inventions shall get some monetary reward when their work is developed into a commercial paying proposition. It was also recommended that foreign countries shall adopt that section of the patent laws of the United States, which provides that when a scientific discovery is made public, either orally or in writing, the author shall be allowed two years' time in which to make application for patent. Warsaw, Poland, was selected as the meeting place next year. In addition to numerous entertainments, Prince Genori Conti delivered a public lecture on "A Geophysical Study of the Soffioni District in Tuscany." At the close of the meeting the delegates were entertained by an excursion to large industrial centres including Wilmington, Del., Pittsburgh, Pa., Detroit, Mich., Niagara Falls, Rochester, and Schenectady, N. Y.

**WILLIAMSTOWN INSTITUTE OF POLITICS.** At the sixth annual session of this Institute (see **POLITICS, INSTITUTE OF**) held during August, the rôle of chemistry in the world's future affairs was presented in a series of papers among which were "Chemistry and World Affairs," by Dr. Harrison E. Howe, editor of *Industrial and Engineering Chemistry*, "Chemistry in World's Progress," by Sir James C. Irvine, Principal and Chancellor of St. Andrews University, Scotland, "Nutrition and Health," by Prof. H. C. Sherman of Columbia University, and "Future Chemotherapy," by Prof. A. S. Loevenhart of the University of Wisconsin.

**MEDALS.** In addition to the presentation of the Priestley medal of the American Chemical Society, the greatest of possible honors to an American chemist, given on September 7 to Dr. Edgar F. Smith of the University of Pennsylvania, the following award of medals may be mentioned: The Grasselli medal presented annually by the American Section of the Society of Chemical Industry for the paper delivered before that section that offers the most useful suggestion in applied chemistry, was given on Dec. 4, 1925, to Edward Robie Berry of the General Electric Company, Lynn, Mass. On Jan. 15, 1926, the Perkin medal of the American section of the Society of Chemical Industry was conferred on Richard B. Moore, formerly of the U. S. Bureau of Mines, for his contributions to industrial chemistry, especially those pertaining to the development of helium. Three large plants in Texas for the production of this valuable gas were under his care. On March 5, there was awarded to Samuel Coville Lind, associate director of the Fixed Nitrogen Research Laboratory, the William H. Nichols medal of the American Chemical Society given "for the research published during the current year which is most original and stimulative." Dr. Lind invented the interchangeable electroscope for radium measurements and originated the ionization theory of the chemical effects of radium rays. On April 28 the Chandler medal was conferred on Samuel Wilson Parr, professor of Applied Chemistry at the University of Illinois, "in recognition of his distinguished achievements in chemical science." The subject of his address on the occasion of the presentation was on "The Constitution of Coal." The Messel medal of the Society of Chemical Industry was on July 19 conferred on the Earl of Balfour who made the memorial address. On October 28, the Grasselli medal of the American Section of the Society of Chemical Industry was awarded to Charles Raymond Downs for his studies as indicated by his paper presented on that occasion on "Some Speculations in Catalytic Oxidation Reactions."

**ACTION OF UNITED STATES ON GERMAN PATENTS.** In 1922 the sale of certain German chemical patents to the Chemical Foundation, ordered under the administration of President Wilson while A. Mitchell Palmer was Alien Property Custodian, was attacked. President Harding directed that suit be filed for cancellation of the transaction, asserting that the price obtained was inadequate, that the sale was made without authority, and for other reasons. Since that time the matter had been in the courts until October 11, when the Supreme Court sustained the sale of seized German chemical and dye patents, trademarks, and copyrights, to the Chemical Foundation by the Alien Property Custodian. This decision wrote the final chapter of one of the largest and most spectacular of the Government's post-war recovery suits. The highest court upheld the adverse decision rendered after trial in the district court at Wilmington, Del. The previous history of the suit is to be found in earlier **YEAR BOOKS** (1922, p. 137; 1923, p. 139; 1924, p. 144; and 1925, p. 143) which should be consulted for detailed information.

**BERYLLIUM.** From Cleveland in January came the announcement that beryllium, a metal with remarkable properties, had been made available to industry after nine years of experimenting.

Formerly costing \$5000 a pound, it can be produced now at \$200 a pound. Alloyed, beryllium furnishes an entire series of new materials for metal manufacturing. It weighs 30 per cent less than aluminum, and while aluminum melts at 660°C., beryllium stands up under 1278°, a little less than the point at which steel melts. Airship construction is an obvious use for so light a metal, and had it been discovered ten years ago, alloys probably would have been developed strong enough to have prevented the Shenandoah disaster. The possibilities of this metal lie in its use with aluminum and magnesium, but unlike these, which corrode easily, beryllium is not affected by cold or boiling water or by steam at maximum heat.

**GOLD.** Concerning the production of gold from inferior metals referred to in the YEAR BOOK for 1925 (p. 144) it was the opinion of Dr. Haber that some one had allowed his gold-rimmed glasses to touch the mercury with which Professor Miethe performed his experiments of changing the atomic weight of mercury to produce gold. Dr. Haber believed there was a trace of gold in the mercury or that it came in contact with gold before or during the electrical charges and that the theory of being able to change the atoms as advanced by Professor Miethe was totally incorrect. Professor Miethe's later experiments, performed in the Kaiser Wilhelm Institute, which is the official research organization, had not produced the slightest trace of gold.

**IRON.** A process for the manufacture of electrolytic iron from discarded tin cans and automobile bodies, as well as other forms of iron which go to waste has been successfully introduced at Niagara Falls. The method consists in using bars of cast iron as anodes of huge wet batteries, the liquid being a solution of iron chloride. The cathode, the other terminal of the battery, consists of a bar of steel, and when the current is passed through, the iron dissolves from the cast-iron bar into the liquid, and at the same time is deposited from the solution on the steel bar. The iron thus deposited forms a cylinder up to a quarter of an inch thick. The metal on the inside next to the steel, which is deposited first, contains hydrogen, which makes the iron brittle, but this gas is removed by passing the cylinder through an oil-heated furnace. A stripping machine is used which enlarges the diameter of the iron tube, so that it may be slipped off the steel cathode, which may be used over and over again. The tubes may be used as they come from the machine for some purposes, or they may be flattened or slit and made into plates from which other iron objects may be made. Since only iron is deposited by this process, it is suggested that waste iron from dump heaps might be reclaimed by dissolving it in the iron chloride solution and recovering it electrolytically.

From Pittsburgh came the announcement in August of a new steel product—steel with a great wear-resistance surface, but a soft core, which was described as "a combination of steel elements never before obtained." The product, named "Jalcase," will reduce production costs and increase output of parts for automobiles, washing machines, other household appliances, typewriters and adding machines, shoe and textile machines and equipment where steel of great wear resistance is required for moving parts.

Heretofore, steel used in moving parts was hard throughout. Jalcase, with its hard surface and soft core, possesses a triple combination of fast machining, case hardening, and forging properties.

**LITHIUM.** In March an announcement was made of the discovery of lithia-bearing minerals northeast of Pointe du Bois, south of the Winnipeg River in Manitoba, forming an important addition to the deposit in Quebec, both of which constitute the only known lithium resources in the British Empire that are accessible to transportation and available for development. These ores consist of the minerals petalite, lepidolite, spodumene, and amblygonite. Numerous assays for lithia from sample minerals have been made and spodumene and lepidolite gave results of from 2 to 4 per cent. Tantalite, a rare mineral, has been discovered in the spodumene, giving this deposit an added interest. This is only the second discovery of this rare ore in Canada and it is rarely found in the United States. Lithium ore is shipped from California through the Panama Canal to the Atlantic Seaboard, and usually is sent to Europe to be treated, the lithium being returned in tablet form. Market prices for lithium oxide vary little, New York quotations late in the year being \$2.14. Lithium is largely used in the dyeing industry, medicine, photography, fire-works, etc., and the greatest demand is from Europe.

**POTASSIUM.** The development of potash deposits continues to be exploited in the United States. According to a report issued in May by the U. S. Geological Survey, promising sources of potash in the salt beds of Western Texas and Southeastern New Mexico have been discovered that may check the domination of the potash market in the United States by foreign producers. These beds are likely to be thick and extensive, suggesting large potash salt deposits, and while the samples obtained have not shown conclusively whether the potash is present in commercial quantity, indications point in that direction. The discovery was made through the drilling for oil in these regions where the cuttings have revealed potash salts such as are found in Germany and France.

H. M. Payne in a paper read before the American Mining Congress held in Cincinnati, Ohio, on May 24, said that the potash deposits of Texas look like white sand and are from 500 to 1500 feet deep. Government aid will be required in launching the new industry, and a bill was introduced in Congress to appropriate money to drill and prove fields. Later, an investigation of the possibilities of developing the potash deposits in Texas was undertaken by the Geological Survey and the Bureau of Mines of the Department of Commerce. An agent of the Bureau of Mines was sent to discuss details with officials of Texas and the State University and seek their coöperation. The Commerce Department was acting under an appropriation of \$100,000 by Congress, made available for investigating potash properties in the United States.

With regard to published accounts attributed to the Franco-German Potash Sales Agency denying the existence of a potash monopoly, a statement was issued by the Department of Commerce saying: "There can be no question as to the monopolistic character of the Franco-German potash syndicate, since it controls over 90

per cent of the world's potash trade. The United States, its best export market, absorbed during 1925 about 14 per cent of the Franco-German sales of 1,700,000 short tons of pure potash. These importations into the United States constitute about 90 per cent of our total potash consumption."

A new method of making saltpetre, which is used as a fertilizer, from the elements of the air was announced by Prof. K. A. Hofman of Charlottenburg, Germany. His process is as follows: Ammonia gas, made from nitrogen of the air and hydrogen of water, is mixed with air and passed through a mixture of caustic soda and chalk with burnt clay to which a small amount of copper or nickel carbonate is added. This reaction takes place rapidly at temperatures of about 750° F. It is said that if the gases are compressed the action is hastened, and that between 90 per cent and 97 per cent of the ammonia can be induced to form saltpetre.

**TANTALUM.** Chemists who have been working to find a satisfactory substitute for platinum have found an alloy of tantalum that seems to serve the purpose, owing to its great resistance to heat and acids, two properties required in platinum and platinum-iridium. The new alloy is said to last 1600 times longer than platinum itself and to be 20 times cheaper.

**BROMINE.** In August, the Chief of the Chemical Division of the U. S. Federal Tariff Commission announced that the recovery of bromine from sea water, successfully undertaken by the steamship *Ethyl* equipped as a floating chemical factory, offered the greatest immediate means of increasing the domestic supply of bromine. Sea water contains an average of about 0.0004 per cent of bromine and about 1800 gallons of sea water must be treated for every pound of the element recovered. The trial trip of the *Ethyl* indicated a production in excess of the vessel's rated capacity of 100,000 pounds of bromine a month. In a little more than two years, it is estimated, about 300,000,000 gallons of ethyl gasoline were marketed, requiring about 2,800,000 pounds of ethylene bromide, or 2,500,000 pounds of bromine. It is practically impossible to predict the extent to which ordinary gasoline will be ethylized. If the entire gasoline consumption were treated with ethylene, bromide and tetraethyl lead, 90,000,000 pounds of bromine would be required.

Prior to the World War bromine production in Germany amounted to about 1,900,000 pounds a year. The annual output has increased to about 3,000,000 pounds. Owing to the United States import duty on bromine and bromine compounds everything possible will be done to meet requirements from domestic sources before turning to Germany or other foreign countries. It is also possible that bromine may be recovered from the by-product bitters of salt production by solar evaporation of sea water in San Diego Bay, Cal. It was understood that at one plant in California plans were under way for the production of over 300,000 pounds of bromine a year.

**NITROGEN.** It has been found in the Fixed Nitrogen Research Laboratory in Washington that the adoption of small quantities of alkaline oxides in the fixation process increased the yield of nitrogen sufficiently to make the process practical. It also was found that these substances emitted positive electricity in the process.

To determine the nature of the positive current, apparatus was built at Princeton by Prof. H. D. Smyth and Dr. H. A. Barton. Their experiments show that the positively charged particles were single atoms which had lost one electron known as ions. This confirmed the theory of Prof. Hugh S. Taylor of Princeton, who suggested that the presence of certain chemicals intensified chemical activity under the proper circumstances, without entering into chemical change themselves.

According to Dr. Frederick G. Cottrell, of the Fixed Nitrogen Research Laboratory, in commenting on this discovery, approximately 44 per cent of the world's inorganic supply of nitrogen may be obtained by atmospheric fixation, against less than one-fourth that amount before the war. Furthermore, while the quantity made in this way before the war was almost wholly by the arc and cyanamid process, nearly 70 per cent of future fixation will be obtained through the direct synthesis of ammonia.

**JOINING METALS.** A process for this purpose developed by Dr. Irving Langmuir of the General Electric Company in Schenectady, N. Y., is as follows: A stream of hydrogen is passed between two electrodes. The heat of the arc breaks the hydrogen molecules into atoms. The latter, in resuming the condition of molecules a short distance in front of the arc, liberate an enormous amount of heat, which makes the process more efficient than the usual welding methods. Since atomic hydrogen is a powerful reducing agent, it absorbs any oxides that otherwise might form and weaken the metal. It also makes possible the welding of alloys containing chromium, aluminum, silicon, or manganese without fluxing or surface oxidation.

A similar process developed by Peter Alexander of the Thomson Laboratory of the General Electric Company in Lynn, Mass., utilizes the chemical and physical properties of hydrogen and other gases in their molecular state. This process embodies the same chemical advantages as does Dr. Langmuir's. In it the arc is struck between the metallic wire or carbon used as one electrode, and the plate or object to be welded as another electrode. The crater of the arc is always on the object to be welded. Gaseous atmosphere is supplied in a stream around the arc, and for this purpose pure hydrogen, water gas, hydrogen-nitrogen mixtures, or other gases may be used, depending on the nature of the work. This process makes arc welding more efficient in the welding of low-carbon steel, alloy steels, and most of the non-ferrous metals and alloys.

**STUDIES IN PETROLEUM.** The petroleum industry, through the American Petroleum Institute, in 1926 was about to embark on a wide programme of research, and the Institute, in a bulletin (No. 43) issued in July asked for the coöperation of all persons interested in the development of the oil resources of the United States. Twenty-one projects in fundamental research in the geology, physics, and chemistry of petroleum were recommended to the American Petroleum Institute by the Central Petroleum Committee of the National Research Council. Under the head of chemistry are listed nine projects. The first of these, Project 8 in the summary, is to determine the effect of electric discharge upon gaseous hydrocarbons. Project 14 involves the preparation of pure typical hydrocarbons and the study of their behavior when heated alone

and with catalysts. Project 15 covers the determination of the composition of Southern California petroleum and the characteristic reactions of the various components when isolated. Project 16 contemplates the isolation and investigation of thermolabile hydrocarbons present in petroleum. Project 17 involves the isolation and study of the sulphur compounds present in petroleum. Project 18 was to cover the non-catalytic thermal decomposition of pure hydrocarbons and related compounds. Under Project 19, a study was to be made of the relative rates of reaction of the olefines, such as ethylene, propylene, and butylene. Project 20 covers the isolation and investigation of nitrogen compounds present in petroleum. Project 21 concerns the determination of physical and chemical properties of all types of sulphur compounds present in petroleum. It was pointed out in the Institute's bulletin that the proposed work was of the greatest importance to the industry and to the public. The aid of technical institutions was sought, with that of individuals and corporations, that the work may proceed on as broad a scale as possible.

**SYNTHESIS OF GASOLINE.** According to a press announcement from Paris dated October 11, the synthesis of gasoline has been accomplished by M. Audibert, director of the French National Research Company, who submitted a mixture of hydrogen and oxygen to a pressure of 200 atmospheres and filtered its result with the addition of a secret catalytic agent. This product it was claimed could be refined to yield gasoline, kerosene, and other distillates. Several practical difficulties present themselves to prevent the success of this discovery. The yearly consumption of gasoline in France, according to American officials, was 1,000,000 tons, for which France pays about 3,000,000,000 francs. Assuming that the coal process used in an attempt to manufacture sufficient gasoline should meet the needs of the nation, it was estimated that possibly 4,000,000 additional tons of coal would be required by France for this purpose. France in 1926 had to make up a yearly deficit in coal with purchases abroad, in addition to the reparation coal delivered by Germany. To buy this coal would require an outlay of money that would take much from the saving expected from the manufacture of synthetic gasoline. On the other hand if a wood process were adopted, then France would be forced to find 3,000,000 tons of wood each year, an amount which experts think could not be provided for many years. But what is even more important is the fact that the foreign petroleum companies paid yearly about 1,000,000,000 francs in duties and taxes. This money was received without any outlay in its collection, for the oil companies pay the wages of the Board of Customs Agents engaged in the collecting.

**MOTOR FUEL.** Cheaper motor fuels is a subject that is continually before the public and certain items that have been considered during the year are here presented.

Dr. M. C. Whitaker of the U. S. Industrial Alcohol Company in a report to the American Chemical Society wrote: "The composite fuels made simply by blending anhydrous alcohol with gasoline have been given most comprehensive service tests extending over a period of eight years. Hundreds of thousands of miles have been covered in standard motor car, tractor, motor

boat, and airplane engines with highly satisfactory results. With intelligent adjustment of compression and feed to capitalize the advantages inherent in alcohol blends, they easily excel gasoline on every point important to the motorist. The superiority of alcohol-gasoline fuels is now safely established by actual experience. The future of alcohol motor fuels is largely an economic problem. It involves the relations between the cost of alcohol and the cost of gasoline. The cost of alcohol is necessarily linked with the question of cost and available supply of raw materials. As gasoline becomes scarce an economic balance is bound to be established between the price of gasoline, the price of alcohol, and the price and the resultant supply of raw materials. As this economic balance is approached, alcohol will doubtless be used in the making of motor fuels."

From Berlin came the announcement of turning wood into gasoline, yielding a fuel suitable for automobile motors at about a third of the cost of gasoline. Making charcoal from wood is the first step, after which pyroligneous acid is extracted. The procedure from this point is secret, although every step in the process has been demonstrated before experts. Although the process of liquefying coal had been reported many times, by 1926 it had approached a stage of development where chemical engineers in Germany were willing to invest large sums in special plants and machines. Should the performance come up to expectations, it would be only a short time before Germany would be emancipated from foreign sources of supply for both lubricating oil and gasoline.

Also from Germany came the announcement of a newly discovered gas which had been prepared by one of the chemists connected with the Zeppelin works. One cubic meter of the new gas develops 25 per cent more power than a kilogram of gasoline, according to tests, and it is less expensive than gasoline, since by doing away with the weight of gasoline and tanks and by keeping the ship always at the same weight it is unnecessary to blow off large quantities of hydrogen in order to compensate for the loss of weight through fuel consumption. Since compensation for loss of weight is unnecessary when using the new gas it will increase the average speed of the ship, and since hydrogen gas cells do not need frequent filling it will permit landings to be made anywhere. It was further announced that the new huge airship *Friedrichshafen* (to be completed in 1927) would be driven principally by this new gas.

The possibility of a cheaper gasoline was suggested by the publication in Berlin in August of Prof. Franz Fischer's process of synthesizing gaseous, liquid, and solid carbohydrates from carbon monoxide and hydrogen at ordinary pressure. Hitherto all reduction of carbon monoxide without pressure yielded methane, but Fischer found that by using an iron-zinc oxide catalyzer more complicated products were formed. Other metals and their compounds were studied and a cobalt chromium oxide mixture was found to stimulate the formation of gaseous, liquid, and solid carbohydrates when heated to about 518° F. The carbon of the carbon monoxide is said to be made into carbide by the metal and the carbide then split by the hydrogen in the gas mixture. As a result the metal is regenerated and carbohydrates are formed. This

new method yields a pleasant smelling gasoline as clear as water and one which will not harden or become gummy on exposure. The gasoline is highly volatile and is largely made up of unsaturated compounds like olefines, which impart to the gasoline valuable anti-knock properties. This enables it to be used in efficient high-compression motors without objectionable knocking and with great economy.

The investigation as to the poisonous character of ethyl gasoline referred to in the YEAR BOOK for 1925 (p. 147) was completed early in the year and on behalf of his colleagues Surgeon General H. S. Cumming of the Public Health Service reported the following general conclusions: "1. Drivers of cars using ethyl gasoline as a fuel and in which the concentration of tetraethyl lead was not greater than one part to 1500 parts by volume of gasoline, showed no definite signs of lead absorption after exposures approximating two years. 2. Employees of garages engaged in the handling and repairing of automobiles and employees of automobile service stations may show evidence of lead absorption and storage. In garages and stations in which ethyl gasoline was used, the amount of apparent absorption and storage was somewhat increased, but the effect was slight in comparison with that which was shown during the periods of exposures studied and was not sufficient to produce detectible symptoms of lead poisoning. 3. In the regions in which ethyl gasoline has been used to the greatest extent as a motor fuel for a period of between two and three years no definite cases have been discovered of recognizable lead poisoning or other disease resulting from the use of ethyl gasoline. In view of these conclusions the committee reported that in its opinion there are at present no good grounds for prohibiting the use of ethyl gasoline of the composition specified as a motor fuel, provided that its distribution and use are controlled by proper regulations."

**RUBBER.** During the meeting of the American Chemical Society held in Philadelphia in September, a symposium was held at which the latest knowledge affecting the results of botanical, chemical, technical, and engineering research in the United States and abroad was presented. Leading rubber technologists and executives of the industry discussed raw rubber developments, including scientific progress in the plantation rubber industry; in wild rubber, South American and African; and in synthetic or artificial rubber, to perfect which commercially scientists of all civilized nations were uniting in a common procedure. After more than a year of research Lendner and Monte Cambern announced that they had perfected a method by which rubber might be profitably extracted from shale. Almost unlimited quantities of oil shale are available in the vicinity of Perris and Elsinore in California. Eugene Royer, a French engineer, announced in January that he had perfected a method of eliminating the by-products from old rubber and devulcanizing it. The process is in three stages: First, the rubber is submitted to a great pressure and exposed to a special gaseous mixture which devulcanizes the old rubber, eliminating sulphur and other chemicals. Second, it is liquefied by immersion in a catalyzer, which dissolves the rubber and discharges the cotton and other by-products because of their different densities. Third, the liquid rubber is forced through a sort

of clay porous filter which eliminates the catalyzer. The whole operation is said to be made in two machines, in which the catalyzer is used over and over again.

The organization of the American Anode, Inc., by the B. F. Goodrich Company, the Eastman Kodak Company, and the Anode Rubber Company, Ltd., of Great Britain was announced on October 27. This new corporation had for its purpose the manufacture in the United States of rubber goods under processes patented by Dr. Paul Klein of Budapest and Dr. S. E. Shepherd and Dr. L. W. Eberlin of the Eastman laboratories. The processes involve methods of compounding, milling, and vulcanizing rubber. Essentially the principle of the processes is electrolytic deposition of rubber on the anode, which serves as the form or mold. Methods of suspending compounded ingredients in the latex have been perfected, as well as means for maintaining a constant concentration of the latex mixture, without which the commercial development of the process was impossible. It was said greater durability and strength were imparted to the rubber produced by this process and that costs were lowered. Rubber bands no thicker than a thread were manufactured under the new process and were found to be so much stronger than ordinary bands as to defy breaking by the bare hand. Other articles, such as silken thin tobacco pouches, bathing caps, gloves, and hot water bottles, similarly were found to possess far greater strength and resiliency.

**SYNTHETIC WOOL.** Italian synthetic wool, which had recently been placed on the market, apparently cannot replace real wool. According to a report by Australian chemical and textile experts: The synthetic material consists of a mass of short lengths of fine fibres much resembling wool at first sight. Under the microscope the individual fibres appear to be very similar to the fibres of artificial silk. For instance, they appear as smooth-walled and cylindrical bodies striated in the direction of their length, and have none of the cross striations and serrations so typical of natural wool, and on which the latter's strength and spinning properties probably depend. The diameter of the fibre examined was fairly uniform, in the neighborhood of one-thousandth of an inch. From the point of view of fibre diameter, the artificial wool is fine enough, but as regards its felting, spinning, luster, and wearing properties little evidence was possible from a microscopic examination. It is claimed therefore the synthetic product is inferior to real wool because the absence of serrations means that the artificial fibre will not fit together as wool fibre does, and because the artificial fabric does not combine warmth and porousness in the way wool does. Nor does it possess the deodorant qualities of wool.

**GLASS.** Glass which can be bent or broken without splintering and which will bounce if thrown on the floor, was announced. It is as transparent as ordinary window glass, non-inflammable, and remains clear under all atmospheric conditions. It is hard enough to be safe from accidental scratching, but it can be broken by the bare hand without risk of cuts, as the glass breaks without jagged edges. It is only half the weight of ordinary glass. It was invented in Austria and its use has been recommended for automobile shields.

**COLORING GEMS.** According to Dr. C. Everett

Field, director of the Radium Institute in New York City, it is possible to change yellow diamonds, which are comparatively cheap and plentiful, into valuable blue-white diamonds by means of a radium treatment. The process consists in placing enough radium near the diamonds to draw off the impurities in the stone which cause the yellowish color. If more radium is used, the change will occur more rapidly. The quantity is also governed by the relative hardness of the jewel. It was found that 100 milligrams of radium, worth about \$8000, will change one diamond in four days' time. The experiments extended over four years, and in that time no stone which had been changed to blue-white reverted to its original hue. Experiments were under way with other precious stones, beginning with the emeralds, to discover how they would be affected by the radium treatment. These experiments were made with diamonds, silicas, and other glasses and the results so far lead to the belief that the change is permanent.

**PAPER.** Successful experiments conducted in the Forest Products Laboratory of the University of Wisconsin resulted in the production of paper from eucalyptus wood grown in São Paulo, Brazil. A small roll run through the press of a newspaper showed favorable printing quality and ample strength for use in high-speed presses. This paper can be produced at about half the cost of the present imported news print. The eucalyptus can be grown in California, New Mexico, Arizona, and Florida, where the climate is such that the tree would probably reach pulpwood size in less than ten years, giving what research workers believe will be a perpetual supply of paper to fill the shortage due to depletion of spruce.

A report from Bombay, India, dated October 9, says that forest research experts in India have discovered how to use bamboo as pulpwood in the manufacture of white paper. The process has been perfected after 15 years' experimenting by the Forest Research Institute and College at Dehra Dun. It is said that by the new process India will be in a position to supply the paper demands of a large part of the world. The bamboo, which has been looked upon for centuries as useless, now seems destined to assume a prominent place among the national resources of the British empire. Plans for the erection of pulp mills and paper factories are being fostered by several provincial governments in India.

**NEW TANNING ACID.** Researches by W. E. Emley of the Bureau of Standards at Washington show that a treated and concentrated extract made from the waste liquors in the manufacture of paper pulp can satisfactorily be used for tanning hides, particularly when blended with the ordinary vegetable tanning material. Inasmuch as this waste can be obtained for nothing, the only expense being freightage to the point of use, the cost of tanning may consequently be very materially reduced. Most pulp factories are located along streams, and this waste pumped into the waterways causes pollution and has given rise to many law suits. To pump it instead into large vats and sell it offers a new source of revenue.

**PROTECTIVE PAINT.** The loss to the world due to the rusting of iron runs into millions of dollars, and the problem of its prevention has been studied by many scientists. Zinc, tin, nickel,

and ordinary lead paint are useful preventives, but they do not last and have to be reapplied frequently. A discovery by Dr. A. V. Blom of Berne, Switzerland, of a new lead paint which affords complete and permanent protection to iron was announced in June. It is made by melting lead in an electric furnace and blowing through it air and certain reducing gases, so that a dross or scale is produced which consists of colloidal, or extremely finely divided lead dispersed in yellow lead oxide. When it is powdered and mixed with a specially prepared linseed oil, and applied to an iron surface, very minute particles of lead separate out and gradually penetrate into the surface of the iron. The presence of the lead in the treated iron has been proved by photomicrographs and by chemical analysis. Iron objects painted with this new pigment have not shown any signs of rusting after prolonged exposure, or after being heated in steam.

**SUGAR.** By a chemical process that is known as acetylation the United States Bureau of Standards has produced a very rare sugar known as gentiobiose, which, although of no great commercial significance, is expected to prove valuable to industrial chemists in studying problems in the manufacture of corn sugar. The sugar is an extract of the waste liquor known as hydrol which results from the manufacture of crystalline corn sugar or dextrose, and has caused apprehension in the sugar industry because of its quantity and undesirable influence on the duration of the manufacturing process and sugar yield. The name gentiobiose was given to the by-product because up to this time the gentian root had been known as the only source.

**CRYSTALLINE INSULIN.** In a significant address—the sixth annual Pasteur lecture—given in February before the Chicago Institute of Medicine, Prof. John J. Abel of the Johns Hopkins University made public announcement that he had obtained a crystalline form of insulin and exhibited a small specimen of the product. Lantern slides showed the crystals to be rhombohedral, but other data were not presented. The chemical and medical world will await with great interest further developments, particularly the proof of the identification and chemical constitution of the product.

**THYROXIN.** Of the many and recent applications of chemistry to biology it has been said that: "The researches of E. C. Kendall leading to the isolation and identification of thyroxin have given new insight into the action of the thyroid; like epinephrine, the pure substance is at the disposal of the physician. The artificial preparation of thyroxin is only a question of time and effort, and one more outpost of the bulwarks of life will thus have been conquered by the chemist."

**CHEMILUMINESCENCE.** Such is the term applied to a new kind of light caused by chemical reactions which involve no burning or combustion. The materials which had proved most successful in this capacity were chlorine gas and sodium vapor. These two elements brought together in this form combine to produce sodium chloride, or common table salt, giving off in the process a brilliant yellow light. About one-tenth of the energy involved in this reaction is converted into light. It was expected that tubes of this material would find practical use for special scientific experiments and among surgeons, due to the fact

that the light they give off is of only one color and not composed, like ordinary daylight, of all the colors of the spectrum. Following somewhat similar lines a method had been devised in the United States for making luminous compounds. According to a patent granted in 1926 the phenomenon of phosphorescence can be produced by the reactions of two classes of substances known as "luminophores" and "phosphorogens," with a base of some mineral carbonate and a combustible material such as starch or sulphur. Luminophores are compounds of the lighter metals, such as sodium and potassium, while the phosphorogens are compounds of heavier metals, such as silver, nickel, and the radioactive uranium and thorium. These latter make the limestone base phosphoresce and the former impart the desired color to the glow.

**A NEW THERMOMETER.** It was announced in January that a thermometer capable of registering a temperature of more than 1800°F. had been developed in the Thomson Research Laboratory of the General Electric Company in Lynn, Mass. Instead of glass, which would melt at a much lower temperature, fused quartz was used for the stem and bulb of the new instrument. Mercury, which would boil and explode at such a heat, was eliminated and gallium, one of the rarer metals, was used. A temperature of 1000°F. is the maximum which the mercury-in-glass thermometer can stand and such thermometers are inaccurate at high temperatures, according to experts.

**NECROLOGY.** Conspicuous among those who died during the year were: Albert Brown Lyons, Government chemist for Hawaii (died, Apr. 13, 1926); Edward Swoyer Breidenbaugh, professor of chemistry and mineralogy at Pennsylvania College (died, Sept. 5, 1926) and Auguste J. Rossi, a consulting chemist of New York City and a winner of the Chandler medal (died, Sept. 18, 1926).

**CHESAPEAKE AND DELAWARE CANAL.** See CANALS.

**CHESS.** Two master chess tournaments were held in the United States during 1926, in both of which prominent European experts participated. The first tourney took place at Lake Hopatcong, N. J., José R. Capablanca, the world champion, being the winner with six victories and two defeats. Next in order came Kupchik, Maroczy, Lasker and Marshall, the United States champion. Marshall won the tourney that was conducted by the Western Chess Association at Chicago, Maroczy and Torre tying for second honors.

Among the leading tourneys held in Europe was the annual Hastings Congress where Alekhine and Vidmar finished in a deadlock for first place. Spielmann triumphed at Semmering with Alekhine second. Nimzowitch was the winner at Dresden, Alekhine again finishing second. Gruenfeld and Monticelli divided the honors at Budapest while in the Berlin tourney Bogoljubow won.

New York University for the second successive year won the championship of the Intercollegiate Chess League, Princeton carrying off the laurels in the "H.Y.P.W. Chess League" (Harvard, Yale, Princeton and the United States Military Academy.)

**CHESTNUT BLIGHT.** See FORESTRY.

**CHICAGO SANITARY DISTRICT.** See SEWERAGE AND SEWAGE TREATMENT.

**CHICAGO, UNIVERSITY OF.** An institution of higher education situated on the Midway Plaisance of the Chicago South Park system, Chicago, Ill.; founded in 1890, largely through gifts of John D. Rockefeller. The University, with its affiliated institutions, occupies for educational purposes over 50 buildings and 180 acres of land, including the site of the Yerkes Observatory at Williams Bay, Wis. The net total registration for the fall quarter of 1926, exclusive of 6000 in the home study department, was 7724, distributed as follows: graduate school of arts, literature, and science, 1337; undergraduate school of arts, literature, and science, 2828; divinity school, 167; medical courses, 205; Rush Medical College, 308; law school, 417; school of education, 134; school of commerce and administration, 472; graduate school of social service administration, 87; university college, 2146. The summer quarter enrollment for 1926 was 6532. There were 678 faculty members above the rank of assistant.

The total productive endowment of the University in September, 1926 was \$36,035,929.86, and its total resources, including buildings and land, approximated \$64,000,000. In the autumn of 1926 a drive to increase the resources of the University resulted in subscriptions designated chiefly for endowment by the alumni amounting to over \$2,000,000 and by others to over \$7,000,000. Available for medical instruction and research was an endowment of approximately \$17,000,000, including that of several affiliated institutions. The library contained 739,213 volumes and about 250,000 pamphlets. The University had obtained a practically complete set of all known Chaucer manuscripts.

During the year the grand stands at Stagg Field were enlarged to accommodate 48,000 spectators. Under the direction of the Oriental Institute of the University, excavations were carried on at Megiddo, Palestine, the ancient Armageddon, as well as the investigation and research conducted at Chicago House, Luxor, Egypt. A gift of \$37,500 was made toward this work by John D. Rockefeller, Jr., in addition to his gift of \$25,000 in 1925 for the purchase of a remarkable collection of Phœnician monuments. In 1926 the General Education Board contributed \$250,000 for the endowment of the Institute and \$30,000 for alterations in the Haskell Oriental Museum. The Carnegie Corporation granted \$1,385,000 for the establishment of a graduate library school to organize research and instruction around the broad conception of a library as a tool of education and research. Dr. Frank Billings of Chicago endowed by a gift of \$25,000 the Frank Billings Library. Mrs. Anna L. Raymond of Chicago gave \$100,000 to found the James Nelson and Anna Louise Raymond professorship for instruction and research in the Medical School, and Edwin Francis Holmes bequeathed \$50,000 to establish the Edwin F. Holmes Fund for Medical Research. By the will of Harriet G. Smith the University received \$283,000 to establish and maintain a hospital for contagious diseases in connection with its medical school. Buildings under construction or completed during the year, involving an expenditure of about \$8,500,000, included the University Chapel, seating capacity 2000, buildings for the Medical School, one of which was the Albert

Merritt Billings Hospital, the Whitman Laboratory for Experimental Zoölogy, the Rawson Laboratory, the Joseph Bond Chapel of the Divinity School, and Wieboldt Hall for the use of the Department of Modern Languages and Literatures. President, Max Mason, Ph.D., LL.D.

**CHILD FEEDING.** See FOOD AND NUTRITION.

**CHILD LABOR.** Despite the difficulties of obtaining immediate success, agitation for the ratification of the proposed Federal child labor amendment in the United States was continued by various interested bodies. The American Federation of Labor, at its October convention, stressed the need of national measures to combat this social evil, and President Green made a number of speeches during the year urging both state and Federal action. The National Women's Trade Union League, at its Kansas City convention, also voted to regard the ratification of the Federal child labor amendment as of first consideration.

**PRESENT CONDITIONS.** An indication of the wide-spread prevalence of child labor in the United States is furnished by the brief but incisive report of the Executive Council of the American Federation of Labor to the 1926 convention. Basing itself upon the census returns and upon special surveys, the report names the following states as having the largest numbers of child workers between the ages of 10 and 15: Georgia, 89,000; Alabama, 84,000; Texas, 81,000; Mississippi, 70,000; South Carolina, 64,000; North Carolina, 62,000; Pennsylvania, 56,000; New York, 50,000.

The same report gave the results of an investigation in the beet and vegetable fields of Colorado: "The children do exhausting work in the hot sun, hoeing, weeding, pulling vegetables; 650 children were found working in three counties; 24 per cent were nine years or under. Hours—average nine and one-half a day, ten in beets. Schools—three-fifths of all children and nine-tenths of migratory children missed school for work; nearly 50 per cent of all children and 80 per cent of migratory children were retarded."

A survey of industrial home work among children in New Jersey cities was conducted by the United States Children's Bureau during the year. In Newark alone 849 children were found working in the 459 homes visited as representative of the families doing industrial home work. "Speeding up" of the children was common, the bureau reports, particularly in the seasonal industries. "Although the children as a rule work irregularly," it is stated, "they may be kept at their tasks for long hours during the season when employers are giving out large quantities of work. Even while school was in session 13 per cent of the children worked four, five, and six hours a day, which meant night work for many of them." The State of New Jersey licenses all industrial home work and is supposed to revoke the licenses whenever children are drawn into the service. Great difficulty is reported in enforcing this provision, and the State department of labor has urged the amendment of the law so as to punish the employers or contractors in case of violation of the child labor statute.

The Children's Bureau also made a comprehensive survey of the number of children between the ages of 14 and 16 receiving employ-

ment certificates. The results are indicated by the accompanying table:

State and city	1924	Per cent of increase (+) or decrease (-) as compared with 1923		Per cent of increase (+) or decrease (-) as compared with 1924	
Alabama .....	911	.....		1,005	+ 10.3
Birmingham ...	149	- 37.9		179	+ 20.1
California:					
San Francisco ..	243	- 36.2		267	+ 9.9
Connecticut .....	5,995	.....		7,605	+ 26.9
Bridgeport .....	605	- 41.4		785	+ 29.8
Hartford .....	572	- 38.2		676	+ 18.2
New Britain ....	848	- 30.8		478	+ 37.4

Reading .....	903	- 19.6		1,155	+ 27.9
Tennessee .....	2,540	.....		3,062	+ 20.6
West Virginia ...	743	.....		570	- 23.3
Wisconsin:					
Milwaukee ....	1,926	- 49.0		2,481	+ 28.8

The bureau states that the children between 14 and 16 years of age receiving work permits in the places reporting to the bureau are probably more than half the total number of these ages going to work throughout the country in occupations for which permits are required. The bureau adds: "Although they include neither the large number entering occupations such as farm work and domestic service, for which no certificate is required, nor those going to work without complying with the law, the statistics are representative of conditions in all sections of the United States and in most of the important child-employing centres as regards at least the legal employment of children of work-permit age."

**STATE ACTION.** A *Rhode Island* law raised the educational requirement for employment certificates for children from the completion of the sixth to the completion of the eighth grade, with the alternative of eight years' school attendance. The law also requires a child to attend school until he is 15 even though he has completed the eighth grade, and changes the requirements as to special employment permits for

mentally defective children and for children working outside of school hours and during vacation.

A Louisiana law established a maximum 8-hour day and 48-hour week for children under 16, improves the provisions as to the issuance of employment certificates for children going to work, and requires a certificate of physical fitness as a prerequisite to an employment certificate. The law goes into effect July 1, 1927.

Both New York and Virginia passed laws affecting to some extent the hours of work of minors over 16. In New York State such minors are required to attend continuation schools for a few hours a week until the age of 17.

**INTERNATIONAL ACTION.** At the annual meeting of the Child Welfare Committee of the League of Nations, held in Geneva in the spring of 1926, a resolution was passed expressing the hope that the International Labor Office would continue to make representations to the governments for the ratification of the international child labor convention.

**CHILD WELFARE.** The activity in this field of social welfare continued undiminished. One need only read the Child Welfare news summary published by the Federal Children's Bureau to get an idea of the extraordinary enterprise characterizing not only most of the States of the Union but all civilized nations as well. There are being carried out currently examinations into and legislation on every phase of child training, psychology, and care. One reads at the same time of child-care programmes launched by the American Legion, the League of Nations, the State of Kentucky, and the countries of China and Spain. In New York, a study is made of the health of street newsboys, in Kentucky of midwifery and infant mortality, in the South of the heights and weights of negro children as compared with whites. And so it goes.

An example of this great preoccupation is furnished by the work of the Federal Government. In the fiscal year 1926 nearly one million babies and 180,000 expectant mothers were reached by the national programme for the betterment of maternal and infant health. This work was carried on by 43 States with the co-operation of the Federal Children's Bureau. As a result of the passage of the Maternity and Infancy Act in 1921 the Federal government pledged itself to aid those States expressing a willingness to coöperate. By 1926, 43 States and Hawaii had accepted the Act.

The size of the programme may be indicated by the fact that during the year 20,155 prenatal and child health conferences were held, where 10,554 mothers and 159,244 children received health examinations.

There is considerable ground for pride as a result of this work, but great work still remains to be done. In no field so much as maternal mortality and morbidity, perhaps. In an important survey conducted by the Children's Bureau, these facts were adduced: Maternal mortality rates in the United States are to-day among the highest in the civilized world. There has been little, if any, downward trend since 1900. The countries of Denmark, Finland, Italy, Japan, the Netherlands, Norway, Sweden and Uruguay have rates less than half that of the United States. In 1921 some 20,000 women died in child birth making the rate 6.8 per

1000 live births. The 1924 rate was 6.6. Analysis of the causes of maternal deaths showed that two-fifths of the deaths were due to puerperal septicemia and almost 100 per cent preventable through careful asepsis. Other causes of death were puerperal albuminuria, and convulsions (both preventable through adequate medical care during the prenatal and confinement periods) and accidents of pregnancy, hemorrhage and accidents of labor.

Certain factors are important in fixing the rate. It was established that the risk of maternal death was greater in plural births and for mothers under 15 and over 45. The lowest rate was found to be among mothers between 20 and 24. Poverty played an important rôle. Also the negro maternal death rate was 67 per cent higher than the white rate. However, the rate for foreign-born white mothers was slightly lower than for native-born white mothers, the lowest rate in the foreign group being for mothers born in Russia. Next came the Italian-born group.

The report had this to say about prevention: "Almost all the mortality from puerperal septicemia is preventable. Puerperal septicemia is infectious in origin, and its prevention depends upon the vigorous observance of asepsis. The Australian Committee appointed to study the causes of death and invalidity in the Commonwealth states: 'Puerperal septicemia is probably the greatest reproach which any civilized nation can by its own negligence offer to itself. It can be prevented by a degree of care which is not excessive or meticulous, requiring only ordinary intelligence and some careful training.'"

**PUBLIC AID TO DEPENDENT CHILDREN.** From 1909, when the idea was first broached, to 1926, 42 States put on their statute books acts authorizing assistance for dependent children in their own homes. These acts are variously called "mothers' pensions," "mothers' allowance," "mothers' assistance fund," "widows' compensation," "aid for dependent children," etc. The six States which have not yet passed such legislation are South Carolina, Georgia, Alabama, Mississippi, Kentucky, New Mexico. In most States, to-day, such aid is being given to the mother whose husband is dead, or a deserter, or totally incapacitated, or imprisoned, or in an institution for insane, feeble-minded or epileptic. In fact, in only Maine, New Hampshire, Massachusetts, Rhode Island, Washington, Colorado, and Nevada is the language of the law general, and only in Utah, New Jersey, Connecticut, Maryland and Texas is aid given to widowed mothers only. Most States do not require citizenship or declaration (only 11 States do so); however, most States require a certain period of State residence. The surveyor (a member of the Federal Children's Bureau) sums up the general characteristics of these laws:

1. Application broad enough to permit aid whenever by such means a suitable home may be maintained.
2. Age limitation to conform with education and child labor laws.
3. Amount of aid to be based on the needs of each individual family, with due regard to other available resources.
4. Inquiry in each case to determine the home conditions and the assistance needed for the proper care of the children.

5. Continued oversight in order that the welfare of the children may be protected and the aid adjusted to meet changing conditions.

6. Provision of safeguards necessary to protect the public treasury against fraudulent or unwarranted claims and against burdens that should be borne by other communities or by individuals legally responsible and able to furnish support.

7. Administration lodged in the public agency best fitted to carry out the provisions of the law as a constructive child-welfare measure.

8. Appropriation adequate to carry out the purpose of the law, with respect both to funds required for aid and to expenses of administration.

9. Some form of general oversight by the State combined with educational activities to develop high standards in the work of the local administrative agencies.

**PUBLIC HEALTH.** The public health reports of the Metropolitan Life Insurance Co. are always important since its industrial policy-holders group constitute one-seventh of the population of the United States and Canada and one-fourth of the rural population. The 1925 figures were released early in the year. There were two items of importance, the decrease in the tuberculosis death-rate, and the decrease in the leading epidemic diseases of children. The tuberculosis death rate was 98 per 100,000 (a decrease of 50 per cent since 1915). The death rates for measles, scarlet fever and diphtheria reached their lowest points. The combined rate for these and whooping cough was 19.7 per 100,000 (a decline of 25 per cent from the former minimum rate). It is significant to note that the rate of 19.7 for all four diseases was less than the 1920 rate for diphtheria alone.

The history of the diphtheria rate was particularly significant. In 1925 the rate was 10.2; in 1920 it was 20.4. Another low record in diseases was reached in the puerperal diseases group where the rate was 16.9 per 100,000 as compared with 17.2 in 1924. Against this record must be placed that of the increasing automobile accidents rate. This was 16.7, an increase of 50 per cent over 1920. At least 40 per cent of automobile accidents resulting in death were among children under 15.

**INFANT MORTALITY.** The Census Bureau announced that the infant mortality rate, in the birth-regulation area, for 1925 was 71.5 as compared with 71.0 in 1924 and 77.7 in 1923. (Compare this with New Zealand's rate of 39.96 for 1925.) Maryland showed the highest rate with 90.4 and Oregon the lowest with 51.2. Note the infant mortality rates for these registration cities: New York, 62.4; Chicago, 74.8; Philadelphia, 70.8; Pittsburgh, 81.5; San Francisco, 55.5; Kansas City, 87.5. The American Child Health Association, in a study of city rates for 1925, tabulated returns for 632 cities in the registration area. The rate for these cities was 72.6. In the birth-registration area the cities having 250,000 population had a composite rate of 71.2; those between 10,000 and 25,000, 76. The lowest rate was 32 and was reached by Stonington, Conn. and Winona, Minn., both in the 10,000-25,000 class. The highest rate was 156, that of Martinsburg, W. Va., also in the above class.

**INSTITUTIONAL CARE.** An important bulletin was released by the Bureau of the Census indi-

cating the number of children under institutional care in 1923. An analysis of the figures reveals that 404,078 children were in institutions or under the supervision of child-placing agencies in the United States as of Feb. 1, 1923. Of these, 204,888 were in institutions, 51,164 in free homes, 22,281 in boarding homes, 121,441 under supervision in their own homes and 4904 were away temporarily from the institutions but still under supervision. Of the 204,888 in institutions, 122,557 were in institutions for dependent children, 10,001 were in institutions for adults and children, 5053 were under the care of child-placing societies; 22,822 were in day nurseries, and some 30,000 were in institutions primarily for delinquents. It was estimated that 121,000 were being supervised in their own homes as a result of public grants. It is interesting to note that 1992 children were in almshouses, 580 in public jails and 1650 in prisons and reformatories.

**JUVENILE DELINQUENCY.** An investigation— incomplete but important in that there are no data on this subject—conducted by the Children's Bureau showed a downward trend. Statistics were procured from the juvenile courts of New York, Philadelphia, Boston, Chicago, Buffalo, Detroit, Minneapolis, New Orleans, Providence, Richmond, Rochester, St. Louis, Seattle and Washington for the years 1915 through 1924, and in some instances for 1925. There were found decreased juvenile delinquency rates over the period in New York, Boston, Buffalo, Chicago, New Orleans, Providence, Richmond, St. Louis, and Washington. Increased rates were found in Detroit, Minneapolis, Philadelphia and Seattle. Comparisons between number of children committed to penal institutions as of 1910 and 1923 are illuminating. In 1910 the total number of delinquents between the ages 10 to 17, admitted to institutions was 24,854 or 171.7 per 100,000 of this age group. The figure for 1923 was 25,565 or 156.5 per 100,000. Thus, taking into consideration the growth of population there was a marked decrease over the period.

**RHODE ISLAND.** Early in the year the Rhode Island Children's Law Commission, appointed in 1925, made public its report. It recommended to the governor and legislature the enactment of some 27 measures the purport of which was the general strengthening of the State's welfare legislation. These particular proposals may be cited: Creation of a children's bureau in the State's Public Welfare Commission to concern itself with the protection of defective, dependent, neglected and delinquent children; the licensing of infants' boarding homes, maternity hospitals, day nurseries; extension of the activity of the juvenile court to cover neglected and dependent children, appointment of a State probation officer to organize a probation staff serving all the courts of the State; provision for the special treatment in adult courts of juvenile offenders charged with murder or manslaughter; the creation of a six-months' trial period in adoption cases; more adequate procedure for children born out of wedlock; the establishment of a joint natural guardianship for children.

Other laws recommended included: The raising of the compulsory school-attendance age to 18, unless a child is employed; establishing of special classes for mentally retarded children; permitting children of 14 to obtain part-time

work certificates; prohibiting night work for children under 16 years between 7 P.M. and 6 A.M.

In June, these 27 bills were presented, and all but 5 were passed; these five measures had to do with the regulation of child labor.

NOTES. Among the important conferences of the year was that held in Washington, January 11-13, by the State directors administering the Federal Maternity and Infancy Act. There were in attendance representatives from all the States but four. The exhibit attracted particular attention. These included midwife equipment, garments for mothers and babies, posters, etc. The following, among others, spoke: Dr. Robert L. De Normandie, Dr. William H. Davis and Dr. Douglas A. Thom.

An indication of the interesting progress being made was the creation by the National Research Council of a new child development committee. At the committee's first meeting some 28 research workers were in attendance. Dr. Bird I. Baldwin was elected chairman. Sub-committees were erected for the following purposes: To study animal development in relation to child development; to study the growth, nutrition, and mental hygiene of the child, and to study the research literature.

The Metropolitan Life Insurance Co., has approximated the cost, to a family of the \$2500 income class, of raising a child to the age of 18. The total cost is estimated at \$7238 and is made up of the following items: Cost of being born, \$250; food, \$2500; clothing and shelter, \$3400; education (minor items) \$50; health, \$284; recreation, \$130; insurance \$54; sundries, \$570. To this must really be added the cost of schooling supplied by the community which, in New York State, comes to \$1100.

**CHILE**, ché'la. A South American republic lying on the western Pacific coast of the southern part of the continent, extending from Peru to the southernmost point. Capital, Santiago.

**AREA AND POPULATION.** The extreme length of Chile is 2628 miles and the average width is 177 miles. At the census of 1920 the population was 3,754,723. The republic is divided into 23 provinces, subdivided into 82 departments and one territory (Magallanes). The populations of the principal cities, according to the census of 1920, were: Santiago, 507,296; Valparaiso, 182,242; Concepcion, 64,074; Antofagasta, 51,531; Iquique, 37,421; Talca, 36,079. The urban population made up 46.6 per cent of the total. The great majority of the population are of European descent. In 1920 the foreigners numbered 115,763, as against 134,524 in 1917. The natives comprise the Fuegians, for the most part nomadic and living in the southern territories; the Changos, civilized and employed as laborers, in the coast region; and the Araucans, who live in the valleys and on the western slopes of the Andes and number about 101,118. The movement of population in 1925 was: Births, 159,017; deaths, 116,943; marriages, 28,862. On Dec. 1, 1925, the population was estimated at 3,944,142. Immigration is small but is encouraged by the government.

**EDUCATION.** Primary instruction is free and compulsory. According to the latest available statistics there were 3769 public primary schools with 425,056 pupils and 9104 teachers, 484 private primary schools with 1490 teachers and 62,139 pupils, 15 public normal schools with 444

teachers and 2462 pupils, 97 public and 102 private secondary schools with 38,790 and 20,068 pupils, respectively, and 11 commercial schools with 187 teachers and 3187 pupils. There are various schools of mines, professional schools, and other special institutions. For higher education there are the University of Chile, belonging to the State, the Catholic University, and two industrial universities, situated at Valparaiso and Concepción. Other noteworthy institutions are the Pedagogical Institute, the National Conservatory of Music, the National Observatory, etc. There are in addition various lyceums and colleges maintained in the provinces.

**PRODUCTION, MINERALS, ETC.** The chief pursuits of the country are agriculture and mining. The agricultural zone lies in the centre of the country. The climate permits of the raising of tropical products as well as those of the temperate zone. Cereals are the leading crop and wheat is the most important. The acreage and production in metric quintals of the principal crops in 1925-26 were as follows: Wheat, 501,806 acres, 16,142,420 quintals; barley, 126,096 acres, 2,289,826 quintals; oats, 92,348 acres, 1,564,964 quintals; maize, 50,359 acres, 543,200 quintals; beans, 90,009 acres, 702,124 quintals; peas, 2823 acres, 21,940 quintals; potatoes, 68,074 acres, 270,890 tons; vines, 171,480 acres, 33,249,018 gallons of wine. Fruit growing has latterly increased and covers an area of about 20,000 hectares. On Jan. 1, 1924, the livestock of Chile comprised: Horses, 329,454; asses, 33,580; mules, 43,816; cattle, 1,995,538; sheep, 4,569,166; goats, 525,106; and pigs, 263,330.

Chile is very richly endowed with minerals. She is the second largest producer of copper in the world, the output in 1925 being 175,994 tons. Other important minerals are gold, silver, cobalt, manganese, coal (1,440,425 tons in 1925), nitrate, borate, salt, sulphur, guano, and iron ore. The iron resources have not been developed to any great extent but are reported to be very rich. The deposits are found in the provinces of Atacama and Coquimbo. The coal region lies to the south of Valparaiso. By far the most important item of commerce is nitrate of soda, which is found chiefly in the nitrate section of the desert of Atacama. According to the United States Bureau of Foreign and Domestic Commerce, it is doubtful if there exists a more barren stretch of coast line than that of northern Chile, yet beneath the surface of much of the sandy waste of the hinterland, commonly called the Desert of Atacama, lie valuable deposits of sodium nitrate, highly useful as a nitrogenous fertilizer and basic element in the manufacture of explosives and heavy chemicals, the exploitation of which has for many years furnished the chief source of national wealth. These nitrate deposits are most highly concentrated in the provinces of Antofagasta and Tarapaca and are situated 15 to 90 miles inland at an elevation varying from 3000 to 8000 feet above sea level. A total area of 91,000 square miles of Chile's approximately 300,000 square miles of territory is included within these provinces. The value of exports through the nitrate ports in 1924 was \$155,908,421, which represented 71 per cent of Chile's total exports during that year.

Up to the outbreak of the World War, Chile had virtually monopolistic control of the world's nitrogen supply. The Central Powers, being cut off from this supply, developed within their own

territory a large industry for producing atmospheric nitrogen to meet their needs for explosives. At the termination of the war, Germany converted its war plants to fertilizer factories. The total production of synthetic nitrogen in Europe now has reached such proportions and the price has been so reduced that its competition has destroyed the one-time monopoly of the Chilean producers of natural nitrates. The world consumption of nitrogen has increased tremendously, but in 1894 Chilean nitrates supplied 73 per cent of the world's nitrogen, whereas in 1913-14 they furnished 53 per cent and during 1925-26 only 26 per cent.

In December the Pan American Union published the following table which was taken from the latest annual statistical report of the Chilean government on the conditions of manufacturing industries within the country:

	1924	1923
Number of establishments	7,681	8,141
Capital (pesos, paper) . .	1,676,731,190	1,291,917,970
Number of employees and operators	90,641	89,475
Wages and salaries . . .	197,081,424	172,244,583
Number of machines . . .	31,287	28,272
Motors { Number . . .	5,949	5,375
Horsepower . . .	263,071	257,009
Fuel (value in pesos, paper)	40,604,554	38,515,393
Raw material (value in pesos, paper) . . . .	753,451,265	623,276,084
Annual production (value in pesos, paper) . . .	1,351,254,634	1,195,588,829

COMMERCE. According to the President's message of May, 1926, the foreign commerce of Chile in 1925 amounted to 1,034,045,200 gold pesos of which 407,792,592 pesos represented imports and 626,252,608 pesos exports. The following table from the *Statesman's Year Book* for 1926, shows the principal articles of export and import in 1925:

Imports		
	1924 Pesos	1925 Pesos
Coal . . . . .	3,451,896	2,856,351
Petroleum . . . . .	13,939,617	20,729,194
Sugar . . . . .	17,897,648	21,160,207
Paper . . . . .	8,996,558	8,074,823
Automobiles . . . . .	2,914,427	2,552,733
Tea . . . . .	5,036,957	4,472,786
Exports		
	1924 Pesos	1925 Pesos
Nitrate . . . . .	297,629,094	306,887,909
Iodine . . . . .	16,868,286	24,034,234
Wool . . . . .	10,788,043	19,932,254
Copper . . . . .	127,694,038	117,039,406
Borate of lime . . . . .	5,793,311	7,956,739
Frozen meat . . . . .	6,645,639	8,776,467

FINANCE. According to the President's message of May 22, 1926, the government receipts for 1925 were 542,450,389 paper pesos and 179,550,281 gold pesos, while expenditures for the same time were 635,252,447 paper pesos and 169,834,126 gold pesos, giving a deficit of 63,653,593 paper pesos after reducing the gold balance to paper. As the previous deficit accumulated from other years amounted to 34,155,000 paper pesos, uncollectable debts owing to the government to 40,283,960 paper pesos, and expenditures to which the government is obligated by various decree laws to 6,494,200 pesos, the deficit at the end of 1925 totaled 144,586,754 paper pesos. The external debt amounted on Dec. 31, 1925, to £26,083,092 and \$25,037,578, while the internal debt

was 4,220,000 gold pesos and 263,787,031 paper pesos. The gold guarantee of the nation was 406,078,572 pesos and the paper guarantee 42,358,000 pesos. The first Chilean loan in four years was issued in London, Jan. 20, 1926, by the Anglo-South American Bank, in the form of 6 per cent bonds of the Government of Chile, for an amount of £2,809,000, at 94. The issue was an immediate success, the lists only having been open for a few hours. The bonds will be redeemed by means of a cumulative sinking fund of one-half per cent per annum, to be applied yearly by drawings at par or by the purchase of bonds at or under par exclusive of accrued interest. The proceeds of the issue, which forms part of a total of £7,640,000 authorized, will be used to liquidate the outstanding floating debt amounting to approximately £1,000,000, incurred on port developments, and for the extension of similar works. The yield is approximately 6½ per cent, which is relatively low. The previous London issue on behalf of Chile—£1,657,500, 7½ per cent bonds at 95, made in 1922—afforded about one per cent more, and even at their current price of 102½ give a higher yield than these new bonds.

On September 2, the President of Chile sent to Congress the budget for 1927 which calculated the revenues at 890,854,046 pesos, while the expenditures were estimated at 1,029,342,706 pesos. However, these expenditures included items for which special funds to the amount of 122,460,000 pesos may be used. The loan from Blair & Co. is also to be canceled with funds from loans to be contracted for the conversion of the public debt. Therefore, the part of the budget of expenditures to be covered by ordinary revenues amounts to 906,882,705 pesos, which leaves under the present calculations a deficit of 16,028,659 pesos. It was hoped that much of this could be eliminated by a revision of the needs of the various ministries and a policy of economy.

COMMUNICATIONS. The shipping entered and cleared at the ports of Chile in foreign trade in 1925 was as follows: Entered, 1245 vessels of 3,348,338 tons; cleared, 1191 vessels of 3,247,319 tons. The railway mileage in operation in 1925 consisted of 9480 kilometers, of which 5840 kilometers were owned by the state and 3640 by private companies. The operations of the state railways according to their annual balance for the year ended Dec. 31, 1925, resulted in a profit of 8,026,325 pesos. Gross revenues amounted to 223,459,321 pesos and expenditures to 215,432,995 pesos. Total income of the northern system amounted to 12,784,166 pesos and its operating expenditures reached 18,432,372 pesos, showing a deficit for the year of 5,648,206. The Southern System received 210,075,155 pesos and disbursed 197,000,623, showing a surplus of 13,674,531 pesos. The gross revenues of these railways for 1925 exceeded that of 1924 by approximately 26,000,000 pesos but operating expenditures were also heavier. The total surplus, however, exceeded that of the previous year by approximately 3,000,000 pesos. The general balance sheet of the state railways places assets at 845,873,726, and liabilities at 910,496,212 pesos, or an excess of 64,822,486 pesos of liabilities over assets, after adding to the former the operating profits of 1925. The liability figures place the capital of these railways at 595,538,113 pesos, an arbitrary figure. However, as they are state owned, no amortization or interest charges are assessed

against them. Several liabilities, particularly foreign loans, are long-term obligations.

No large additions were made to the state railway system during 1925-26, but the government continued work on the railway line running from Pedegua to Petorca and from Iarrain-Alcalde to Pichilemu. It has also announced its intention soon to undertake construction of a line from San Clemente to Mariposas. Although bids were called for rolling stock to equip and place in operation the Iquique-Pintados railway, which was completed during 1925, budget difficulties prevented a definite decision by the government. Private railway lines proceeded with normal improvement but did not undertake large new construction programmes. Permission was sought by American interests which purchased the line of railway running from Tocopilla to Coya Norte to extend this line to Chuquicamata, a distance of 108 kilometers. It is planned to electrify this line from Tocopilla to the Station Central as soon as permission to proceed with the extension has been granted.

Serious damage was caused during the late part of September to railroads and telegraphic communications in Chile by snow storms of unprecedented severity. The Transandine route and the Longitudinal of Chile suffered complete interruption of service in the Andean region, and the line between Valparaiso and Santiago de Chile operated under great difficulty.

**GOVERNMENT.** According to the constitution which came into force on Oct. 18, 1925, legislative power is vested in the National Congress, consisting of the senate and chamber of deputies, both of which are elected by direct popular vote. The executive power is vested in the president who is elected for six years, and who is not eligible to succeed himself. The president is assisted by a cabinet, which is responsible to him, and the members of which may speak in congress but may not vote. President at the beginning of 1926, Emiliano Figueroa (assumed office Dec. 23, 1925).

**HISTORY.** For a discussion of the Tacna-Arica dispute consult the article on **ARBITRATION, INTERNATIONAL**. During the early part of the year the Chileans were in an almost continual state of unrest. The resignation of President Alessandri (see preceding **YEAR BOOK**) and the failure of the Tacna-Arica mediation on the part of the United States caused considerable upheaval of political stability. The Chilean parliament began its sessions on May 22 but accomplished very little in the way of constructive legislation. President Figueroa stated in his message that Chile was peaceful and orderly throughout the entire country.

In November the military party practically compelled the resignation of the entire cabinet. Señor Ibañez, the Minister of War and leader of the military group, was compelled to resign also by the other members of the cabinet refusing to get out of office unless he did also. He resigned individually while the other members resigned in a body. On November 21 a new cabinet was formed, in which Señor Ibañez was again made Minister of War. The new ministry was made up as follows: Premier and Minister of the Interior, Manuel Rivas-Vicuna; Foreign Affairs, Jorge Mattegormaz; Justice and Education, Alvaro Santa María; Finance, Alberto Edwards; Agriculture, Arturo Alemparte; War, Gen. Carlos Ibañez; Marine, Admiral Arturo

Swett; Public Works, Commerce, and Communications, Julio Velasco.

**CHINA.** A Far Eastern State forming the eastern part of Asia, on the Pacific Ocean, under a republican form of government after Feb. 2, 1912.

**AREA AND POPULATION.** China comprises 18 provinces, the so-called dominion of Sinkiang, the dependencies of Manchuria, Fengtien, Kirin, and Heilungkiang, and the regions over which only nominal authority exists, viz., Mongolia and Tibet. According to estimates made in 1912 the total area is 3,913,560 square miles, though more recent estimates have placed it as high as 4,227,170; population, estimated at that time at about 325,000,000; but later estimates greatly exceed this figure. For example, the total based on estimates of the Chinese Maritime Customs in 1924 was given at 444,653,000, with 19,290,000 additional for Manchuria. In the same year the Chinese Post Office estimated the total population of China and the outer territories at 436,094,953. The tendency among authorities is to give far greater credence to the lower estimates of the 1912 year, and in some quarters it is claimed that in the past ten years the population has increased little if at all.

There are similar divergences in the estimates of the population of the cities. According to the government estimate of 1921, the population of Peking and its suburbs was about 1,300,000. Another estimate places it at 924,334, including 4000 foreigners. The estimates for the chief Chinese ports in 1924 given out by the Chinese Maritime Customs were as follows: Shanghai, 1,500,000; Hankow, 1,646,800; Canton, 900,000; Hangchow, 340,200; Changsha, 535,800; and Soochow, 500,000. The total number of foreigners and foreign residents in China in 1924 according to the Chinese Customs authorities was 320,829, of whom 198,206 were Japanese; Russians, 85,766; British, 14,701; Americans, 8817; Portuguese, 3657; German, 2733; and French, 2715. The treaty powers in China down to the beginning of 1926 were as follows: Russia, Great Britain, United States, France, Norway, Sweden, Denmark, Netherlands, Spain, Belgium, Italy, Peru, Brazil, Portugal, Japan, Mexico, Chile, Switzerland, Bolivia, Persia, and Japan. Of these powers, Germany, Bolivia, Persia, and Chile have renounced the consular power.

**EDUCATION AND RELIGION.** There are two kinds of primary schools in China, the higher and the lower. The former are established by district governments and are intended as intermediate schools between the lower primary schools, and the middle schools. In 1923 the total number was 10,236 with 582,579 pupils. In the same year there were 167,076 lower primary schools with 5,814,375 pupils in 1923. At the beginning of 1926 there were 10 government universities. Tsing Hua College, a special institution, was establishing near Peking, to prepare students for education in the United States, under the agreement on the part of the United States to return the Boxer indemnity for that purpose. There is a modern university for Chinese under British direction at Hongkong which is attended by students from many parts of China.

There are three forms of native religion, Confucianism, Buddhism, and Taoism. Besides these three there are Mohammedans in all the provinces, whose numbers have been estimated at

5,000,000 to 10,000,000. Roman Catholicism at the end of 1923 maintained 57 bishops, 1481 European priests, 1071 native priests, and the native Roman Catholics numbered 2,208,800. The Protestant missions in 1920 had 6636 engaged in their service and the Chinese Protestants numbered 618,601.

**PRODUCTION.** The following account of agricultural conditions in China is derived from the United States Department of Foreign and Domestic Commerce. After stumbling along by himself for centuries the Chinese farmer is at last to find help; or, rather, he is being put in a position to help himself. The China International Famine Relief Commission has instituted a system of rural coöperative credits among China's farmers, and the movement was reported in 1926 to be making remarkable headway. The tools of the Chinese farmer have been like those of the Chinese craftsman, the primitive implements of his ancestors. He has never had the money to equip himself with anything else. From prehistoric ages he has been the victim of the rapacious and the predatory—brigands, usurers, military tax gatherers—those who acquire gain by craft or force rather than by production. Unbelievably poor, and helpless to improve his condition, the farmer has never been able to produce more than enough for the immediate indispensable use of his family. When floods or drought overtook him his first recourse was to pawn his few personal effects. The farm equipment was pledged next, and, finally, his small piece of ground. For the money lender's loan he has had to pay, in all times past, an exceedingly high rate of interest—usually 36 per cent per annum. Generally he has had to borrow again to meet his interest obligations, and in the case of renewals he has had to pay a still higher rate. It is no matter for surprise that in recent years the tendency has been for the small landowner to be replaced by the tenant farmer, the land itself thus passing into the control of great landholding lords, much to the detriment of China's population and its productive capacity.

The rural coöperative system inaugurated by the Relief Commission is designed to relieve this situation by making it possible for the small landowner to obtain the funds required for increasing his productive capacity at reasonable rates of interest. Briefly stated, the plan has been to form local coöperative societies throughout the country of the type worked out by Raffelsen in Germany after the famine of 1846-47. Every society may have not less than 12 members, each of whom must subscribe to one share of stock in the organization and accept unlimited liability for all obligations incurred by the society. Loans are then advanced to the society by the relief commission, the security being the combined credit of all the society's members. The society in turn loans from these funds to each of its members according to his needs. Loans can be made only to members, the total advances to each society and to its individual members being limited by charter.

The coöperative credit loans are advanced for a period of one year instead of the three-month term usually set by Chinese local or professional money lenders. The rate of interest is 6 per cent on moneys loaned by the relief commission to the society, but the societies are permitted to charge their members a maximum of 12 per cent.

This is one-third or less, of the rate charged by the money lenders, but it insures a profit to the societies and allows them to acquire a working capital of their own in addition to the funds advanced by the commission. With careful management, in the course of a few years the societies are thus enabled and are expected to become independent of the funds from the relief commission. The advantages to the Chinese farmer from this system are obvious; he pays but one-third the usurers' rate, he does not have to pledge his clothes and tools as collateral, he is debtor only to his friends or neighbors who are with him in the project, and he shares in the profits made by the society.

Among the principal crops of China are wheat, barley, corn, millet, and other cereals, peas, beans, rice, sugar, indigo, cotton, silk, tea, and a great variety of fruits. For the development of industrial enterprises in China for the past decade consult the paragraph on *Production* in the article CHINA in the preceding YEAR BOOK.

**COMMERCE.** The foreign trade of China during 1925, measured in gold values, recorded a slight decline in imports and a material increase in exports as compared with the previous year, with a resultant decline in the unfavorable balance. Import values totaled \$808,091,000 in 1925 as compared with \$841,673,000 in 1924; exports reached \$649,822,000 in 1925 against \$625,145,000 in the earlier year.

The share of the leading foreign countries in the export and import trade of China is shown in the following table:

CHINA'S FOREIGN TRADE BY COUNTRIES

<i>Countries</i>	<i>1924 Per cent</i>	<i>1925 Per cent</i>
<i>Gross imports from</i>		
Japan . . . . .	23	31
Hongkong . . . . .	23	18
United States . . . . .	18	15
Great Britain . . . . .	12	10
India . . . . .	4	5
Netherlands East Indies . . . . .	2	4
Germany . . . . .	4	3
Other . . . . .	14	14
<b>Total . . . . .</b>	<b>100</b>	<b>100</b>
<i>Gross exports to</i>		
Japan . . . . .	26	24
United States . . . . .	13	18
Hongkong . . . . .	22	15
France . . . . .	6	8
Russia . . . . .	6	6
Great Britain . . . . .	6	6
China . . . . .	4	4
Germany . . . . .	2	2
Other . . . . .	15	17
<b>Total . . . . .</b>	<b>100</b>	<b>100</b>

Declared exports from China to the United States during 1925 totaled \$159,502,913, compared with \$129,133,386 in 1924 and \$176,965,503 in 1923. These totals represent the combined returns for all American consulates in China. The increase in 1925 is remarkable in view of the numerous serious obstacles to trade during the period, and is an excellent illustration of the vitality of China's trade. The bulk of the increase in 1925 was due to raw silk, wool, egg products, furs, wool carpets, intestines, antimony, goat and kid skins, shelled peanuts, and bean oil. The only important declines were in wood oil, straw braids, laces and embroideries, hair nets, and peanut oil. The accompanying table

lists the value of the more important commodities in the 1924 and 1925 trade:

DECLARED EXPORTS FROM CHINA TO THE UNITED STATES

Items	1924	1925
Frozen egg products .....	\$54,180	\$839,674
Dry egg albumen .....	2,386,933	3,409,202
Dry egg yolk .....	779,602	1,482,548
Furs, dressed and undressed, "all other" ..	6,337,233	10,595,204
Goat and kid skins .....	2,996,615	4,770,704
Intestines, etc. ....	2,784,023	4,921,803
Fur skins .....	1,236,866	1,153,735
Shelled peanuts .....	2,552,663	3,152,158
Shelled walnuts .....	479,398	801,207
Bean oil .....	808,402	1,590,340
Tea .....	1,796,682	2,561,013
Wood oil .....	12,010,691	11,715,999
Peanut oil .....	2,216,900	1,288,800
Raw cotton .....	4,037,475	4,429,268
Wool carpets .....	4,430,960	4,903,883
Sheep wool .....	12,913,826	16,010,798
Raw silk .....	25,753,237	38,371,441
Wild silk .....	2,474,237	3,692,886
Waste silk .....	2,816,668	4,210,460
Cotton laces and embroideries .....	3,305,266	2,826,936
Straw braids .....	1,602,464	469,082
Hair nets .....	1,650,964	1,029,469
Antimony, regulus .....	600,801	2,344,458
Gold bars .....	3,844,238	100,171
All other .....	29,263,562	32,831,674
Total .....	\$129,138,386	\$159,502,913

FINANCE. The Chinese Maritime Customs, originally established to insure collections on an equitable basis of import and export duties on foreign goods, and salt administration are the principal revenue-producing agencies of the Peking government. The customs service is supervised by foreign officers under the direction of an inspector general. The Maritime Customs took over the administration of native customs within 15 miles of treaty ports. For the year 1925 revenue from these two sources amounted, respectively, to approximately \$58,477,000 and \$3,972,400. The 1925 collections were the largest in the history of the Maritime Customs administration; but the increase over the preceding year was not as great as in previous years, due chiefly to the disturbed conditions in China during 1925. Against the customs revenue, estimated at approximately \$48,353,000 for 1926, there was being charged the service of the Russo-French loan of 1895, the Anglo-German loans of 1896 and 1898, and the Boxer Indemnity payments, the reorganization loan of 1913, and a number of domestic loans. After payment of administrative expenses, all foreign loan and indemnity obligations, including the reorganization loan, were met in full.

In addition to the revenues discussed, the Chinese government receives certain income from wine and tobacco taxes, stamp taxes, and the Peking octroi. Returns from these sources were not available for 1925, but estimates based on previous years indicated that their yield may have been around 4,500,000 silver dollars. The total revenue of the Chinese government thus approximates 200,000,000 silver dollars. The amount actually left for the administrative expenses of the government, however—after deducting sums retained by provincial and military authorities through whom these funds pass, the amounts required for the service of various external and internal loans, and various subsidies and grants to military commanders—is, according to an estimate made by the Chinese Government Commission for the Readjustment of

Finance, not more than 7,000,000 dollars annually.

The unsettled conditions in China make it impossible to state the actual expenditure of the government. The commission mentioned estimated the annual administrative requirement (excluding debt service) of the Peking government, under normal conditions and with a unified country, at 197,545,000 silver dollars. M. Padoux, adviser to the Chinese government, on the other hand, in a study made in September, 1925, concluded that the government could be operated on 2,620,000 dollars a month for administrative expenditures and 1,380,000 dollars for military expenditures, or 48,000,000 dollars a year; but his estimate does not include self-supporting ministries and organs, the expenses of which are deducted from receipts. During 1926 the problem of providing additional revenue for the Chinese government, and of consolidating the unsecured and inadequately secured debt, was under discussion in the customs conference which convened under the provisions of the Washington nine-power treaty, which provided for increasing the Chinese tariff.

COMMUNICATIONS. During 1924, 180,382 vessels of 141,432,827 tons entered and cleared Chinese ports. At the end of 1923 there were over 7513 miles of railway in China, excluding 1857 miles in Manchuria. Chinese railway operations in 1925 as in 1924, were extremely limited and the revenue derived was accordingly small; in the majority of instances the railways were unable even to earn their operating expenses. Transportation by rail was badly disorganized, much rolling stock has been destroyed or has suffered from depreciation, and a number of the railroads have deteriorated to the point where they are unsafe for passenger traffic and can give no service in moving freight. Few locomotives and little rolling stock of any description was sold in China during 1925. Although during early 1926 there was active inquiry for rolling stock of all descriptions, particularly for North China, the renewal of the Civil War deferred the placing of orders. Practically nothing was done toward extending the railway lines during 1925. Certain railways, such as the Lung-Hai and the Tsinan-Kaichow, which prior to 1925 were practically free from military control, have been taken over by the military parties controlling the districts through which these lines run. In South China the only event worthy of comment was the case of the Yunnan-Kopi Railway, which purchased additional locomotives and rolling stock during the year. The northern section of the Canton-Hankow line, although operating, was said to be in very bad repair as regards both track and rolling stock; the southern section of the lines was operating only spasmodically and was said to be short of rolling stock.

GOVERNMENT. At the beginning of 1926, China was virtually without a constitution. One was promulgated on Oct. 10, 1923, to replace the provisional constitution of Mar. 11, 1924. On Oct. 23, 1924, a coup d'état was carried out by Marshal Feng and on November 24 a provisional administration with autocratic powers was formed by Marshal Tuan Chi-jui. In October, 1925, elections were held to determine the form of government and the constitution. The presidency was vacant at the beginning of the year,

the chief executive being Tuan Chi-jui, installed Nov. 24, 1924. The cabinet, appointed at the same time, was constructed as follows: Interior, Kung Sing-Chau; Foreign Affairs, Tang Shao-Yi; Agriculture and Commerce, Yang Shi-Kan; Education, Wang Chu-Lin; Communications, Yeh Kung-Cho; War, Wu Kuan-Sing; Navy, Liu Chien-Chang; Justice, Chan Shih-Chow; Finance, Li Sze-Hao.

### HISTORY

THE PEKING GOVERNMENT. China's history during the year was a struggle for supremacy between the north and the south, the former under the leadership of the Manchurian warlord, Chang Tso-lin, and the latter under the leadership of the follower of Dr. Sun Yat Sen, Chiang Kai-shek. Generally speaking the fortunes of Chiang Kai-shek and his Cantonese followers were in the ascendancy at the close of the year, and it did seem, although prophecies concerning China's future are generally futile, as though he and his Kuomintang Party would be the unifying force that would lead China out of the meshes of a disastrous fratricidal war into the ranks of modern nationhood. All through the various struggles going on in China there was an attempt on the part of some of the leaders to keep at least a form of central government at Peking. Needless to say the term "central government" is used in a very loose sense because the Peking government never even claimed to exercise jurisdiction over the whole of China, much as it would like to.

As the year opened, Tuan Chi-jui, the provisional president, remained in office, although his position was considerably weakened. In the premiership Hsu Shih-ying was to be found aided by the following members of the cabinet: Foreign Affairs, C. T. Wang; Interior, Yu Yujen; Finance, Chen Chin-tao; War, Chia Te-yao; Navy, Tu Hsi-Kui; Justice, Ma Chun-wu; Education, Yi Pei-chi; Agriculture and Commerce, Kou Hsia; Communications, Kung Hsin-chan. The cabinet construction showed the increasing importance of the Kuomintang Party in Peking affairs. The Peking government precipitated an international crisis in the middle of March when it fortified the Taku forts at the mouth of the Pei River, and prevented commerce on the stream in either direction. Great Britain, the United States, France, Italy and Japan, the Boxer signatories, protested and compelled the Peking government completely to reverse its position. This untoward event considerably weakened the position of President Tuan. Early in March he made an offer to General Feng to enter the cabinet, but it was refused because his position was being made untenable by the Manchurian leader, General Chang, who entered the ancient capital of the country on April 15. Five days previously President Tuan had been deposed. Feng, the military power behind Tuan was forced to flee to Mongolia and for the time being was eliminated as a factor in the North China situation.

Wu Pei-fu, who had been defeated by Chang in 1924, but had been his ally in the move to oust Tuan from Peking, now became the ruler of the Peking district with the backing of Chang. He appointed General Wang Muan-ching sole ruler of the city. Feng was pursued into Mongolia by Chang but the latter was unable to annihilate Wu as he had promised and

Feng continued to be a menace from his Mongolian fastness.

The Peking cabinet established under Wu's régime after the middle of April consisted of: Prime Minister, W. W. Yen; Foreign Affairs, Alfred Sze; Finance, V. K. Wellington Koo; Commerce, Yang Wen-kai; Interior, Cheng Chien; War, Cheng Ching-huai; Education, Wang Ching-juei; Justice, Chang Kuo-Kan; Communications, Chang Chi-tang. The premier was the only member of this cabinet in Peking and he acted as a virtual dictator under the auspices of the army. The form of government brought about a dispute between Chang and Wu. The latter favored a government formed by constitutional processes, while the former wished a government based upon the army. The Chang and Wu forces appeared to have only one thing in common, namely opposition to the Bolsheviks, who openly favored the cause of the southern or Cantonese leader, Chiang Kai-shek.

Dr. Yen, the premier, resigned his position on June 22, announcing that he felt he had been made a catspaw by the ambitions of Chang and Wu. After a few months rule under the premiership of Admiral Tai Hsi-kwei, V. K. Wellington Koo was named acting prime minister on October 1. He had formerly held the posts of Minister to Great Britain and the United States. While considered one of the big men of China he seemed doomed to failure as a "strong man" as the year drew to a close, because he was not closely allied with any of the leading military chieftains.

THE CIVIL WAR. It is virtually impossible to give a chronological account of the civil war happenings in China, because they are not associated with any two single groups fighting against each other, but revolve rather around the personality of four or five of the military leaders who had more or less firmly established themselves in different parts of the country. An attempt will be made to present a short sketch of each of the prominent leaders during 1926 and after a résumé of the chief facts in his career, a brief discussion of the situation as it affected foreigners will be given.

The outstanding figure at the end of the year was Chiang Kai-shek, the warlord of the south, the leader of the Cantonese group of the Kuomintang Party, and the natural successor to the leadership of this group of Dr. Sun Yat Sen. Chiang undoubtedly was under the influence of the Moscow government and from this point of view was probably the most unfriendly toward the foreign element in China. If successful in gaining complete control over China it was expected that he would urge strenuously the revision of all foreign treaties and would adopt the slogan of "China for the Chinese." By the end of the year he had captured Wuchang and Hankow and had made himself complete master of the Yangtze Valley. As the year closed his only rival of any importance in the field was Chang up in Manchuria. His successes had practically eliminated General Wu for the time being.

Chiang's successes in the south were several times on the verge of causing foreign complications, and it must be said that the governments of Great Britain and Japan withheld direct intervention in the face of severe and many provocations. In September severe clashes occurred between members of General Wu's army

and sailors and marines from British war vessels in the upper Yangtse. The British press both in China and at home demanded vigorous action and direct intervention, but the government stated that such incidents were the result of the chaotic conditions in China and could not be considered a valid reason for intervening. From time to time American warships, as well as Japanese and French were fired upon, marines were landed to protect property, but the year closed without serious attempts being made to subdue China by outside interference. By the end of the year Chiang held control of the provinces of Kwangtung, Kwangsi, Hunan, Kweichow, Hupeh, Kiangsi, and part of Honan. General Feng, who had been defeated by Chang, was friendly to Chiang and held Mongolia and part of Shensi.

On November 21, Chiang made a statement of what the Kuomintang (The People's Party) represented. He stated that the revolution would not end until extraterritorial rights and concessions and unequal treaties had all been abolished. The powers who are willing to abrogate all former treaties and return their concessions and offer recognition to China on the basis of equal parties, will show a friendly spirit toward and be recognized by China. Recognition of the other powers which are unwilling to take this action was not considered essential to China, and such recognition was not wanted. Imperialism in whatever form it presented itself was to be attacked. This strong spirit of nationalism seemed to be able to gather the dissenting groups into a closer relationship.

The one bitter opponent of Chiang at the close of the year was Chang in Manchuria. At the close of the year, however, he was somewhat overshadowed by the star of Sun Chuanfang, who was in control of the five central provinces of China with his headquarters at Nanking. He was an able leader and seemed capable of assuming the duty of reuniting China, but he hesitated too long, and when he threw in his lot with Wu and Chang against Chiang, the Cantonese had gained too much momentum and overwhelmingly defeated him, and caused his star to set as the year drew to a close.

Wu-Pei-fu and Feng Yu-hsiang lost considerable ground during the year although Wu was of some prominence at the beginning of the year when he was in control of Peking with Feng. Feng was defeated by Chang and his new ally, but former enemy, Wu, and retired to Mongolia where he supported the position of Chiang in Canton. Wu was a bitter enemy of Chiang and came to blows with him on the upper Yangtse but was defeated and at the close of the year was virtually without an army or support of any kind. Feng went to Moscow and after remaining in consultation there for several months returned to Mongolia in the autumn and prepared to join hands with Chiang in an attack on Sun and Chang, which, if successful, would give them complete control of all China.

**ATTITUDE TOWARD FOREIGNERS.** Throughout the entire year there were many demonstrations against foreigners. The press in many foreign countries attempted to prove that this was the result of machinations on the part of Soviet Russia. Whatever the cause, the movement was very popular and appeared to have the hearty endorsement of the missionaries, who felt that their religious work was being hampered by

the commercial and industrial intrigues of the foreign countries without any regard for the feelings of the Chinese in the matter. Strikes, boycotts, and riots followed each other in rapid order and the Chinese were wily enough only to affront one nation at a time. Thus the big strike at Shanghai in 1925 was aimed against Great Britain. As a result of it Japan and France prospered and did not seem to mind the situation at all. Later on the Japanese were hit much to the advancement of all the other countries interested. Then it was the turn of France and so on. In this way the Chinese prevented the foreign nations from joining in any unified protest or taking joint action against the various means taken to disturb the "foreign devils."

**TARIFF CONFERENCE.** The Washington Conference proposed an international conference to discuss the problem of China's internal and external tariff duties. The conference began its sittings and investigations in 1925 and on July 23, 1926 was compelled to adjourn sine die without accomplishing anything of value chiefly because of the chaotic condition and the failure of any group of Chinese representatives to actually represent China. When the conference first met in October, 1925, the foreign nations announced that they were ready to give up any claim to regulating China's tariff and would grant tariff autonomy. Needless to say such an announcement was hailed in the Chinese press, but was bitterly attacked abroad, particularly in the press of Japan and Great Britain. There was a feeling in certain quarters of the American press, that the representatives of Japan and Great Britain were partially instrumental in wrecking the tariff conference largely because of the fact that it would serve their interests much better to keep the status quo than to give China tariff autonomy. Whatever the cause, the conferences ended in July and never functioned thereafter.

**THE COMMISSION OF EXTRATERRITORIALITY.** The Washington Conference also suggested an investigation of the conditions of extraterritoriality in China, that is, those treaty provisions, etc., which practically nullified Chinese sovereignty and substituted the laws of the country making the treaty. Some countries, such as the United States, Great Britain, and Japan, had suggested early in the twentieth century that they would be glad to abolish extraterritoriality provisions as soon as China showed herself able to substitute satisfactory guarantees for them. Civil wars and revolutions prevented China from so doing but she suggested at the Washington Conference that the matter be taken up by an international commission and made a subject of thorough study. As mentioned above these extraterritoriality provisions were anathema to the Cantonese war lord, Chiang and his followers.

On November 28, the report of the commission was published. The commission had held 21 full sessions between January 12 and Sept. 16, 1926, and in the meantime had made as thorough an examination of the practice of extraterritoriality jurisdiction in China as possible, and had also studied the laws, judicial system, and methods of judicial procedure in China. The commission comprised representatives of the following countries: United States, Belgium, Great Britain, China, France, Denmark, Italy, Japan, Holland, Norway, Portugal, Sweden, and Spain.

Briefly summarized the commission found serious fault with the methods of conducting the extraterritoriality courts, because of the various matter handled, the lack of legal experience or training in most cases, inability to appeal decisions, and the variety of laws applied to similar cases when affecting different nationals. The suggestion was made that Chinese law codes be substituted as soon as possible if these extraterritorial courts are to continue to function. The result of the study of the Chinese legal system brought out the facts that most of the current codes were not passed by the proper constitutional authorities and therefore did not have a binding effect and that they were liable to be overthrown at almost any moment by a conquering war lord who was executive, legislative, and judicial rolled into one. Furthermore there were far too few courts and prisons to handle all the cases presented. Finally, the commission advocated the gradual abolition of the extraterritorial courts, province by province, as conditions warranted, and as constitutional and legal codes were rightfully established.

**ABROGATION OF THE TREATY WITH BELGIUM.** An event of the utmost importance occurred on November 16, when the Chinese government at Peking abrogated the Sino-Belgian Treaty of 1865. China took this step after Belgium had refused to negotiate a new treaty on the basis of equality and reciprocity. The step was important because in a way it foreshadowed a possible precedent in the handling of all foreign treaties when the expiration term arrived.

**BRITISH MEMORANDUM.** On Christmas Day the British Foreign Office published a note on Chinese policy, which had been presented to the Peking government on December 18. The note advocated the virtual recognition of the Cantonese government and the abolition of foreign control. Great Britain expressed her willingness to negotiate new treaties with China and to permit the abolition of extraterritoriality control, as well as the immediate levy of the Washington Conference surtaxes for the benefit of China. At the same time the British government released for publication a note sent to the United States government in May advocating the relaxation of foreign control in China. The publication of the note was adversely received in Japan and in France, which appeared to back the claims of Japan even to the extent of antagonizing Great Britain. The Cantonese leaders in the few days left of the year seemed to be suspicious of the British proposals and looked upon them as being a disguised form of British imperialism.

**CHITA.** See FAR EASTERN REPUBLIC.

**CHORAL SOCIETIES.** See MUSIC.

**CHOSEN.** See KOREA.

**CHRISTIAN CHURCH.** A church originating in three religious movements, that of the Rev. James O'Kelly of Virginia, who, in 1792, opposed Methodist Bishops, and those of the New England Baptist, Abner Jones, who organized a separate church in 1801, and of the Kentucky group, formed in 1804. These groups eventually united, all holding that minor points of belief should be subordinated to Christian brotherhood. A General Convention meets every four years, and convened at Urbana, Ill., in October, 1926. Biennial conventions are held in districts, each consisting of a number of States. The church carries on home and foreign mis-

sions, educational work, publication, Evangelism, Christian unity work, social service, and other general activities. Its home mission field includes new Americans in the East, the lumber camps in Washington, Indians, mountaineers, and negroes; its foreign field, Japan, Porto Rico, and South America. It maintains eight educational institutions. Its publishing house at Dayton, Ohio, issues, among other periodicals, the oldest religious newspaper in the United States, the *Herald of Gospel Liberty*. In 1926 the Christian Church had 1147 churches, 1123 ministers, and 108,261 members. It had a total revenue of \$1,024,379. Its Sunday schools, numbering 946, had 98,723 pupils.

**CHRISTIAN ENDEAVOR, UNITED SOCIETY OF.** An international, inter-racial, and inter-denominational movement for young people which was founded in 1881 for the purpose of training converts for church membership and work. It meets biennially, and in 1925 convened for its 30th Convention at Portland, Ore., July 4-9. A World's Christian Endeavor Convention was held in London, England, July 16-21, 1926, bringing together delegates from more than 40 nations, including Australia, India, and the new countries in Europe. An International Convention was to take place in Cleveland, Ohio, July 2-7, 1927. Four departments carry on the activities of the society: Junior, Intermediate, and Young People's Societies, and Alumni Councils. Statistics for 1926 showed 81,903 societies, of which 47,420 were in the United States, 4090 in Canada, and 34,483 in other countries. During the fiscal year ending July 1, 1926, 2682 societies enrolled. For 1926 the enrollment in the various groups of the society was: Comrades of the Quiet Hour, whose members covenant to spend a definite portion of each day in prayer, 245,415; the Tenth Legion, whose members make the tenth their minimum gift for religious work, 72,357; and Life-Work Recruits, young people who have agreed to give themselves to full-time service in the Christian ministry or in missionary work, 8253. The Alumni Department of the society, established in 1919, is composed of former Endeavorers and friends of Endeavor. In each two-year period between the biennial conventions, a special campaign is undertaken. The campaign in 1925-27 was the Loyalty Campaign, with the slogan, "Personal Acceptance of, and Allegiance to Jesus Christ." During the year progress was made in every land and societies were reported as having been organized in such places as the wilds of Brazil and the Faroe Islands. Of the denominations, the Presbyterians led in the number of societies in America, the Methodists in Great Britain, and the Lutherans in Germany and Northern Europe. *The Christian Endeavor World* (weekly) is the official publication of the Society. Officers for 1925-27 were: President Emeritus, Rev. Francis E. Clark; President, Rev. Daniel A. Poling; Vice-Presidents, Howard B. Grose and William Hiram Foulkes; Clerk, Clarence C. Hamilton; Treasurer, A. J. Shartle; General Secretary, Edward P. Gates. Headquarters of the Society are at Mount Vernon and Joy Streets, Boston, Mass.

**CHRISTIAN SCIENCE.** A system of metaphysical or spiritual healing discovered by Mrs. Mary Baker Eddy in 1866. The first church was established by Mrs. Eddy in Boston in 1879 and given a charter by the Commonwealth of Massa-

chusetts. In 1892 it was reorganized as a voluntary religious association known as The First Church of Christ, Scientist, in Boston, called more frequently by its adherents "The Mother Church." Mrs. Eddy wrote the textbook of the movement, *Science and Health with Key to the Scriptures*, published in 1875. The Sunday services of the church are conducted by a first and second reader, the first reading from the textbook, and the second from the authorized version of the Bible. In 1926 there were over 8052 practitioners of Christian Science in the United States and other countries, who devoted their entire time to healing the sick through prayer. A Board of Directors administers the affairs of The Mother Church. Its annual meeting was held in Boston, June 7. Reports indicated expenditures totaling \$1,192,091.47 from the General Fund of the Church during the year, and \$265,961.42 from the Permanent Special Funds. During the fiscal year ending May 31, 13 churches and 76 Christian Science societies, including three university societies, were recognized as branches of The Mother Church; 21 new organizations were located in Europe, 5 in Africa, 1 in Australia, 3 in New Zealand, and 1 in the Dutch East Indies. The total number of recognized branches, including 28 college and university societies, was 2253. Three departments conduct the principal activities of the movement: The Board of Education, Board of Lectureship, and Committee on Publication. The educational board instructs and authorizes students to teach Christian Science. The Board of Lectureship consists of 24 members who deliver free lectures on Christian Science throughout the world. During the year 3432 lectures were delivered, of which 3123 were in the United States and Canada, and 309 in foreign fields. The Committee on Publication aims to correct impositions on the public in regard to Christian Science. It also endeavors to guard the rights of Christian Scientists against restriction by public authority. The Christian Science Publishing Society, which publishes and issues the authorized literature of The Mother Church, operates under a deed of trust granted by Mrs. Eddy; its affairs are now administered by a Board of Trustees according to the Manual of the church. The Publishing Society issues the daily paper of the movement, *The Christian Science Monitor*; other periodicals of the Scientists include: *The Christian Science Journal*, *Christian Science Sentinel*, *Der Herold der Christian Science*, and *Le Héraut de Christian Science*. The Benevolent Association of the church conducts a sanatorium, where 1742 guests were provided for during the year. A training course is also conducted for nurses. The headquarters of the church are at 206 Massachusetts Avenue, Boston. David Newton McKee was president of The Mother Church for the year ending May 31, 1926.

**CHRISTIANS.** See DISCIPLES OF CHRIST.

**CHRISTMAS ISLAND.** An island belonging to Great Britain, in the Indian Ocean, lying 190 miles southwest of Java, annexed to the Straits Settlements in 1889. Area, 62 square miles; population, estimated in 1924, 995. Christmas Island is important because of its very large deposits of phosphate of lime which constitute its only export. Exports in 1924 amounted to £232,791 and imports to £50,155. The chief imports are tools, machinery, railway materials,

and lorries. For administrative purposes the island is connected with the settlement of Singapore.

Christmas Island is also the name of the largest atoll in the Pacific Ocean. It belongs to the British colony of Gilbert and Ellice Islands.

**CIEPLAK, tsé'plak, JOHN.** Roman Catholic Titular Archbishop of Acrida, and Metropolitan of Vilna, Poland, died at Passaic, N. J., while on a visit to the United States, February 17. He was born at Dombrova in Poland in 1858, and came into general public attention during the early years of the Soviet government in Russia, when he acted in charge of the affairs of the Roman Catholic Church in the absence of its primate. In March, 1922, he and a number of priests were accused of acting in opposition to the Soviet policies in regard to religion, and of concealing church treasures from the Soviet authorities. After a Soviet trial, Archbishop Cieplak and Mgr. Butkevitch were condemned to death by the Supreme Revolutionary Tribunal in Moscow. This action brought protests from many western churches and governments, and though Mgr. Butkevitch was executed, the sentence of death for the Archbishop was commuted to ten years solitary confinement. In the following year he was released and expelled from Russia, taking up his activities in Poland.

**CIGARS AND CIGARETTES.** See TOBACCO.

**CINCINNATI, UNIVERSITY OF.** A coeducational, municipal institution of higher education at Cincinnati, Ohio; founded in 1870. The registration in the autumn of 1926 was 7492, distributed as follows: graduate school, 192; liberal arts, 1207; evening courses in liberal arts, 815; education, 766; engineering and commerce, 1293; evening commerce courses, 2383; applied arts, 226; household administration, 64; law, 115; social work, 61; medicine, 270; nursing and health, 100. For the summer school the enrollment was 1744. There were 502 members on the faculty. The endowment funds of the University for the fiscal year 1925 were \$5,971,234.47, and income for the same period \$1,449,667.42. The library contained 126,761 bound volumes and 40,000 pamphlets. President, Frederick Charles Hicks, Ph.D.

**CITY MANAGER PLAN.** See MUNICIPAL GOVERNMENT.

**CITY PLANNING.** The most significant event in the city planning field during the year was the decision of the United States Supreme Court in the *Euclid, Ohio*, case, noted at some length below, upholding in general all the fundamental principles of zoning as a constitutional

exercise of the police power and sustaining in particular the zoning principle as applied by the Euclid ordinance to the exclusion of buildings devoted to business from residential districts. The number of local planning agencies in the United States now exceeds 300, according to "A Planning Review" by Flavel Shurtleff, secretary, National Conference on City Planning (see *Proceedings*, 1926). Of 49 cities having a population of 150,000 or more, 44 have planning boards. Mr. Shurtleff's paper contains a list of 141 cities for which more or less complete city plans have been made. There is not available an up-to-date summary of the extent to which plans made by these or other cities have been carried out, but it is well known that many of them have not gone far beyond the paper stage, although much has been done in some cities, both small and large. Acting according to recent congressional authorization, President Coolidge, on May 19, appointed the National Capital Park and Planning Commission to develop a comprehensive plan for the national capital and its environs and to develop parks and parkways. Of 11 members of the commission, seven are officials of the Federal and District of Columbia governments. The other four members, appointed to serve for 6, 5, 4 and 3-year terms respectively, are Frederick L. Olmsted, landscape architect, Brookline, Mass.; Frederic A. Delano, chairman, Committee on Regional Plan of New York and Environs; J. C. Nichols, city planning expert, Kansas City; and Milton R. Medary, Jr., president, American Institute of Architects. It was expected that the committee would continue the notable work done some years ago by an earlier commission in the way of planning, extending it, however, to the district surrounding Washington and taking up parks and parkways.

On June 14, Mayor Walker of New York City appointed a Committee on City Planning and Survey, consisting of 471 men and women in various walks of life, including leading members of various branches of the city government and of technical, civic and labor organizations. The chairman of this committee was Morgan J. O'Brien, a former justice of the New York State Supreme Court, and its secretary was Joseph A. Warren, commissioner of accounts of the City of New York. The following seven sub-committees were created: (1) Housing, Zoning and Distribution of Population; (2) Street and Terminal Facilities; (3) Traffic Regulation and Street Uses; (4) Sanitation and Harbor Pollution; (5) Highways and Bridges; (6) Parks and Recreational Facilities; (7) New Sources of Revenue.

As an example of the city planning work constantly in progress throughout the country and as illustrating its complex character for large cities and the time which it requires, it may be noted that during the year the City Planning and Zoning Commission of New Orleans put under way studies for a comprehensive plan for development of that city, entrusting the work to a city planning consultant with the understanding that the studies would be completed within four years. Reports were to be presented on: (1) A major street plan; (2) transit; (3) rail and water transportation; (4) parks, boulevards, playgrounds; (5) zoning; (6) regional plans for highways, transportation, recreational areas, and general uses of property.

**STREET WIDENING AND EXTENSIONS.** The continuously enlarging traffic problem in many cities which had grown haphazard rather than had been laid out on any adequate systematic plan, was resulting in a large amount of street widening and extension all over the country. Some of this was being done in accordance with major street plans and some was merely the result of local intensive pressure. In Boston and vicinity, according to a summary prepared by the Division of Metropolitan Planning, the total estimated cost of street widening and extension work undertaken in the past five years by either the City of Boston or the Metropolitan District Commission amounted to some \$20,000,000. Some of this work was well under way and some had not yet extended beyond preliminary stages. Eight projects in hand by the City of Boston were to cost some \$20,000,000 and six projects undertaken by the Metropolitan District, about \$8,000,000. Of the latter, the northern traffic artery was to cost \$2,400,000; the southern artery, \$1,800,000; and the Old Colony Parkway, \$2,500,000. The legislature of 1926 took no action on the proposed intermediate thoroughfare loop highway for the relief of downtown Boston, recommended two or three years ago at an estimated cost of \$30,000,000.

At Washington, D. C., a piece of current work was the widening of Connecticut Ave., 30 feet by taking 15 feet off each 40-foot sidewalk. At Baltimore, Md., since the annexation of about 60 square miles of territory in 1918, the local City Plan Commission worked out a major street plan and put 57½ miles of street work under way, providing mostly for streets between 80 and 150 feet wide. Of this amount, 12.8 miles had already been completed early in 1926. Besides the 57½ miles of major streets, condemnation proceedings had been started on 84 miles of minor streets which would fit into a general plan. Detroit was making progress with its major street plan, including also some super-highway work for Detroit and vicinity with street widths of over 200 feet.

At Chicago, the Wacker Drive was opened for traffic on October 21. This is over a mile in length and is a two-story structure designed to separate traffic (for elements of design and construction see *Engineering News-Record*, October 15 and 22, 1925, pp. 632 and 662). The cost of this work, excluding land damages, was about \$10,000,000. The Wacker Drive, together with a somewhat similar double-deck concrete structure on South Water St. and improvements on Canal St., Roosevelt Road and Michigan Ave., complete the quadrangle around the congested business district of Chicago, so that traffic can skirt the district instead of passing through it. In Chicago, also, over half of the work of widening Western Ave., through its distance of 23 miles from north to south boundary lines of the city, has been completed. This avenue leads into the Dixie Highway.

A summary of progress on the major street plan of St. Louis up to April, 1926, showed that of some 250 miles, 135 miles were of satisfactory width at the outset. Of the remaining 115 miles (recommended for widening or extension) about 10 miles have been constructed, nearly 50 miles are under ordinance, and 25 have been recommended by the City Plan Commission to the Board of Public Service for action, while on 35 miles no action has yet been taken.

**REGIONAL PLANNING.** A dozen regional planning associations, mostly voluntary in character rather than in any sense branches of government, were in existence in 1926 in the United States. Arranged geographically by city locations, these are as follows: Niagara Frontier Planning Association (offices at Tonawanda, near Buffalo); Committee on Regional Plan of New York and Environs, New York City; Regional Planning Federation of the Philadelphia Tri-State District, Philadelphia; Lucas County Planning Commission, Toledo, Ohio; Detroit Rapid Transit Commission, Detroit, Mich.; Chicago Regional Planning Association, Chicago, Ill.; Madison-St. Clair Counties Regional Planning Association, East St. Louis, Ill.; Twin City Metropolitan District, Minneapolis-St. Paul; Kansas City, Mo. (committee being formed for five counties—Clay, Jackson, Johnson, Platte, and Wyandotte); Los Angeles County Regional Planning Commission, Los Angeles, Cal.; Regional Planning Association of San Francisco Bay Counties, San Francisco, Cal.

**ZONING.** The latest available summary of zoning progress, compiled by the Division of Building and Housing of the U. S. Department of Commerce (dated April, 1926), listed 436 municipalities with a population exceeding 27,500,000 with zoning ordinances in effect. There were only 6 such cities in 1916, 73 at the end of 1921, 265 in 1923, and 425 at the end of 1925. At the date of the compilation, New Jersey headed the list with 73 cities and New York followed with 72, California with 47, Massachusetts with 41, and Illinois with 38. The latest revised list may be obtained by applying to the Department of Commerce, Washington, D. C., as also a summary of zoning decisions, entitled *Zoning and the Court*, by Edward M. Bassett; a *Zoning Primer* by the Advisory Committee on Zoning appointed by Secretary Hoover, and *A Standard Zoning Enabling Act*, by the same committee. The same department also issues *A City Planning Primer*.

**THE EUCLID ZONING DECISION.** The United States Supreme Court decision upholding zoning, mentioned above, was handed down on November 22, three judges dissenting. (*Village of Euclid, Ohio, v. Ambler Realty Co.* on appeal from Federal District Court for Northern Ohio.) The original plaintiff in this case, owner of 58 acres of undeveloped land, sought to have the entire zoning ordinance of the village, as adopted in 1922, set aside as a violation of Sec. 1 of the 14th Amendment of the Federal Constitution in that the ordinance would deprive the owners of the land of liberty and property without due process of law. The owner of the land also maintained, and the trial Supreme Court agreed, that enforcement of the ordinance would reduce materially the selling value of the land in question. In the course of its decision, the Supreme Court took it for granted that zoning ordinance restrictions on the height of buildings and on the exclusion of nuisance-producing industries from certain areas have already been established as constitutional. It, therefore, concerned itself chiefly with the exclusion of buildings for business purposes from areas restricted by ordinance to residence purposes. Speaking of nuisances in general, the Supreme Court said that "a nuisance may be merely a right thing in the wrong place—like a pig in the parlor, instead of the barnyard." Elsewhere in its decision the

court held in effect that apartment houses in districts restricted to single-family or two-family dwellings would be a nuisance because out of place. The Supreme Court decision referred to the three leading state Supreme Court decisions—New Jersey, Maryland and Texas—adverse to zoning and more than offset this by mentioning State Supreme Court decisions in nine states upholding zoning, these states being Massachusetts, Rhode Island, New York, Louisiana, Illinois, Wisconsin, Minnesota, Kansas, and California. Summarizing state decisions upholding zoning, and giving its approval thereto, the Supreme Court said: "The decisions enumerated in the first group cited above agree that the exclusion of buildings devoted to business, trade, etc., from residential districts bears a rational relation to the health and safety of the community. Some of the grounds for this conclusion are: Promotion of the health and security from injury of children and others by separating dwelling houses from territory devoted to trade and industry; suppression and prevention of disorder; facilitating the extinguishment of fires and the enforcement of street traffic regulations and other general welfare ordinances; aiding the health and safety of the community by excluding from residential areas the confusion and danger of fire, contagion and disorder which in greater or less degree attach to the location of stores, shops and factories. Another ground is that the construction and repair of streets may be rendered easier and less expensive by confining the greater part of the heavy traffic to the streets where business is carried on." Finally, the court made it clear that its decision in this case was on broad, general grounds, and did not at all bar consideration of special conditions that might be brought up in other cases.

**RESTORATION OF ROME.** The restoration of the grandeur of Rome to make it again as "vast, well ordered and powerful as in the days of the Emperor Augustus" was officially begun on April 21 under an order issued by the Italian Premier, Mussolini. The work is under the charge of Senator Cremonesi, "the first Governor of Rome" under another of Mussolini's orders. The National Government has advanced 90,000,000 lire for the work. Among other improvements proposed are two main thoroughfares, one between the Trajan and Roman Forums and the other leading to the Coliseum.

New books in this field are James, *Land Planning in the United States for the City, State and Nation* (New York); and Kehr, *A Nation Plan: A Basis for Coordinated Physical Development of the United States of America, with a Suggestion for a World Plan*.

**CIVIC FEDERATION, NATIONAL.** See NATIONAL CIVIC FEDERATION.

**CIVIL ENGINEERS, AMERICAN SOCIETY OF.** An association of professional engineers founded in 1852 to advance engineering and architectural knowledge and practice, maintain high professional standards, and encourage intercourse between men of practical science. It is made up of: Members, including civil, military, naval, mining, mechanical, electrical, and other engineers in active practice ten years and qualified to design as well as direct engineering work; Associate Members, those who have been practicing five years; Affiliates, persons qualified to cooperate with engineers, but not themselves engineers; Juniors, beginners in the profession;

Fellows, contributors to the permanent funds who are not eligible to membership, and Honorary Members, persons of acknowledged eminence in engineering. Four general meetings are held each year: The annual meeting held the third week in January, in New York, at which the results of a previous ballot for officers are announced, reports of committees are received, and other business transacted; the annual convention held during the summer, with general business, technical sessions, and interesting excursions; and the spring and fall meetings. In addition, there are monthly meetings in New York City, as well as meetings held by the local sections.

In 1926 there were 45 local sections, and 86 affiliated student chapters in colleges throughout the country. The membership, as of Nov. 16, 1926, was 11,820, divided as follows: Honorary members, 14; members, 5186; associate members, 5425; juniors, 1037; affiliates, 150; fellows, 8. The annual meeting was held on January 19-21; and the spring meeting, Kansas City, Mo., April 14-16, was devoted to transportation. The summer meeting in Seattle, Wash., July 14-16, considered logging and lumbering industries; while the annual convention in Philadelphia, October 4-9, discussed 150 years of civil engineering. At these meetings nine technical divisions presented papers and carried on independent committee work. Seventeen special committees, enlisting 100 members, followed out investigations during the year. Eighty-five members of the Society served on joint committees and boards with representatives of other societies, for research and standardization. The Society publishes monthly *Proceedings*, containing the papers presented at meetings, with discussions and items of general interest. At the end of each year the papers and discussions are republished in the annual volume of *Transactions*. It also issues an annual Year Book. The officers for 1926 were: President, George S. Davison; Vice-Presidents, Richard L. Humphrey, Milo S. Ketchum, Allen Hazen, Walter L. Huber; Secretary, George T. Seabury; Treasurer, Otis E. Hovey. The headquarters of the Society are in the Engineering Societies Building at 33 West 39th Street, New York, of which, with three other national engineering societies, it is joint owner as well as of the engineering library here installed.

**CIVIL SERVICE AND PERSONNEL PROBLEMS.** Unquestionably the outstanding event of the year in this field was the decision of the U. S. Supreme Court with regard to the right of the President of the United States to remove from office those who had been appointed by him by and with the advice and consent of the Senate. In the case of *Myers vs. the United States*, by a vote of 6 to 3, in an opinion rendered by Chief Justice Taft, the Court sustained the right of the President so to remove. According to Chief Justice Taft, the power to prevent the removal of an officer who has actually served is quite different from the authority granted by the Constitution to the Senate to consent to or reject an appointment: "When a nomination is made, it may be presumed that the Senate is, or may become, as well advised as to the fitness of the nominee as the President, but in the nature of things the defects in ability or intelligence or loyalty in the administration of the laws of one who has served as an officer under the President are facts

as to which the President or his trusted subordinates must be better informed than the Senate, and the power to remove him may, therefore, be regarded as confined, for very sound and practical reasons, to the governmental authority which has administrative control. The power of removal is incident to the power of appointment, and when the grant of the executive power is enforced by the express mandate to take care that the laws be faithfully executed, it emphasizes the necessity for including within the executive power as conferred the exclusive power of removal." The fact that the Constitution places no express limit on the power of removal by the Executive is taken by the Supreme Court majority as "a convincing indication that none was intended." Chief Justice Taft, therefore, says "we must hold that the provision of the law of 1876, by which the unrestricted power of removal of the first-class postmasters is denied to the President, is in violation of the Constitution and invalid." Justices Brandeis, Holmes and McReynolds dissented.

Some idea of the extent of the development of the merit system in the Federal Civil Service may be gathered from President Coolidge's message of December, 1925 in which he said:

"In 1883 Congress passed the civil service act, which from a modest beginning of 14,000 employees has grown until there are now 425,000 in the classified service. This has removed the clerical force of the Nation from the wasteful effects of the spoils system and made it more stable and efficient. The time has come to consider classifying all postmasters, collectors of customs, collectors of internal revenue, and prohibition agents by an act covering in those at present in office, except when otherwise provided by Executive order. The necessary statistics are now being gathered to form the basis of a valuation of the civil service retirement fund based on current conditions of the service. It is confidently expected that this valuation will be completed in time to be made available to the Congress during the present session. It will afford definite knowledge of existing and future liabilities under the present law and determination of liabilities under any proposed change in the present law. We should have this information before creating further obligations for retirement annuities which will become liabilities to be met in the future from the money of the taxpayer."

In the year, June 30, 1925, to June 30, 1926, the number of Federal employees was reduced from 564,718 to 560,705.

Progress in the extension and development of the merit system of appointment is measured not only by the number of positions withdrawn from the spoils system but also by the increased efficiency and economy it produces in the administration of the service. There has been an improvement in methods of ascertaining fitness by psychological tests, and in the moral support of the government by intelligent public opinion. There is no question that the Federal Civil Service Commission has grown in public favor and general acceptance.

Due to the increased and increasing technical activities of the Government and the new legislative requirements, the Commission is called upon to hold a large number of technical, professional, and scientific examinations. Among the new interesting activities supplied by these

examinations are the commercial air service; the public building programme involving the expenditure of \$165,000,000 and requiring draftsmen, engineers, and architects; pharmacists in the prohibition service; probation officers in the United States courts; experts in coöperative marketing; auditors, actuaries, attorneys and examiners in the Income Tax work and in the Interstate Commerce Commission.

There are three national organizations giving detailed attention to the application and extension of the merit system: the National Civil Service Reform League (see CIVIL SERVICE REFORM LEAGUE, NATIONAL) the Assembly of Civil Service Commissions and the Public Personnel Bureau. The League is the oldest. It is essentially propagandist and critical and is entitled to the fullest measure of credit for the persistence, public spirit and effectiveness with which it has applied itself to what at best is a thankless task. During 1926 it devoted much of its energies to combating the corrupt practices incident to the purchase and sale of Federal offices, particularly in the Southern states. They have been exposed quite clearly by the League, which was able to capitalize the general feeling of disgust. In the House and the Senate, bills are pending which, if they became law, are intended to stamp out the possibility of the purchase and sale of Federal offices through political organizations. One was introduced by Mr. Wurzbach (Republican) of Texas, the other by Mr. Stevenson (Democrat) of South Carolina. Both were passed and went to a conference committee, but the committee did not report them before adjournment, and consequently they were not finally passed. It was expected that the would be passed and signed when Congress reconvened.

The League aimed to get the conference committee to provide specifically that it shall be the function and duty of the Federal Commission to enforce the provisions of the bills. The League was also gradually building up popular support for legislation to bring into the classified civil service presidential postmasters and the tax collection forces of the Treasury Department. The hold on these offices by the political organizations is so strong, however, that it may take a number of years to secure action. The headquarters of the League are at 8 West 40th Street, New York City.

The Bureau of Public Personnel Administration devotes itself to the development of the technical features of the problems. Its principal activity during 1926 was the development of tests intended to select qualified persons to fill ten classes of positions common in the public service: Playground supervisor, road inspector, plumber, shift engineman, junior clerk, private branch exchange operator, electrician, patrolman, senior account clerk, and probation officer. The tests for junior clerk and patrolmen have been almost completely standardized; both have been widely used, those for junior clerk in industry as well as in the public service. The staff of the Bureau handled the detailed work of preparing a comprehensive statement regarding the merit system in the public service and drafted a law embodying the best present day practices for the Conference Committee on the Merit System. The headquarters of the Bureau are in the Mills Building, Washington, D. C.

During the year arrangements were made with the Assembly of Civil Service Commissions and

with individual civil service commissions in the United States and Canada (the bodies for which the Bureau serves as a clearing house and research agency) by which they provide a part of the financial support hitherto contributed almost entirely by interested public citizens. The Assembly brings together the actual administrators of the various Federal, state and municipal Civil Service laws. Through its coöperation with the League and Bureau it is gradually developing its efficiency and effectiveness.

Perhaps the most important single development was the completion of the *Report of the Conference Committee on the Merit System*, which consisted of representatives of the Assembly of Civil Service Commissions, the National Civil Service Reform League, the Governmental Research Conference, and the Bureau of Public Personnel Administration, the National Municipal League. This was believed to be the most authoritative statement so far prepared with regard to such matters as the size of the public service, the problems involved in public personnel administration, the functions and organizations of a public personnel agency, and the results that ought to be achieved. The report includes a draft of a proposed law or charter embodying advanced ideas as to proper legal provisions.

This Committee was formed "for the purpose of preparing a definite, clear-cut statement of the functions a public personnel agency should exercise, and of the results which should be secured when it is properly supported and exercises these functions." The Report recognizes that there is room for difference of opinion on how the employment functions should be distributed among the three important official bodies concerned with employment affairs, i.e., the civil service commission, the executive heads of departments, and the legislative body. It, however, outlines a number of functions in which the civil service commission should at least participate. The more important are the classification of positions; establishment of standard rates of pay; selection of employees for entrance to the service and for promotion; certification of eligible persons for appointments; regulation of transfers; rating of the efficiency of employees; and regulation of the removal of employees."

To what extent the commission should exercise each of these functions is discussed in detail. The moot problems how the personnel agency should be constituted is considered at length, but no definite answer is given. Six forms of organization are described and the advantages and disadvantages of each are listed. These forms are (1) an appointed bi-partisan commission (2) an appointed part-time commission with a full-time expert who is by statute the executive officer of the commission; (3) an appointed bi-partisan commission with one full-time member and two associate part-time members (4) an appointed commission consisting of one person; (5) a commission consisting of one person chosen by competitive test; and a commission with an active, full-time executive member chosen by competitive test and two part-time associate members, one appointed from among the operating officials and the other chosen by the employees.

**CIVIL SERVICE REFORM LEAGUE, NATIONAL.** An organization founded in 1881 for the purpose of putting to an end the so-called spoils

system of making appointments to public office. It has sought to accomplish this end by promoting administrative efficiency through the application of the merit system to the appointment, promotion and tenure of government employees. The League is made up of local associations in various parts of the country and of individual members not in local groups.

During 1926 the League sponsored legislation to empower the President to place in the classified civil service all Federal positions exempt by statute; to provide for the appointment of all postmasters and rural carriers through the merit system and without political recommendation; to place prohibition agents in the classified civil service; and to abolish the Federal Personnel Classification Board, transferring its functions to the United States Civil Service Commission, in order that the administration of personnel matters might be handled by one agency. The League protested against the sale of postmasterhips and other positions in the postal service in Southern States and urged the President to issue an executive order making mandatory the appointment of the first person on eligible lists for these positions. It made an investigation of the appointment of deputy collectors of internal revenue and found that the number of deputy collectorships was increasing rapidly because they were being used as political patronage. Legislation empowering the President to place these positions in the classified service was supported by the League. The League was represented by two members on the Conference Committee on the Merit System which included representatives from the National Municipal League, Government Research Conference, National Assembly of Civil Service Commissioners, and the Bureau of Public Personnel Administration. This committee issued a report on the functions which a public personnel agency should exercise and the results which should be secured when it is properly supported and exercises that function. Through its Field Division the League endeavors to secure the adoption of civil service laws in various states and cities. Reports of its investigations are issued from time to time. *Good Government* is the official organ of the League. The officers in 1926 were: President, Thomas W. Swan; treasurer, A. S. Frissell; secretary, Harry W. Marsh. The headquarters of the League are at 8 West 40th Street, New York City.

**CIVITAN CLUBS.** Organizations composed of selected professional and business men, who have dedicated themselves to unselfish service to their city, State or Province, and nation. The first Civitan Club was organized in the spring of 1917 at Birmingham, Ala. The word "Civitan," coined by one of its founders, means "the citizen." It was not until 1920 that Civitan spread beyond Birmingham, but in the summer of 1921, when the first convention was held, there were thirty clubs, all of them except Washington and Baltimore in the Southeastern and Southwestern States. When the sixth annual convention met in Philadelphia, Pa., in December, 1926, the National Association numbered 192 clubs, with nearly 8000 members, new clubs having been organized during the year in Alabama, Florida, Maine, Connecticut, Massachusetts, Maryland, North Carolina, Ohio, West Virginia, Tennessee, and Texas. The outstanding accomplishment of this convention was the adoption of a programme

to stamp out tuberculosis and curb crime. Among the activities of the individual clubs were: The care of crippled children, the erection of municipal golf courses, public parks and play grounds, street paving, road building, sanitation, essays on "Good Citizenship" by public school students, better schools, securing new industries, erection of tuberculosis hospitals, care of under-privileged children, and Boy Scout camps. The national officers for 1926 were: President, Dr. Herbert Acuff, Knoxville, Tenn.; first vice-president, Sanford Hyams, San Francisco; second vice-president, Seymour Stewart, St. Louis; third vice-president, James N. MacLean, New York; secretary, Neal B. Spahr, Knoxville, Tenn.; treasurer, Claude L. Hagan, Birmingham, Ala.; field secretaries, Charles F. Lender, Columbus, Ohio, Ben M. Russell, New Haven, Conn., Edwin L. Turrell, San Francisco, Calif. The official publication is *The Civitan*, a monthly, published at Columbus, Ohio, Frank H. Ward, Editor. Headquarters are in the First National Bank Building, Birmingham, Ala., and the secretary's office is 1115-16 General Building, Knoxville, Tenn.

**CLARK, CHARLES HOPKINS.** American newspaper editor, died at Hartford, Conn., September 5. He was born at Hartford, Conn., Apr. 1, 1848, and after graduating from Yale in 1871, he became connected with the *Hartford Courant*, a connection maintained throughout his entire life until his death, when he was its editor. He advanced through various positions working under Gen. Joseph R. Hawley and Charles Dudley Warner, the associate editors, succeeding to the political writing of General Hawley when he became United States Senator, and the general responsibility for the paper after Mr. Warner's death in 1900. He introduced many features into this paper, the oldest newspaper to be continuously published in America, and gradually broadened its field, introducing in 1913 the Sunday edition which became very popular. He developed the policy of cooperative ownership of the publishing company's stock, sharing with his co-workers in the benefits and profits. He was actively interested in Republican politics, serving regularly as a delegate-at-large from Connecticut to the Republican National Conventions. In 1906-07 he was lecturer at Yale University of the Isaac H. Bromley Lectureship Foundation, discussing journalism as a profession and a public service.

In addition to his newspaper work Mr. Clark had many interests in Hartford, being a director of the Connecticut Mutual Life Insurance Company, of the Travelers Insurance Company, of the Phoenix (Fire) Insurance Company, and of the Collins Company. In 1910 he was a director of the Associated Press and served on its executive committee for many years. He was a member of the Connecticut State Constitutional Convention in 1902, and a director of the State Reformatory in 1909. He was also a member of the board of directors of the Connecticut Civil Service Reform Association, but he gradually lost his active interest in this movement and resigned from the organization, later advocating the repeal of the Connecticut Civil Service law, which was done in 1921. He was a director of the Hartford Public Library, of the Good Will Club, of the Connecticut Humane Society, and of the Hartford Retreat. From 1910-25 he was a fellow of the corporation of Yale University, and was also a trustee of the Wadsworth Athenaeum and the

Watkinson Library in Hartford. In 1910 he received the degree of L.H.D. from Trinity College, Hartford. He was well acquainted with several presidents of the United States and declined high public office from President Taft. He was at the time of his death one of the leading newspaper editors and publishers of the United States and his passing called forth many expressions of appreciation from other newspaper workers and public men generally.

**CLARK UNIVERSITY.** A non-sectarian university comprising a college for men and a co-educational graduate division of arts and sciences. The registration for the autumn of 1926 was 324, including 235 undergraduates, 65 graduate students, and 55 special students. The enrollment for the summer session was 214. There were 40 members in the faculty. Four professors, Jesse L. Bullock, assistant professor of chemistry, W. Elmer Ekblaw, associate professor of geography, Vernon A. Jones, associate professor of educational psychology, and Arthur F. Lucas, assistant professor of economics, and three instructors were added during the year. Leland L. Atwood, assistant professor of romance languages, and Dudley W. Willard, assistant professor of sociology, were appointed to fill vacant chairs. The productive funds amounted to approximately \$5,000,000. The library contained 105,000 volumes. President, Wallace W. Atwood, Ph.D. The university is situated at Worcester, Mass.

**CLASSIC ANTIQUITIES.** See ARCHÆOL-OGY.

**CLASSICAL PHILOLOGY.** See PHILOLOGY, CLASSICAL.

**CLAY.** In 1926 the production of china clay, ball clay, and other white grades in the United States continued in good volume and almost 500,000 short tons were shipped from American mines during the year. In addition, there was imported somewhat over 400,000 short tons, and the lower grades of imported clay were coming into direct competition with the American product, particularly as, while the lower grades could be sold cheaper in the United States, the higher grades which did not compete with the American products were sold at a higher price. During the year there was discovered in Texas a white clay that fuses to glass at 2100 degrees F, being a clay with the firing behavior of feldspar, but highly viscous when melted. There was an increased tendency during the year to ship clay in bulk in paper-lined cars, from which

it was unloaded by air suction to elevated tanks. During the year there was an increase in South Carolina production and there was an effort being made to increase the production of North Carolina grades and to standardize the product. The U. S. Bureau of Mines reported the clay sold by producers in the United States to amount to 4,030,420 short tons and to have a total value of \$12,736,632. This was distributed as follows: Kaolin or china clay and paper clay, 367,319 short tons, valued at \$3,220,719; ball clay, 109,607 tons, valued at \$699,427; slip clay, 7349 tons, valued at \$37,397; fire clay, 2,566,934 tons, valued at \$7,312,349; stoneware clay, 77,438 tons, valued at \$162,161; miscellaneous clay, which includes brick clay and that used in the manufacture of building and drainage materials, also for cosmetics, filtering oil, flower pots, insecticides, modeling, soap filler, softening water, taxidermy, and other purposes, 4,030,420 tons, valued at \$12,736,632. The American clay mining industry in 1925 increased nine per cent over that for 1924 and the sales of clay were the largest ever recorded, being 11 per cent greater than in 1924 and 221 per cent greater than in 1915. Domestic clays were being used in the higher grades of ceramic production, in the paper industry for coating and filler, and for other fillers, in artificial abrasives as a binder, and for other purposes.

The Department of Commerce announced that, according to data collected at the census of manufactures taken in 1926, the establishments engaged primarily in the manufacture of clay products and non-clay refractories reported, for 1925, a total output valued at \$447,670,009, an increase of 2.7 per cent as compared with \$436,064,290 for 1924, but a decrease of three-tenths of 1 per cent as compared with \$448,834,938 for 1923.

The value of clay products and non-clay refractories for 1925 is made up as follows: Brick, tile, and other clay products except pottery, \$314,976,773; pottery, \$112,018,500; non-clay refractories, \$20,684,431. The percentages of increase or decrease which these values represent as compared with the corresponding figures for 1924 are, respectively, 5.0 per cent,—5.1 per cent and 12.9 per cent.

The census statistics for 1925 are presented in the accompanying table though they are preliminary and subject to correction, as may be found necessary upon further examination of the returns.

CLAY PRODUCTS AND NONCLAY REFRACTORIES—NUMBER OF ESTABLISHMENTS AND VALUE OF PRODUCTS FOR THE UNITED STATES: 1925, 1924, AND 1923

	1925	1924	1923	Per cent of increase (+) or decrease (—) 1924—1923— 1925 1924

**COAL.** The coal strike in Great Britain was naturally the most important incident in the world's coal industry during the year, and its effects were felt not only in Great Britain itself, but also in Europe and in the United States. With the greatly decreased production from Britain the output of other countries was stimulated and in the United States in particular the production all but equaled that of the best years previously.

**UNITED STATES COAL PRODUCTION.** The United States coal production in 1926 as estimated by the Bureau of Mines for both bituminous and anthracite is given in the accompanying table which shows the output by months and daily averages.

ESTIMATED MONTHLY AND AVERAGE DAILY PRODUCTION OF COAL IN THE UNITED STATES, 1926  
[Net tons]

	Bituminous		Anthracite	
	Month	Daily average	Month	Daily average
January	53,662,000	2,121,000	173,000	7,000
February	46,577,000	1,949,000	2,083,000	87,000
March	46,137,000	1,709,000	8,790,000	326,000
April	40,079,000	1,559,000	8,217,000	329,000
May	39,059,000	1,538,000	8,054,000	322,000
June	41,992,000	1,615,000	8,937,000	344,000
July	43,472,000	1,672,000	8,427,000	324,000
August	46,352,000	1,783,000	8,226,000	316,000
September	48,976,000	1,959,000	8,444,000	338,000
October	54,592,000	2,100,000	8,675,000	347,000
November	59,721,000	2,398,000	7,446,000	310,000
December	57,671,000	2,218,000	7,528,000	290,000
Total for year	578,290,000	1,880,000	85,000,000	280,000

The total production of bituminous coal in the United States during the calendar year of 1926 was estimated by the United States Bureau of Mines in its preliminary statistics at 578,290,000 net tons. The final reports from the operators would change this figure somewhat, but probably not more than 2 per cent. For the year 1925 the Bureau's preliminary estimate was 522,967,000 tons. The final complete reports from the operators showed 520,052,741 tons, or an error in the preliminary estimates of six-tenths of 1 per cent. The following tabulation gives the production of bituminous coal in the United States for the years specified, the figures for 1926 being the estimates referred to above, and those from 1918 to 1925 are the final figures on production as reported by the operators.

ESTIMATED UNITED STATES PRODUCTION OF BITUMINOUS COAL  
[Net tons]

Period	Production	Average per working day
Calendar year:		
1918	579,386,000	1,881,000
1920	568,667,000	1,847,000
1923	564,565,000	1,845,000
1924	483,687,000	1,573,000
1925	520,053,000	1,692,000
1926	578,290,000	1,880,000

PRODUCTION OF SOFT COAL BY STATES—1925  
[Net tons]

	Total
Alabama	20,004,000
Arkansas	1,220,000
Colorado	10,811,000
Illinois	66,909,000

PRODUCTION OF SOFT COAL BY STATES—1925—Continued

	Total
Indiana	21,225,000
Iowa	4,715,000
Kansas	4,524,000

Wyoming	6,553,000
Other States*	241,000
Total bituminous production	520,053,000

\* Includes Alaska, California, Georgia, Idaho, North Carolina, Oregon, and South Dakota.

The 1926 production of bituminous coal in the United States (578,290,000 tons) was more than 9,000,000 tons above the 1920 production (568,666,683 short tons) which stood as the peace-time record in the industry, and was almost exactly equal to the record output of the year 1918 (579,385,820 short tons). The reasons for this increase were several. In the first place, the anthracite strike, which was four months old at the beginning of the year, continued for another month and a half, so that the increased demand for bituminous coal was felt for several weeks further. As a result, the output of bituminous for the first four months of 1926 was 226,000,000 tons, as compared with 198,000,000 and 204,000,000 tons for the corresponding periods of 1924 and 1925. The most important factor, as stated, was the British strike, which began May 1 and is discussed elsewhere in the YEAR BOOK under GREAT BRITAIN, section *History*.

As distinct from the anthracite strike in Pennsylvania, the British struggle had an effect in world markets, developing a demand for American coal to be exported, and this was done to such a degree that the exports and production continued at a high rate until the end of the year. The production for the four months, September to December, inclusive, was nearly 224,000,000 tons, as compared with 179,000,000 tons for the same period in 1924 and 202,000,000 tons in 1925, during the anthracite strike. The year 1926 in the American industry also was marked by new records for weekly and monthly production, the maximum for a week being that ending December 4, when 14,676,000 tons were produced, as compared with the previous record of 13,344,000 tons made in the week of Oct. 25, 1924. This would mean, if sustained throughout the year, an annual production of more than 765,000,000 tons. The maximum month's production was in November, when the output was 59,721,000 tons, which may be compared with October, 1919, when 57,200,000 tons were produced. Notwithstanding the increased production there was a decline in the amount of labor involved, and from 704,793 employees in 1923 there was a reduction to 588,493 in 1925, or 16.5 per cent. The average output per man employed increased from 781 to 884 tons. The exports from

Atlantic ports in 1926 approximated 22,000,000 tons, as compared with the annual average for the previous three years of 5,000,000 tons, and this amount was estimated as slightly in excess of the previous high record of 1920. In other words, the British strike afforded the United States industry a market for some 14,000,000 tons of bituminous coal, contributing to the general prosperity of the industry.

**UNITED STATES PRODUCTION OF ANTHRACITE COAL.** The total production of anthracite coal for the calendar year 1926 was estimated at approximately 85,000,000 net tons by the United States Bureau of Mines in its preliminary statistics. This estimate showed a gain of 23,183,000 tons or 37.5 per cent when compared with 1925 when the total output amounted to 61,817,000 tons. The production was curtailed in both years by four months of strike in 1925 and two months in 1926. Compared with 1924 and 1923 the decrease in 1926 amounted to 3 per cent and 8.9 per cent respectively.

At the beginning of the year the anthracite industry was completely tied up by the strike which began on Sept. 1, 1925. According to the Anthracite Bureau of Information this was the first time in more than a century of anthracite production that mining operations were completely tied up in the middle of winter, by a strike which began on September 1 and was not terminated until February 18, of the following year. This strike not only cut off all production at a period of the year when anthracite was most needed; but it was the longest one in anthracite history, the elapsed time having amounted to 170 days.

It was estimated that during the five and one-half months the mines were idle the loss to the mine workers in wages was not less than, and probably exceeded, \$150,000,000. The out-of-pocket expense to the operators in the maintenance of the properties was approximately \$35,000,000, and if the loss of possible profits was included, the industry was probably between \$45,000,000 and \$50,000,000 to the had as compared with what it would have been had the mines remained active. The losses to the business interests in the region were enormous, consumers of anthracite were seriously inconvenienced and forced to the adoption of substitutes for their customary and preferred fuel, the families of the mine workers suffered many privations, and the miners gained nothing as the result of the strike.

The anthracite miners returned to work at the previously existing wage scales and under an agreement extending to Aug. 31, 1930, which embodied the principle of arbitration, in that:

At any time after January 1, 1927, but not oftener than once in any year, either party may, in writing, propose modifications in the wage scales of said contract. The parties agree within fifteen days after receipt of such written proposals, to start conferences in the usual manner in an effort to agree upon such modifications.

If within thirty days after starting such negotiations, the parties have not agreed, all issues in controversy shall be referred to a Board of two men with full power and without reservations or restrictions; and the parties agree to abide by any decision or decisions of such Board, either on the merits of the controversy or as to procedure to be followed. Such Board shall be appointed as follows:

The Operators shall name three men and the Miners shall name three men. The Operators shall select one man from the Miners' list and the Miners shall select one man from the Operators' list, and the two men so approved shall constitute said Board. Unless otherwise agreed, the men named by the parties shall not be con-

nected with the United Mine Workers of America or the business of mining coal. The Board shall be obligated, within 90 days after appointment, to arrive at a decision on all issues in controversy, and to that end shall formulate their own rules and methods of procedure and may enlarge the Board to an odd number, in which event a majority vote shall be binding.

The resumption of work was followed by general activity and steady production which was maintained throughout the year. The actual working time lost to the anthracite mine workers from January 1 to February 18, was 39 days, and the loss in production was in the neighborhood of 10,000,000 gross tons. Much was accomplished, however, in the making up for lost time after operations were resumed. Work was unusually active during the summer months of 1926, and up to the end of November half of the lost tonnage was made up, the total production for the first eleven months of 1926, according to the United States Bureau of Mines, amounting in round numbers to 68,650,000 gross tons, as compared with 73,527,000 tons for the same period in 1924, a year of normal production, and exceeding that of 1925, by over 12,000,000 tons. With an average production for December, the total output of anthracite for the year 1926, will have amounted to about 76,700,000 gross tons. The production during the previous five normal years was as follows, the strike years 1922 and 1925 being excluded:

Year	Total production Gross tons
1919.....	78,501,931
1920.....	79,998,437
1921.....	80,779,867
1923.....	83,338,401
1924.....	78,506,127

Excluding the abnormal war years of 1917 and 1918, and the subnormal strike years of 1922 and 1925, the average annual production of anthracite since and including 1911, has amounted in round numbers to 79,790,000 gross tons, and including the abnormal and subnormal years, the average annual production since 1911, a period of fifteen years, was 76,832,000 gross tons, a figure which the output in 1926 closely approximates.

Except for extraordinary rains which resulted in the flooding of many mines and consequently in reduced tonnages in the early part of November, the production in 1926 would closely have approached the larger average.

According to the Anthracite Bureau of Information the somewhat unusually large production in the summer months of 1926 moved quite freely without the incentive of "spring and summer discounts" from the mines to the dealers' yards and from them to the bins of consumers, so that comparatively small quantities of the domestic sizes were placed in storage in that usually dull season. The experience of the winter of 1925-26 not having been entirely forgotten, consumers able and willing to provide in advance against their winter needs, did so, and the arrival of winter weather early in December found most of the larger users prepared for it. So well, indeed, had provision been made that demand for anthracite in the closing month of the year was lighter than at any time after operations were resumed in February.

As indicative of the manner in which the production was distributed, the reports of the

American Railway Association show that the shipments of anthracite through the New England gateways up to the end of November, 1926, amounted to 152,230 cars, as compared with 126,569 cars for the same period in 1925 and 148,453 cars in 1924. The exports to Canada to the end of October, 1926, as reported by the U. S. Bureau of Foreign and Domestic Commerce, were 2,904,297 gross tons, against 2,727,230 tons in 1925 and 3,021,555 tons in 1924. The lake shipments from Buffalo and Erie, reported by the Ore and Coal Exchange of Cleveland, amounted in 1926 to 2,551,712 gross tons, against 1,601,354 tons in 1925, and 2,814,516 tons in 1924.

The main revenue of the anthracite industry is derived from the fresh-mined commercial product, i.e., the mined tonnage shipped or sold locally, exclusive of that recovered from the old culm banks by washeries and from creek and river beds by dredges, and that portion of the mined product which is consumed in the generation of heat and power at the collieries. While figures for 1926 are not available, the following table giving the quantity and value of the fresh-mined commercial tonnage, as taken from a preliminary report issued by the United States Bureau of Mines, in the five preceding years is illuminating. It is estimated that the 10 per cent increase in the wage rate and other concessions to the miners forced upon the industry by the "Pinchot compromise" of 1923, added in excess of \$30,000,000 to the labor cost of production. In spite of that fact, however, the average value per ton at the mines in 1924 was 5 cents less than it was in 1923, and only 25 cents more than it was in 1922, while in 1925, the year of strike and shortage of supply, the average return per ton to the operators was 12.3 cents less than in 1924, 17.3 cents less than in 1923, and only 12.7 cents more than in 1922. These official figures were quoted by the anthracite operators as refutation of any charge that the anthracite producers took any advantage of the emergency of 1925 to advance prices on their product:

Year	Commercial production Gross tons	Value at mines	Average value per ton at mines
1921 . . . . .	70,191,076	\$437,488,640	\$6.233
1922 . . . . .	39,768,901	255,574,915	6.426
1923 . . . . .	71,718,088	482,404,160	6.726
1924 . . . . .	69,906,363	486,720,562	6.676
1925 . . . . .	48,805,380	319,862,247	6.553

CANADA. The Canadian coal mining industry in 1926 had an output of more than 16,100,000 tons and it was stated that its reserves included approximately 16 per cent of the world's supply. Canada was in a unique position inasmuch as its coal mines were located in the provinces of Nova Scotia and New Brunswick in the east and in Saskatchewan, Alberta, and British Columbia in the west, so that for the intermediate region imports from the United States were extensively used. The exports of Canada in 1926 amounted to 900,000 tons, while the imports from the United States totaled 17,120,000 tons, and from other countries 400,000, so that the total available for consumption amounted to 32,725,000 tons, of which 4,020,000 tons were anthracite, 24,960,000 tons bituminous, 401,000 sub-bituminous, and 3,344,000 lignite. The total consumption was estimated for the year at 28,460,000 tons. The output of the Nova Scotia mines in 1926 was

stated at 6,810,000 tons, while that of New Brunswick was 168,000 tons, or a decline from the 208,012 tons produced in 1925. The province of Alberta produced 6,117,000 tons, including 2,960,000 tons of lignite, 2,750,000 tons of bituminous coal, and 400,000 tons of sub-bituminous. Saskatchewan produced 376,000 tons of lignite, and British Columbia had an output of 2,634,000 tons of bituminous, a large part of which was exported. See CANADA.

BRITISH COAL INDUSTRY. The coal mining industry in Great Britain on account of the great strike in 1926 functioned for less than six months. From the first of May until early in December production was suspended except at a few pits in the Midlands area where a partial operation was carried on by miners returning before the strike ended. Whereas the output in 1925 had been 244,430,886 gross tons, in five months of 1926, not counting December, it amounted to 112,257,060. Naturally there was a considerable increase in bunker prices and the value of imported coal for domestic consumption which, for the strike period, aggregated 17,794,701 gross tons, reached £37,177,033, and attained an average price in November of £2 12s. 1d. per ton. One result of the strike was to extend the working day in every district, either by an hour or a half-hour, and at the end of the year it was estimated that some 575,600 miners employed before the strike would be working in districts on an eight-hour basis and 536,000 would be working in districts on a seven and one-half hour basis.

FRENCH AND BELGIAN COAL INDUSTRY. The British strike stimulated production in France and Belgium, and in both countries the output exceeded the pre-war average, in the case of France being ahead of that of 1925. With the increase in price, wages were also increased and there were also increased costs of supplies and advances in transportation rates. The total French production for 1926, based upon actual figures for the first ten months, was estimated at 52,000,000 metric tons, as compared with 48,000,000 tons in 1925 and 42,000,000 tons in 1913. In the last-named year this figure was exclusive of production from the Lorraine mines, which in 1926 produced approximately 5,400,000 tons. The imports into France declined after the British strike, but France took coal from Germany, Belgium, and Holland. On the other hand, the exports increased during the year, being 3,836,000 tons for ten months, as compared with 3,691,000 tons for a corresponding period in 1925. The French consumption for the year was estimated at 76,000,000 tons.

The Belgian coal industry also benefited by the British strike, its domestic industrial market being reestablished, and many mines which had been unable to work to capacity were actively engaged during the year. The production for ten months of 1926 was 20,652,000 metric tons, or a monthly average of 2,065,000 tons, as compared with a monthly average of 2,174,000 in 1925 and 1,903,000 in 1913. In this ten months' period Belgium imported 6,408,000 tons of coal, of which Germany supplied 3,349,000 tons. In the ten months' period Belgium exported 3,158,000 tons, as compared with 2,155,000 tons during the corresponding months of 1925, France being the largest customer. Although there was a decrease in wages at the beginning of the year, by May an increase was

## VALUES OF FOREIGN COINS

Country	Legal standard	Monetary unit	Value in terms of U. S. money	Remarks

made and increased prices of coal were secured by the producers to compensate for the higher wages. The year 1926 was, all things considered, a favorable one to the coal industry in both France and Belgium.

**COCHIN-CHINA**, kō'chin-chī'na. The southernmost colony in French Indo-China (q.v.). Area, estimated at 26,476 square miles; population, estimated in 1924 at 4,001,093, consisting chiefly of Annamites, Cambodians, Moïs, Chams, and Chinese, with a few Indians, Malays, Tagals, and foreigners. In 1924 there were 11,439 French and 654 European foreigners. Saigon, the capital, had a population in 1924 of 108,566, of whom 8444 were Europeans, exclusive of 3066 troops. Cholon had a population of 233,270, of whom 122,185 were Chinese. There are about 1134 schools with 2554 teachers and 90,070 pupils. The principal product and the largest item of export is rice, over 80 per cent of the cultivable land being given over to its production. The rice crop for 1925 was estimated at 2,215,263 metric tons, of which 1,095,441 tons were available for export. Other crops are maize, beans, rubber, sugarcane, ground-nuts, tobacco, coffee, fruits, etc. Other sources of wealth are livestock and fisheries, the annual output of the latter being placed at 2,800,000 francs. There are 11 rice mills in Saigon and Cholon which have a daily output of 3000 tons of rice. There are also in these cities two sawmills, two soap factories and a varnish factory. Commerce is largely in the hands of the Europeans and the Chinese, although the Annamites are traders on a small scale. During 1924, 749 steamers of 1,599,368 tons entered the port of Saigon and 752 vessels of 1,608,254 tons cleared. The total exports in 1924 amounted to 1,341,336,000 francs and the total imports, 818,656,983 francs. The budget for the year, 1925, balanced at 14,079,850 piastres. Cochin-China is ruled directly by a governor and council of 24 members. It is represented in the French parliament by one deputy.

**CODIFICATION**, LAW. See INTERNATIONAL LAW.

**COFFIN**, CHARLES ALBERT. American manufacturer and financier, died at Locust Valley, N. Y., July 14. He was born in Somerset County, Me., in 1844, and after graduating from the Bloomfield Academy went to Boston, where he became interested in the shoe and leather industry. As a member of the firm of Coffin & Clough he established a factory at Lynn, Mass., and in 1883 purchased the American Electric Company of New Britain, Conn., a small concern at that time headed by Prof. Elihu Thomson. This business was moved to Lynn, and its name changed to the Thomson-Houston Electric Company in honor of Professor Thomson and Prof. Edwin J. Houston who was associated with him in the enterprise. This company, of which Mr. Coffin be-

came vice-president and treasurer, developed the central station idea as applied to arc lighting, and in 1888 Mr. Coffin, who became the leader in many fields of development, brought the company into the electric railway field, manufacturing equipment for electric street car lines throughout the United States.

The success of this work led to the absorption of other electric companies, and finally in 1892 the Thomson-Houston Company was consolidated with the Edison General Electric Company of New York under the name of the General Electric Company. Mr. Coffin was elected its president and served in this capacity until June, 1913, when he was made chairman of the board of directors, retaining this office until 1922. His leadership during this long period was strong and constructive. The engineering and research work of the company received his active support, and under his control the Curtis steam turbine was developed by the company's engineers with the result that the primary power resources of the electric industry were revolutionized. In 1901, he endorsed the movement to establish a laboratory for electrochemical research, from which developed later the research laboratory of the General Electric Company.

In 1915, Mr. Coffin organized the War Relief Clearing House for France and her allies, which later was consolidated with the American Red Cross; throughout the War he was active in the work of this organization. For his activities during the World War he was honored by being made an officer of the Legion of Honor, of France; a commander at one time of the Order of Leopold II, of Belgium; and a member of the Order of Saint Sava, of Serbia. In 1922 at the time of his retirement from the board of directors of the General Electric Company that corporation established a fund of \$400,000 to be known as the Charles A. Coffin fund, the income of which was to be devoted to encouraging the study and the application of the science of electricity.

Mr. Coffin was a broad-minded industrialist, a keen financier, and an active manufacturer with a high degree of original ability, which brought the General Electric Company to preëminence in all its relations. As early as 1914 he received the degree of LL.D. from Union College in Schenectady, N. Y.; in 1919 Yale awarded him the honorary degree of M.A.; in 1922 he was given an LL.D. by Bowdoin; and in 1924 the same degree by Princeton. He was a director of the General Electric Company and many other corporations.

**COINS**, VALUES OF FOREIGN. The legal estimates of the values of foreign coins on Jan. 1, 1927, as issued by the Secretary of the Treasury are given in the table on page 184 and on this page.

**COKE**. In 1925 the coke produced in the United States was estimated at 50,702,000 tons,

as compared with 56,977,534 tons in 1923, the year of record production. Of the 1925 output 10,714,000 tons were beehive coke and 39,988,000 were by-product coke. This was the output of 74 by-product plants, 48 of which were affiliated with iron furnaces and 26 were non-furnace plants. The production of the furnace plants was 83.2 per cent of the total, as against 82.5 per cent in 1924 and 73.5 per cent in 1916. The by-products obtained from coke oven operation in 1925 had a total value of \$122,725,524, exclusive of coke breeze, which amounted to \$8,945,345. The leading productions were: Tar to the value of \$11,903,196; ammonia, \$27,513,793; gasoline, \$61,484,219; light oils and derivatives, \$21,594,357; and naphthalene, crude and refined, \$97,493. The total value of coke and by-products per ton of coke produced for the year 1925 was \$8.86, as compared with \$10.33 in 1923 and \$13.55 in 1920. Naturally Pennsylvania was the leading producer of coke, followed by Ohio,

institution of higher education at Hamilton, N. Y.; founded in 1819. In the autumn of 1926 there were 905 students enrolled, and 69 members on the faculty. The productive funds amounted to \$4,077,577.21, and the income for the year to \$386,373.13. The new recitation hall, begun in 1925, was completed, at a cost of \$400,000. The library contained 107,000 volumes. President, George Barton Cutten, Ph.D., D.D., LL.D.

**COLITIS.** ULCERATIVE. See DYSENTERY.

**COLLEGES.** See UNIVERSITIES AND COLLEGES.

**COLOMBIA.** A South American Republic in the northwestern part of the continent. Capital, Bogota.

**AREA AND POPULATION.** The area of Colombia is given at 440,846 square miles and the population according to the census of Oct. 14, 1918, 5,855,077; estimated in 1925 by the Colombia Year Book, 7,000,000. The total population was distributed as follows: Whites, 20 per cent;

NUMBER AND PRODUCTION OF BY-PRODUCT COKE PLANTS CONNECTED WITH IRON FURNACES AND OF ALL OTHER PLANTS, 1920-1925

Year	Number of active plants		Coke produced (net tons)		Percentage of production	
	Furnace plants	Other plants	Furnace plants	Other plants	Furnace plants	Other plants
1920 . . . . .	45	23	25,212,745	5,621,206	81.8	18.2
1921 . . . . .	45	22	16,231,374	3,518,206	82.2	17.8
1922 . . . . .	43	21	23,889,702	4,660,843	83.7	16.3
1923 . . . . .	44	21	31,117,323	6,480,341	82.8	17.2
1924 . . . . .	50	25	28,029,647	5,953,921	82.5	17.5
1925 . . . . .	48	26	38,208,442	6,703,717	83.2	16.8

The final returns of the by-products recovered in 1925 are tabulated below. These figures include all by-products except coke breeze, of which 3,546,099 tons, valued at \$8,945,345, were produced at by-product plants and 272,556 tons valued at \$453,012 at beehive plants.

<b>Total .....</b>	<b>7,048</b>	<b>405,934</b>

**PRODUCTION, MINERAL RESOURCES, ETC.** Agriculture and mining are the principal occupations of the country. The chief agricultural products are coffee, bananas, cacao, and hides. In the plateau region, of which Bogota, the capital, is the centre, the chief agricultural products are wheat and coffee. Only a small area

now being exploited are those at Chivor, also known as the Somondoco mines, which are reported to have an inferior grade of emerald. It is asserted that Colombia has more than 90 per cent of the world's production of emeralds.

The largest gold and silver mines in the country are at Marmato and Supia, near Manizales, which were recently taken over by the government from an English company. Many large coal deposits are known to exist, but present exploitation is entirely for supplying railroads and near-by towns. Deposits of asphalt, copper, lime, ceramic clay, mica, asbestos, graphite, and other minerals are known to exist, but have not yet been given exhaustive development. Twenty companies were reported as interested in the country's petroleum industry, three of them being domestic and the others foreign organizations. Only one company was producing at the time the above survey was made.

**COMMERCE.** The total foreign trade of Colombia for the year 1925 amounted to 170,193,089 pesos, of which 85,829,707 pesos represented imports and 84,363,382 pesos represented exports. The figures for the preceding year were: Imports, 52,347,914 pesos; exports, 85,780,541 pesos; total 138,128,455 pesos. The exports of coffee in 1925 were 1,870,431 bags valued at \$64,582,519. The following table supplied by the Pan American Union *Bulletin* shows the exports of principal articles for 1923 and 1924:

## EXPORTS BY PRINCIPAL ARTICLES

<i>Commodities</i>	<i>1923</i>		<i>1924</i>	
	<i>Quantity</i>	<i>Value</i>	<i>Quantity</i>	<i>Value</i>
Coffee .....	123,639,776	\$42,086,118	132,953,542	\$66,731,524

of the soil is cultivated although a large part of it is fertile. Absence of adequate transportation prevents production on a large scale. Other important products besides wheat and coffee are tobacco, vegetables, cotton, vegetable ivory, ivory nuts, dyewoods, corn, bananas, and rubber. Mineral resources are rich and varied. In July, 1926, the United States Bureau of Foreign and Domestic Commerce reported that platinum (q.v.) exports from Colombia increased in value from \$2,000,000 in 1922 to \$5,338,126 in 1924, while exports of gold for the same years decreased from \$5,800,000 to \$2,000,000. A little over half of the present production of platinum is taken by hand panning, and the remainder by the large companies, which dredge the river beds. This country now produces one-half of the world's platinum, most of the rest coming from Russia. The Colombian government receives half of the domestic production. The government also operates the emerald mines at Muzo, a Paris concern having a contract for marketing the output. The Muzo production was valued at \$250,000 in 1925. The only other emerald mines

**FINANCE.** The revenues and expenditures for 1925 balanced at 34,441,655 pesos and those for 1926 at 40,829,248 pesos. The budget for expenditures was divided as follows: Interior, 6,593,243; Foreign Affairs, 616,443; Treasury, 9,113,072; War, 3,497,994; Industries, 393,964; Education and Public Health, 3,164,992; Postal and Telegraph, 4,442,725; Public Works, 12,450,687; Controller, 306,272; Supplies, 249,853. The total public debt on June 30, 1925, was 30,075,268 pesos of which 18,293,585 was external and 11,781,683 internal debt.

**COMMUNICATIONS.** In August, 1925, the total length of the railways in Colombia was 1808 kilometers. In the autumn of 1926 a bill calling for the construction of approximately 722 miles of railway within the next four years in Colombia was submitted to the Colombian Congress by the Colombian government. The projected construction is mostly work in extending the various railroads now in operation. Included in the proposed construction are the completion of the Northern, the completion of the Tolima as far as Neiva, the extension of the Pacific from

Ibague to Armenia, and of the Caldas from Nacereros to Armenia. It also includes the proposed extension of the Pacific to Pasto and of the Antioquia from Bolombolo to Cartagena, and the completion through Tunja and Moniquira of the Carare and of the Cucuta Pamp-lona. In addition the bill proposes the extension of the Narino from Tumaco to Piedraccas on the Pasto motor road. It also proposed that the gov-ernment acquire the Santamarta, at present a private concern, and extend it. In the same bill the government seeks authorization to raise a loan of £20,000,000, which will be entirely de-voted to the proposed railroad extensions and other transportation improvements. The bill also calls for the election of a railway and transport board to advise the Ministry of Public Works in the plans and construction of the improve-ments.

GOVERNMENT. The executive power is vested in a president elected for four years by direct popular vote, and legislative power in a congress of two houses; the senate of 34 members, elected indirectly, and the house of representatives with 92 members elected by direct popular vote. Presi-dent at the beginning of 1926, Gen. Pedro Nel Ospina, elected Feb. 10, 1922, who assumed office August 7th of that year.

HISTORY. On February 14 the people of Colombia elected Dr. Miguel Abadia Méndez to the presidency of the republic. He was installed on August 7. He was the candidate of the Conservative Party and really the only one in the field inasmuch as the Liberal Party refrained from voting. Dr. Méndez was born in 1867 in the department of Tolima, where he received his primary education. In 1888 he graduated as doctor of laws and political science and devoted himself later to the practice of law. In 1895 he was Secretary of Finance, of Public Instruction, and Foreign Relations under the administration of Don Manuel Marraquin. In 1902 he was sent to Chile on a special mission and after that he served as Minister of the Interior in three dif-ferent cabinets. Besides holding these offices he has been a representative in Congress, a Sena-tor, and a professor. He appointed the follow-ing cabinet: Foreign Relations, Dr. Marco Fidel Suárez; Interior, Jorge Vélez; War, Ignacio Réngifo; Treasury, J. A. Gómez Recuero; Public Works, Mariano Pérez; Industries, Salvador Franco; Posts and Telegraphs, Silvino Rodrí-guez; Instruction and Public Health, José Jesús García. This cabinet, however, was in office just about four months when it resigned, chiefly be-cause of lack of faith throughout the country in its ability to carry on the affairs of the gov-ernment. Commercial difficulties due to the severe drought from which Colombia suffered were also contributing factors.

COLORADO. POPULATION. According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 939,629. The estimated population on July 1, 1926, was 1,059,000. The capital is Denver.

AGRICULTURE. The following table gives the acreage, production and value of the principal crops in 1925 and 1926:

Crop	Year	Acreage	Prod. bu.	Value
Wheat (spring)	1926	256,000	8,968,000	4,127,000
	1925	260,000	8,900,000	5,265,000
Potatoes	1926	84,000	11,760,000	15,288,000
	1925	80,000	14,040,000	22,692,000
Corn	1926	1,496,000	10,472,000	7,435,000
	1925	1,467,000	22,005,000	15,404,000
Sugar beets	1926	210,000	2,867,000 *	9,815,000
	1925	180,000	1,640,000 *	3,041,000
Dry beans	1926	862,000	1,086,000	5,736,000
	1925	320,000	2,240,000	3,670,000
Barley	1926	417,000	6,672,000	4,994,000
	1925	410,000	8,810,000	2,059,000
Oats	1926	195,000	4,680,000	2,889,000
	1925	214,000	5,778,000	

\* tons.

MINERAL PRODUCTION. The mining of coal, though on a slightly reduced scale, continued in 1925 to supply about one-half of the total of the State's mineral production, reckoned ac-cording to value. There were produced in 1925 10,310,551 net tons, as against 10,444,098 net tons in 1924; the value of the product in 1925 was \$30,322,000, and in 1924 \$31,863,000. Gold production declined in 1925, the value of the product being for that year \$7,205,000 compared with \$8,593,116 in 1924, and the quantity 348,-542 fine ounces in 1925 and in 1924, 415,692 fine ounces. Silver production rose to 4,830,000 fine ounces in 1925 from 3,254,370 fine ounces in 1924, the total being valued at \$3,022,200 for 1925 and \$2,180,428 for 1924. Copper production remained little changed, attaining 2,500,000 pounds in 1925 as against 2,713,219 pounds in 1924, the total value being \$352,500 for 1925 and \$355,432 for 1924. Lead production rose in quantity to 63,000,000 pounds in 1925, from 47,557,061 pounds in 1924, and in value to \$5,707,-800 in 1925, from \$3,804,565 in 1924. Production of zinc likewise rose, to a quantity of 61,000,-000 pounds in 1925, from 56,727,000 pounds in 1924, the value being \$4,636,000 in 1925 and \$3,687,255 in 1924. The total value of gold, silver, copper, lead and zinc produced in the State was in 1925, \$20,923,500; in 1924, \$18,620,796; an increase of \$2,302,704. Clay products attained in 1924 a value of \$3,954,639; in 1923, of \$4,413,602. Manganese and manganiferous ore, mineral paints, zinc and lead pigments, petroleum, sand and gravel and stone were also produced. The total value of mineral products was, in 1924, \$61,487,882; in 1923, \$61,379,146.

The output of gold, silver, copper, lead, and zinc from Colorado mines in 1926 in terms of recovered and estimated recoverable metal was \$6,911,000 in gold, 4,625,000 ounces of silver, 3,350,000 pounds of copper, 66,000,000 pounds of lead, and 65,000,000 pounds of zinc, according to estimates of the U. S. Bureau of Mines. These figures are to be compared with \$7,227,022 in gold, 4,506,940 ounces of silver, 2,360,500 pounds of copper, 62,966,000 pounds of lead, and 61,621,000 pounds of zinc in 1925, and \$8,593,-116 in gold, 3,254,370 ounces of silver, 2,713,219 pounds of copper, 47,557,061 pounds of lead, and 56,727,000 pounds of zinc in 1924. Compared with the 1925 figures, gold shows a decrease of \$316,-022, silver an increase of 118,080 ounces, copper an increase of 989,500 pounds, lead an increase of 3,034,000 pounds, and zinc an increase of 3,379,000 pounds. At estimated average prices for metals in 1926, the value of the output of these metals was silver \$2,886,000; copper, \$462,-000; lead \$5,478,000; and zinc, \$4,778,000. These values added to that for gold gives a

Crop	Year	Acreage	Prod. bu.	Value
Hay	1926	1,618,000	3,265,000 *	\$27,863,000
	1925	1,605,000	3,086,000 *	86,000,000
Wheat (winter)	1926	1,207,000	14,484,000	15,648,000
	1925	896,000	10,752,000	14,628,000

gross value of output for 1926 of \$20,515,000, as compared with \$20,851,287 in 1925, and with \$18,020,796 for 1924.

In 1926, the total production of gold, silver, lead, copper and zinc, attained a value of \$20,482,081, falling below the previous year's total by \$369,186. Gold production was 334,339 fine ounces, in value \$6,911,405; silver, 4,624,000 fine ounces, in value \$2,885,376; copper, 3,350,000 pounds, in value \$462,300; lead, 66,000,000 pounds, value \$5,478,000; zinc, 65,000,000 pounds, in value \$4,745,000. Quantity increases in silver, lead and zinc production were approximately offset by diminished prices as compared with those obtained in the year previous.

**FINANCE.** As summarized by the United States Department of Commerce, payments for the maintenance and operation of the general departments of the State for the fiscal year ending Nov. 30, 1925 were \$10,708,929, and were at the rate of \$10.52 per capita. They included \$1,002,086 for education, apportioned to minor State divisions. The rate per capita for maintenance and operation of the general departments was \$10.41 in 1924, and \$5.53 in 1917. Expenses totaling \$542,154 for interest on debt, and \$5,393,763 for permanent improvements, added to payments for maintenance and operation of departments, made a total of \$16,644,846. For highways was expended the sum of \$6,385,539, of which \$2,623,880 was for maintenance and \$3,761,659 for construction.

Revenue receipts of the State were \$15,888,116, or \$15.61 per capita. They exceeded by \$4,637,033 the payments except for permanent improvements, but were \$756,730 less than the total with these included. Payments in excess of revenue receipts were met from proceeds of debt obligations. Property and special taxes formed 44.3 per cent of the revenue in 1925, as against 45.9 per cent in 1924 and 56.9 per cent in 1917. Their per capita rate was \$6.91 in 1925, \$7.35 in 1924 and \$3.23 in 1917. Earnings of the general departments and compensation for services rendered by State officials furnished 10.4 per cent of the 1925 revenue; business and non-business licenses furnished 22.4 per cent. License receipts were provided chiefly by the taxes on corporations, on sales of gasoline and on licensing of motor vehicles.

The net indebtedness of the State on Nov. 30, 1925, was \$11,334,771, or \$11.13 per capita, as against \$11.30 per capita in 1924 and \$5.02 in 1917. The assessed valuation of property subject to tax was \$1,540,732,487. The State tax levy was \$5,700,710, or \$5.60 per capita.

**TRANSPORTATION.** The total mileage of railroad line Dec. 31, 1925, was 5077.00. Construction in 1926 added 16 miles of first track. The Colorado and Southern abandoned 30 miles of line between Buena Vista and Hancock; the Denver and Rio Grande Western abandoned 17 miles of line between Moffat and Cottonwood.

**EDUCATION.** The constitution of the State Education Association was altered so as to provide a system of delegate assemblies for control and direction of the affairs of the association.

**CHARITIES AND CORRECTIONS.** Chief of the institutions under State direction are the State Home for Dependent and Neglected Children, Denver; State Home and Training School for Mental Defectives, Ridge and Grand Junction; Industrial School for Girls, Morrison; Industrial

School for Boys, Golden; State Reformatory, Buena Vista; State Penitentiary, Canon City; State Hospital, for the insane, Pueblo; Soldiers' and Sailors' Home, Monte Vista; Industrial Workshop for the Blind, Denver; and a State Psychopathic Hospital.

**POLITICAL AND OTHER EVENTS.** At the election on November 2, W. H. Adams, Democrat, was elected Governor, and C. W. Waterman, Republican, was elected to the United States Senate for the term beginning March 4, 1927. A referendum bearing on the issue of alcoholic prohibition, to the effect that the State legislature be authorized to amend the State prohibition law so as to permit the manufacture, sale and importation of alcoholic beverages so far as might not conflict with Federal statutes was rejected by popular vote. Other officers, elected in 1926, to take office in January, 1927, were: Lieutenant Governor, George M. Cortlett; Secretary of State, Charles M. Armstrong; Treasurer, Harry Mulinix; Auditor, W. D. McGinnis; Attorney General, W. L. Boatright; Superintendent of Public Instruction, Katherine L. Craig. The State Supreme Court was to be constituted as follows: Chief Justice, Haslett P. Burke; Associate Justices, John Campbell, John H. Denison, Greeley W. Whitford, John W. Sheafor, John T. Adams, Charles C. Butler.

There occurred in the summer a vigorous political contest within the State Republican party, between the Ku Klux Klan element, supporting U. S. Senator Means for renomination, and the anti-Klan group, sponsoring C. W. Waterman. This contest resulted in the victory of the Waterman forces in the primary election in mid-September.

The equipment of the Motor Transportation Co., conducting an extensive transportation service, was purchased by the Denver and Rio Grande Western Railroad in June.

According to *Oil and Gas Journal* plans were formed late in November for a 400-mile pipe line to convey natural gas from western Texas fields to Denver and intervening points, with the Standard Oil interests as the owners. Unforeseen difficulties were encountered during the year in the construction of the water bore of the Moffat Tunnel, which according to the attorney for the tunnel board, were likely to increase the cost beyond the original estimate of \$6,720,000. Efforts to lease the western slope water rights in connection with the tunnel project had not come to a successful issue by Dec. 4. It was then announced that the railroad tunnel, the main feature of the project, would be finished about July 20, 1927. Work on the Moffat tunnel project from its start in the fall of 1923 to July 1, 1926, was reported to have made progress as follows: Pioneer bore 15,822 feet in from East Portal; Main bore 13,239 feet in from East Portal; Pioneer bore 12,661 feet in from West Portal; Main bore 8000 feet in from West Portal. The pioneer bore above mentioned was identical with the so-called water bore. It was a tunnel of smaller diameter, serving in the first place to carry workers and material to and from the main bore diggings which it paralleled, and after completion to serve as a water conduit. The work on July 1 was about 80 per cent done, the length of the entire tunnel as projected being 6.08 miles, and was progressing at the rate of about 40 feet a day for the main bore, except where impeded by unusual obstacles. It was ex-

pected that the tunnel when put in operation would enable the Denver and Salt Lake rail route to maintain communication throughout the winter with western Colorado, hitherto accessible during the severe part of winter only by round-about routes. It was also anticipated that the tunnel would supply more effectual means of access to agricultural territory west of the Divide, to coal in the Uintah and Green river basins and to an oil shale area in northwestern Colorado.

The fiftieth anniversary of the formation of the State was observed at Denver, August 1. Vice-President Dawes as the chief guest delivered an address, and President Coolidge addressed the State by radio.

**OFFICERS.** Governor, C. J. Morley; Lieutenant-Governor, S. B. Lacy; Secretary of State, C. S. Milliken; Treasurer, W. D. McGinnis; Auditor, Charles Davis; Attorney General, W. L. Boatright; Superintendent of Public Instruction, Mary C. C. Bradford.

**JUDICIARY.** Supreme Court: Chief Justice, James H. Teller; Associate Justices John Campbell, George W. Allen, Haslett P. Burke, John H. Denison, Greeley W. Whitford, and John W. Sheafor.

**COLORADO, FIFTEENTH ANNIVERSARY OF.** See CELEBRATIONS.

**COLORADO, UNIVERSITY OF.** A co-educational State institution of higher education at Boulder, Col.; founded in 1876. The number of students enrolled for the fall term of 1926 was 2767, and the summer quarter had a registration of 3226. There were 244 faculty members, exclusive of assistants. The total income for general maintenance, from State, fees, tuition, etc., was estimated at approximately \$1,100,000, approximately \$400,000 was received, including fees, for operation of hospitals, and for new buildings \$180,000. During the year an addition to the chemistry building was completed at a cost of \$250,000. In the library there were 173,152 volumes, 17,000 pamphlets, and 2410 maps. President, George Norlin, Ph.D., LL.D.

**COLORATION.** See ZOOLOGY.

**COLORÉD METHODISTS.** See METHODISTS, COLORED.

**COLUMBIA UNIVERSITY.** A non-sectarian institution of higher education; founded in 1754. At Morningside Heights, Broadway and 116th St., New York City, are located: Columbia College (for undergraduate men); the professional schools of law, mines, engineering, chemistry, and architecture; the non-professional graduate faculties of political science, philosophy, and pure science; Barnard College (for undergraduate women); Teachers College, including the departments of education and practical arts; School of Journalism; School of Business; School of Library Service; and the University library. The College of Physicians and Surgeons is on West 59th Street, the College of Pharmacy on West 68th Street, and the School of Dental and Oral Surgery on East 35th Street. In addition to the regular session, there is a thorough system of extension teaching, and a summer session at Morningside Heights, as well as a summer camp for engineering students at Morris, Conn.

The enrollment on Nov. 1, 1926 was 24,005, including 3700 in extramural and special courses in University Extension and 4462 registered for Home Study Courses and 2564 duplicates. The resident students were distributed as follows:

Undergraduates, 2938, of whom 1858 were in Columbia College, 1029 in Barnard College, and 51 in other schools; graduate and professional students, as follows: Graduate faculties 2199, law 730, medicine 408, mines, engineering, and chemistry 173, architecture 91, journalism 130, business 338, dental and oral surgery 272, Teachers college 4191, pharmacy 865, optometry 57, library service 105, unclassified 137; university extension 7204. There were 13,219 registered for the summer session of 1926. The faculty and officers of administration numbered 1785, of whom all except 33 were in active service. This number was distributed as follows: 202 professors; 120 associate professors; 187 assistant professors; 100 associates; 296 instructors; 69 lecturers; 143 assistants; and 3 curators; 191 instructors in Teachers College; 15 instructors in the College of Pharmacy; 306 instructors in extension and home study not included above; 60 officers of administration.

Among the appointments of the year 1925-26 were: Prof. John Maurice Clark from the University of Chicago in Economics, Prof. Louis Herbert Gray from the University of Nebraska in Oriental Languages, Prof. Joseph F. Hudnut from the University of Virginia in the History of Architecture, Prof. Alexander M. Kidd from the University of California in Law, Dr. Benjamin P. Watson from the University of Edinburgh in Obstetrics and Gynecology and to be Director of the Sloane Hospital for Women, and Dr. Charles C. Williamson, formerly of the New York Public Library, to be Director of the University Libraries and of the School of Library Service.

Important events of the year 1925-26 included the appointment by the trustees of a committee of seven to study questions relating to the protection of the site of the University and its future development. Plans were also drawn up to provide additional funds. The endowments and control of Sloane Hospital for Women and the Vanderbilt Clinic were transferred from the University to the Presbyterian Hospital. A DeWitt Clinton Professorship in History was established. Columbia College, co-operating with the Union Theological Seminary, established a combined undergraduate and professional course for future students of theology, and a similar course was established for future law students. The courses in optometry were changed to lead to the degree of B.S. A new school of Library Service was established, absorbing and combining with the New York State Library School and the Library School of the New York Public Library. A School of Tropical Medicine was organized at San Juan, Porto Rico, in co-operation with the University of Porto Rico, under the educational direction of the teaching and research staff of Columbia University. Two apartment buildings were purchased by Teachers College, to be used as residence halls. The physics laboratories on the campus were completed, and the Chandler chemistry laboratories, in the Harris Memorial Building, were equipped. John Jay Hall, a residence hall and social centre for Columbia College, was under construction.

During 1925-26 the University received 201 gifts in money representing a total of \$4,007,014.97. The largest items in the list of gifts were: \$1,000,000 from the General Education Board for the new Medical School buildings;

\$700,000 from the estate of Joseph R. DeLamar for the DeLamar Fund; \$267,796.77 from the Carnegie Corporation for the new Medical School buildings; \$262,993.25 from the Estate of F. Augustus Schermerhorn; \$125,000 from an anonymous donor for the Medical School; \$101,105.41 from the estate of Jonas M. Libbey, for the Libbey Fund; \$90,000 from the estate of Robert B. Van Cortlandt for the Van Cortlandt Fund; \$68,000 from the General Education Board for the maintenance of the Department of Practice of Medicine; \$50,000 from Mrs. James P. Donahue for the School of Dental and Oral Surgery; \$35,000 from the Laura Spelman Rockefeller Memorial for research in the social sciences. An Italian House was given by a group of citizens of Italian descent. In addition to the above amount given to the University proper, Barnard College received \$30,233.75, Teachers College \$1,236,513.90, and the College of Pharmacy \$3,014.49.

The total endowment amounted to \$59,409,049.93. The estimated value on July 1, 1925, of University property was \$35,706,125.16. The budget for 1926-27, including not only Columbia University but the affiliated Barnard College, Teachers College, and the College of Pharmacy, was \$11,214,158.10. President, Nicholas Murray Butler, Ph.D., LL.D.

**COLVER, WILLIAM BYRON.** American newspaper man and at one time head of the Federal Trade Commission, died May 28. He was born at Wellington, Ohio, Sept. 26, 1870, and after studying law at Ohio State University, 1891-92 was admitted to the Ohio bar, and practiced in Cleveland and Sandusky until 1894, when he became telegraph editor of the *Cleveland Plain Dealer*. After serving in various newspaper capacities, both as editor and correspondent, he became tax inquisitor, Cuyahoga County (Cleveland) in 1905, and in the following year was Secretary of the Municipal Traction Company of Cleveland. In 1907, he again entered journalistic activity as president and general manager of the Newspaper Enterprise Association, and in 1912, became editor in chief of the "Clover Leaf" Publications in St. Paul, Minn. Mar. 15, 1917, he was made a member of the Federal Trade Commission, and from June 8, 1918, to July 1, 1919, he served as its chairman. He was a member of the price-fixing committee of the War Industries Board, 1918-19, and organized the pulp and paper section of that body in 1918. He retired from the Federal Trade Commission Sept. 25, 1920, and was general editorial manager of the Scripps-Howard newspapers, and president and general manager of the Newspaper Enterprise Association, and general manager of the Newspaper Information Service, Inc. He was also treasurer of the Atlantic Shores Corp. at Miami, Florida.

**CONGO, BELGIAN.** A Belgian colony in Central Africa, formerly the Congo Free State, which was annexed to Belgium in 1908. The

boundaries were defined by declarations of August, 1885, and December, 1894, and by treaties with Germany, France, Great Britain, and Portugal. Area, estimated at 909,654 square miles; the native population is placed at 8,500,000 (Bantu). On Jan. 1, 1925, the white population numbered 12,795, of whom 7770 were Belgians. The chief city and former capital is Boma; by a royal decree of 1923, the capital was transferred to Kinshasa, which was renamed Leopoldville. Other important towns are Elizabethville, Stanleyville, and Kookilhatville. Catholic and Protestant bodies carry on missionary work, the number of Catholic missionaries being 888 and of Protestants, 518. In cooperation with the government they supply means of education, and there are several educational institutions under direct government control, at the more important towns. In 1925 the government grant for education to the missionaries amounted to 2,417,000 francs, while the total expenditure on education was 2,432,700 francs.

**COMMERCE, FINANCE, ETC.** The total imports in special trade in 1924 were £21,640,000 and the exports, £19,080,000. The chief imports were cotton goods, provisions, machinery, wines and spirits, steamers and ships, and arms and ammunition; the principal exports, palmnuts, copper, copal, palm oil, rubber, and ivory. In 1925 the revenues were estimated at 146,555,000 and the expenditure, 137,086,745 francs. The public debt on Dec. 31, 1923, was 543,410,235 francs. Expenditures, as a rule, regularly exceed revenues, with the result that loans frequently have to be resorted to, in order to balance the budget.

Steamers, belonging to the state, ply on the Congo in the navigable section from its mouth to Matadi, a distance of 95 miles, and government and private companies supply a transport service on the upper Congo and its tributaries. There are over 1000 miles of navigable water between Stanley Pool and Stanley Falls, and above Stanley Falls there is another navigable section of about 585 miles. The tributaries of the Congo are also navigable for part of their courses. The railway mileage on Jan. 1, 1924, was placed at 1268 miles, and the road mileage, partly suited to motor traffic, was placed at 7125 miles. Two sections of the Cape-to-Cairo railroad run through Belgian Congo, the distance from Elizabethville to Capetown on that road being 2300 miles. Although improvements involving the alignment of track and reduction of grades have increased the carrying capacity of the railroad between the ports of Matadi and Stanley Pool by 120,000 tons a year in each direction, hauling to and from the interior of the Belgian Congo still continues to be greatly restricted. The increase is insufficient for the volume of freight, both import and export, offered to the railway. A proposal has been made to construct seven locks in the cataract section of the Congo, thereby enabling ocean steamers to proceed to unload at Stanley Pool instead of Matadi, and eventually to abandon the railway. The proposal is based on the assumption that the railroad from Matadi to Stanley Pool will never be able to meet the traffic demand because of adverse operating conditions. During the year progress was being made in the construction of a 625-mile railway from Bukama to Ilebo, but was restricted at Ilebo, because of the difficulty of securing materials from Matadi. The line,

which will probably be completed in 1928, will enable passengers to travel from Capetown to the lower Kasai district, without changing. A final survey has been completed for a railway to be constructed from Stanleyville, to the Kilo-Moto gold districts.

The Governor General at the beginning of 1926 was M. Rutten.

**CONGO FREE STATE.** See CONGO, BELGIAN.  
**CONGO, FRENCH.** See FRENCH EQUATORIAL AFRICA.

**CONGREGATIONALISM.** A religious denomination founded in the United States by the Pilgrims in Plymouth, Mass., in 1620, under the leadership of Brewster, Bradford, and Winslow. The origin of this movement lay in the Separatist activity in England. The Puritans of Massachusetts Bay followed a similar tendency, and as a result the essential elements of Separatism and Puritanism were combined into Congregationalism. In this denomination each church holds the right to frame its own statement of belief and the policy of the denomination as a whole represents adaptation to conditions rather than accord with a theory of church government. The National Council, by which the administrative affairs of the church are carried on, has no ecclesiastical authority, but includes ministerial and lay delegates elected by the State Conferences. The National Council meets biennially, the session in 1925 being held in May at Washington, D. C.

Statistics of the denomination for Jan. 1, 1926, showed 5636 churches, 5510 ministers, and a church membership of 901,660. The Sunday school enrollment was 797,987; there were 2996 young people's societies, with a membership of 121,910. The total raised for all benevolences was \$4,713,831, and the home expenses of the church were \$20,772,218. Contributions to the Pilgrim Fund, a ministers' pension system, were \$4,850,426. The National Benevolence Societies of the denomination are: American Board of Commissioners for Foreign Missions, Woman's Boards of Foreign Missions, American Missionary Association, Congregational Church Building Society, Congregational Education Society, Congregational Sunday School Extension Society, Congregational Foundation for Education, Congregational Board of Ministerial Relief, and Congregational Woman's Home Missionary Federation.

The American Board of Commissioners for Foreign Missions is the oldest foreign missionary society in America, having been organized June 29, 1810. In 1926 it conducted 17 missions in 15 countries; the stations connected with these missions numbered 108, and the out-stations 1735. The missionaries holding life appointments were 696, and included 172 ordained men, 71 unordained, 224 wives, and 231 single women; in addition there were 113 associates who serve for shorter periods, making a total of 809 missionaries. Religious services were carried on in 2588 places, where there were 557 organized churches, with 93,159 communicants. The total constituency, including church members and all influenced by missions, numbered 268,237; there were 1342 Sunday schools and 76,144 pupils. In the educational field the Board had 33 theological and training schools, with 1754 pupils, and 9 colleges, with 2748 students, as well as many secondary and elementary schools. In schools of all types there were 95,228 pupils. There were 35

hospitals and 44 dispensaries. Expenditures of the Board for the year ending Aug. 31, 1925, were \$2,396,920.73. During the year the Woman's Board of Missions, the Woman's Board of the Interior, and the Woman's Board of Missions for the Pacific were merged with the American Board.

The field of the American Missionary Association extends from the Atlantic Coast to the Hawaiian Islands and Porto Rico. It includes: In the South and the Southwest the Negroes, the Highlanders, and Spanish-speaking people; in the West the Indians; throughout the country the Orientals. The statistics of the Association for 1925-26 showed 380 churches; 17,036 members; 32 schools, with 7715 pupils. The expenditures during the same period amounted to \$1,066,537.

The Home Missionary Society carried on its work in 1925-26 in 42 States, with 1478 missionaries under commission for the whole or part of the year. The chief foreign work was carried on among the German people, 68 churches and missions using that language in their service. During the year 36 new churches were organized and 36 new church buildings erected. Receipts of the society for the year totaled \$442,098.88. The total receipts of the Church Building Society in 1925-26 were \$694,408.66. The contributions for church buildings amounted to \$178,826.30; repaid grants and sales of abandoned churches were \$144,876.79; and income from other sources \$155,407.27. The Board voted 229 church grants and loans and paid \$559,648.98 on 127 new churches and 26 parsonages.

The denomination conducts 10 theological seminaries, the more important being: Union Theological College, Chicago; Yale Divinity School; Hartford School of Religious Pedagogy; and the Theological School at Harvard University. In addition there are 41 colleges, some of which are undenominational, but have historical relation to Congregationalism.

The headquarters of the National Council are at 287 Fourth Avenue, New York City. In 1925-27, Mr. F. J. Harwood of Appleton, Wis., was moderator of the Council; Rev. D. F. Bradley of Cleveland was associate moderator; Mrs. E. A. Osbornson, Chicago, and Rev. W. S. Cash of New Orleans, were assistant moderators; Rev. Charles E. Burton, New York, was secretary; and Franklin H. Warner, New York, was treasurer. The Publishing Society of the Church maintains branches at 14 Beacon Street, Boston, and 19 South La Salle Street, Chicago. The table below is a reprint from the *Congregational Year Book* for 1925 and shows statistics of international Congregationalism:

MINERAL PRODUCTION. The State as a producer of minerals figures chiefly in its output of clay products, stone, sand and gravel and lime, named in the order of the value of the totals produced in 1924. Total mineral production attained in 1924 a value of \$8,129,332; in 1923, of \$7,177,266. Clay products in 1924 were valued at \$3,469,921, exclusive of pottery; in 1923, at \$3,665,174. The quantity of stone produced was, in 1924, 1,849,670 short tons; in 1923, 1,482,710 short tons; the product in 1924 was valued at \$2,251,566, and in 1923 at \$1,830,413. Sand and gravel production was, in 1924, 1,191,421 short tons, showing a notable increase over the production of 1923, 691,439 short tons; the product was valued in 1924 at \$1,175,757, and in 1923 at \$303,433. Of lime were produced in 1924 58,851 short tons; in 1923, 59,158 short tons; in value, \$796,541 in 1924 and \$813,254 in 1923. Lime sold by producers in 1925 was estimated at 63,000 short tons, with a value of \$762,000.

FINANCE. As summarized by the United States Department of Commerce, payments for the maintenance and operation of the general departments of the State for the fiscal year ending June 30, 1925 were \$21,275,926. Their rate per capita was \$14.02, as against \$11.38 in 1924, and \$7.13 in 1917. Their total included \$1,337,974 for education apportioned to minor State divisions. Expenses totaling \$18,718 for public service enterprises, \$656,865 for interest on debt and \$4,783,316 for permanent improvements, added to payments for maintenance and operation of departments, made the total of State payments \$20,734,825. For highways was expended the sum

of \$10,536,133, of which \$7,440,583 was for maintenance and \$3,095,550 for construction.

Revenue receipts of the State were \$20,295,037, or \$19.30 per capita. They exceeded by \$7,343,528 the total payments except those for permanent improvements, and furthermore, exceeded by \$2,560,212 the total with these included. The excess of revenue was reflected in purchase of investments and in cash balances. Property and special taxes formed 26.6 per cent of the revenue in 1925, as against 25.2 per cent in 1924 and 38.4 per cent in 1917. Their per capita rate was \$5.13 in 1925, \$4.31 in 1924 and \$4.82 in 1917. Earnings of the general departments and compensation for services rendered by State officers furnished 11.5 per cent of the 1925 revenue. Business and non-business licenses furnished 50.8 per cent. License receipts were provided chiefly by the taxes on incorporated companies, on the sale of gasoline and on the licensing of automobiles.

The net indebtedness of the State on June 30, 1925, was \$4,134,652, or \$2.27 per capita, as against \$3.11 in 1924 and \$6.56 in 1917. The assessed valuation of property subject to tax was \$2,258,265,601. The State tax levy was \$1,762,709, or \$1.16 per capita.

TRANSPORTATION. The total mileage of railroad line under operation Dec. 31, 1925 was 908.57. There was no new construction of moment in 1926.

EDUCATION. As presented in the *Journal of the National Educational Association*, the advances in educational activity effected during the year included the formation of a plan of coöperation between the State Board of Education and Yale University. Under this plan the State educational division of rural education will provide opportunities in schools for field service for selected students in the University Graduate School who are studying the subject of supervision at the University. The State Board of Education inaugurated radio programmes to promote music appreciation. These programmes, broadcast in conjunction with radio broadcasting station WTIC, were devised to appeal to primary, upper and high school pupils. A descriptive sheet was sent to teachers, in order to enable them to prepare their classes to hear the concerts with the necessary understanding.

The school population in September, 1925, was 370,155 and the total enrollment for 1925-26 was 297,237, of which 259,297 were in common schools and 37,940 in high schools. The current expenses totaled \$23,108,482.03 and the capital outlay \$9,241,532.73, making a total expenditure for education of \$32,350,014.75. The average salary of teachers was \$1607. The items of expenditure above do not include the appropriation made to the State Board of Education for operating expenses and for normal schools and trade schools.

CHARITIES AND CORRECTIONS. Beneficiaries under the State widows' aid law numbered, on June 30, 705 widows and 2103 children. In the year to that date 215 new applications had been received for aid under this law, and 162 applications had been approved. Aid provided in the year totaled \$408,567 and averaged \$11.12 a week to the family. Applications for pauper State aid in the year ending June 30 numbered 1472 and covered 1860 individuals. This form of aid is extended to needy persons within the State

who have no legal residence within any town; the town otherwise being responsible for their successor. Towns were reimbursed to the amount of \$57,520 for aid that they had advanced to persons for whom they were not responsible. The following State institutions had the numbers of inmates named: Connecticut State Hospital, 2825; Norwich State Hospital, 2035; Mansfield School and Hospital, 605; Tuberculosis Sanatorium, 737.

**POLITICAL AND OTHER EVENTS.** At the general election of November 2 Governor John H. Trumbull, Republican candidate, was reelected governor. He obtained a plurality of about 81,000 votes over his Democratic opponent, Charles G. Morris. Senator Hiram Bingham, Republican, was reelected to the United States Senate for the term beginning March 4, 1927, receiving about 80,000 more votes than the Democratic candidate, Rollin U. Tyler. All five of the U. S. Representatives from the State were reelected to the 70th Congress; all were Republicans.

There convened at Hartford on November 15 a conference of delegates from the six New England States, for the purpose of furthering the economic welfare of the region as a whole. It dealt with a wide range of problems, which included marketing, manufacturing, legislation and transportation. Particular attention was given the problem of providing the New England area with cheaper and more abundant power. Owen D. Young, chairman of the directors of the General Electric Company, addressed the conference to advocate measures needed for a more complete union of the hydroelectric resources of New England into a superpower system. Steps were taken by the State in April to cooperate with the County of Westchester in New York for the extension of the Hutchinson River Parkway. A policy of widening existing highways where most necessary to make them adequate to increasing traffic needs was outlined by State authorities.

The State Democratic convention, September 16, declared for the repeal of the Eighteenth amendment to the U. S. Constitution. Gerald Chapman, a robber, was hanged at Hartford April 5, on conviction in a State court of having murdered a New Britain policeman. He had been a Federal prisoner at Atlanta prior to his removal to Connecticut to be tried there. His counsel protested against the legality of his removal from Federal imprisonment. President Coolidge in 1925 sought to simplify the legal difficulties by commuting the Federal sentence, but Chapman refused to accept the release from Federal custody which meant for him a prospect of early execution. He sued for a writ of habeas corpus in the Federal courts, carrying appeal successively up to the U. S. Supreme Court which refused March 15 to review the case, and left him in the hands of the State. The contention on his behalf was that the release from Federal prison was not in effect an act of clemency and was therefore *ultra vires*.

**COOLIDGE, WILLIAM AUGUSTUS BREVOORT.** American clergyman and Alpinist, died at Grindelwald, Switzerland, in May. He was born in New York City, Aug. 28, 1850, and was educated at St. Paul's School at Concord, N. H., and at Oxford, where he took numerous honors in history and jurisprudence, receiving the degree of B.A. in 1874; M.A. 1876; and honorary Ph.D. from the University of Bern in 1908. He was ordained deacon in 1882 and priest in 1883, after serving as Professor of English History at St. David's College, Lampeter, 1880-81, and at Magdalen College, Oxford, 1881-85. He was interested in climbing in Switzerland from an early age, and was a member of all the leading Alpine clubs and societies. In 1909, he settled permanently in Switzerland, making his headquarters at Grindelwald, where he housed an extensive library of Alpine literature. He was credited with the ascent of some 1200 peaks and passes, many of which were first ascents, and he visited every district of the Swiss, French, and Italian Alps.

Dr. Coolidge published many papers and from 1880-89 was editor of the *Alpine Journal*. His published works include: *Climbers' Guide to the Bernese Oberland*, (new edition of vol. i, 2 parts, (1909-10), and (vol. ii, (1904); *Josias Simler et les Origines de l'Alpinisme jusqu'en 1600* (1904); *The Alps in Nature and History* (1908); *Die Petronella-Kapelle in Grindelwald* (1911); *A List of My Writings* (1868-1912) *Relating to the Alps of Switzerland* (1912); *Alpine Studies* (1912); *Die älteste Schutzhütte im Berner Oberland* (1915); and *Johann Madutz* (1917). He was editor of: *Alpine Journal* (1880-89); the late Aubrey Moore's lectures and papers on the *History of the Reformation* (1890); Murray's *Handbook for Switzerland* (eighth edition) (1891), and (nineteenth edition) (1904); and of *A Pioneer in the High Alps*, (Alpine Diaries and Letters of F. F. Tuckett, 1865-1894) (1920).

**COÖPERATION. AGRICULTURE.** In the 1925 YEAR BOOK there was given a detailed statistical summary of the growth of the coöperative movement in American agriculture. The movement showed few signs of diminishing and its growth was being spurred on by the low price of agricultural commodities in an era of general prosperity. The Secretary of Agriculture, William M. Jardine, in a speech in June, 1926, before the American Institute of Coöperation saw in co-operative marketing the best solution of the farmers' troubles. He declared that already an aggregate business of \$2,500,000,000 was handled by the coöperative marketing associations in 1925. See **HORTICULTURE**.

It should be pointed out that the progress of agricultural coöperation has not been altogether without setbacks. At the close of the year the newspapers announced that the Tri-State Tobacco Growers' Association was in the hands of a receiver. The association had taken in some \$98,000,000 worth of business during the four years of its existence, but during the same period its overhead expenses were \$20,000,000. It was this wasteful overhead, coupled with an inadequate knowledge of the marketing situation, which was responsible for the failure of the organization. According to the *Greensboro* (N. C.)

*News*, it would seem that "the people who did not know how to market paid the people who thought they did" an altogether too high financial tribute. The *New York Times* saw in this unfortunate bankruptcy some justification for skepticism with regard to the general movement of agricultural coöperation, despite the "brilliant success" of the California fruit growers. But that is to build too big a moral on a relatively small episode.

Agricultural coöperation was a principal theme of discussion at the fifth congress of the Coöperative League of America which was held at Minneapolis, November 4-6. Analyzing the relation that should exist between the consumers' coöperatives and the coöperative marketing movements, Mr. A. S. Goss, of the Associated Grange Wholesale, suggested that the real solution would be for the consumers to own and to operate the farms. This, however, was a long way off. Meanwhile, he pointed out, the farmer is learning the value of marketing coöperation as a means of getting better prices for his goods, and he is at the same time learning the value of consumer coöperation by joining the stores for the purchase of farm implements and household goods. Mr. George Keen, secretary of the Coöperative Union of Canada, stressed the fact that though there was a fundamental difference in the immediate aims of farmers' and consumers' societies, there was a great need of coordinating the efforts of the two. A statement of this need of coördination was embodied in one of the resolutions adopted by the convention.

GENERAL. Indications as to the state of the American coöperative movement in general fields are furnished by the reports and discussions of the coöperative convention referred to above, and by the statistical compilation of the Bureau of Labor Statistics showing the resources of the movement at the close of 1925. The convention was attended by 65 delegates representing 132 societies, as well as by delegates from the Coöperative Union of Canada, the Manitoba Wheat Growers, the Farmers' Union of Iowa, and the Washington State Grange. The report for the year showed that there were altogether 152 constituent societies within the league, of which 104 were organized for the purposes of education and propaganda into four district leagues. The national body itself was purely an educational and informational body, performing such functions as providing speakers, furnishing an auditing service to the constituent members, acting as an employment bureau, etc. Besides the topic of agricultural coöperation, the conventions discussed the relation of consumers' coöperation (1) to the labor movement in general, (2) to coöperative insurance, and (3) to coöperative credit unions.

The convention (according to the report published in the *Monthly Labor Review*) passed resolutions recognizing the coöperative movement as a working class movement, which therefore should seek the coöperation of all workers' and farmers' movements, and urging upon the constituent societies the use of union-label goods and the employment of union workmen as far as possible. Another resolution protested against the use of injunctions in labor disputes. In the matter of coöperative insurance a resolution recorded the appointment of a committee to study existing coöperative insurance societies in this country and abroad with a view

to undertaking the formation of an insurance society.

The accompanying table gives the membership of American coöperative societies and of American credit unions, according to the Bureau of Labor Statistics. It should be borne in mind that not all the consumers' coöperatives are affiliated with the Coöperative League of America, and that the coöperatives listed do not include housing societies. Figures as to wholesale coöperatives are lacking, but it was brought out in the discussions of the coöperative convention that most of these societies had died out in the last few years. As many as 18 were affiliated with the league in 1919.

State	Consumers' societies		Credit societies

\* Working members only; does not include 2,346 stockholders not employed in coöperative work.

\* Value of property controlled in 1925.

**CREDIT UNIONS.** These tables showing the amount of business done by credit unions should be interpreted in the light of the fact that most of these unions have grown up within the last eight years. Undoubtedly this form of coöperation is the fastest growing at the present time, and its growth is symptomatic of the same tendency as reflected in the labor banking movement. Neither credit unions nor labor banking would have been possible but for the existence of a large class of wage earners with surplus savings and the intelligence to use them to best advantage. The average membership of the credit unions, as reported by the Bureau of Labor Statistics, is 612 per society. The average loan per borrower is \$381 per member. A large number of unsecured loans are made, with remarkably little loss. The interest rate is never higher than 8 per cent, and in most cases less.

**FOREIGN COUNTRIES.** Significant items of news on coöperation in foreign countries are given here. They have been compiled from the *Monthly Labor Review* and the *International Coöperative Bulletin*.

**Czecho-Slovakia.** A state publication of 1926 lists the credit and non-credit societies of Czecho-Slovakia as of Dec. 31, 1924, as follows:

Credit societies .....	6,151
Other types:	
Agricultural societies .....	3,740
Industrial and commercial .....	1,607
Consumers societies:	
Consumers societies proper .....	1,810
Housing societies .....	1,349
Other .....	47
	2,676
Public utility societies .....	68
	14,237

No data as to membership or amount of business were given.

**Denmark.** The amount of business done by the Danish Wholesale Coöperative Society during the year 1925 was 165,340,137 kroner. This was a decrease of about 40,000,000 kroner as compared with the figure for the previous year. The *International Cooperative Bulletin* explains that "this, however, was entirely due to the fall in prices following the great rise in value of the krone on its way to par during the last six months of the financial year." The value of the krone was 24.9c. in December, 1925. Profits also showed a decrease for the year 1925, totaling only 3,699,473 kroner. Nevertheless the Society was able to pay its patronage a dividend of 3 per cent. Manufactures of goods amounted to 47,039,125 kroner, the quantity far exceeding that of any previous year. The affiliated societies, the balance sheet showed, numbered 1804, with a combined membership of 337,500. Reserves totaled 21,402,936 kroner; and depreciation reserves, 9,700,000 kroner. The paid-in share capital amounted to 1,468,400 kroner.

**Italy.** The National League of Coöperative Societies was dissolved by the Italian Fascist government in November, 1925. At the recent convention of the Coöperative League of America an expression of sympathy was voted by the delegates, and it was suggested that an international congress of coöperative societies be convoked to combat international Fascism.

**Russia.** According to data compiled by the Russian Information Bureau, the total member-

ship of coöperatives in the Soviet Union was 25,000,000 (June, 1926). The consumers' coöperative organization embraced, on Jan. 1, 1926, 26,479 societies with 10,163,109 members. The amount of business for the year ending Sept. 30, 1925 was \$2,008,500,000, and for the year ending Sept. 30, 1926 estimates based on ten months indicated a probable turn-over of well over \$3,000,000,000.

In view of the predominantly agricultural population of Russia, agricultural coöperation plays a highly important rôle, the government encouraging these organizations as much as it can. Statistics printed in the *Russian Review* (October, 1926) show that agricultural coöperation has made tremendous strides in the last few years. On Jan. 1, 1926, there were in existence 31,000 federated agricultural coöperatives, and some 20,000 independent societies. The membership embraced 6,500,000 peasant farms, or 28 per cent of all the peasant farms in the Soviet Union. The coöperatives are handicapped by an inadequate capital, their share capital amounting to \$11,000,000. With this capital, and with the aid of government loans, the societies succeeded in carrying on a business with a turn-over estimated at \$600,000,000 for the fiscal year 1926.

**Sweden.** In Sweden at the end of the year 1925, 902 coöperative societies were in existence, according to the *International Cooperative Bulletin*. The total business was 259,700,000 kronor (Swedish currency was approximately at par, 26.9 cents). Of this about 36.5 per cent was of goods purchased from the wholesale societies. The share capital of the societies was 39,536,052 kronor, or 68.90 per member. There was a surplus of 11,099,448 kronor at the end of the year's business. See also CHINA.

**COÖPERATION.** See AGRICULTURE; AGRICULTURE, UNITED STATES DEPARTMENT OF; CHINA.

**COPPER.** In 1926 the United States continued to be the leading copper producer of the world, accounting for 54 per cent of the total output, as compared with 15.2 per cent for Chile and Peru, 6.8 per cent for Africa, and 24 per cent for all other countries. The industry by January, 1926, had returned to the pre-war level, and continued through the year on this basis; though both costs and prices were on a lower scale than previously. In North and South America there apparently was a greater capacity in the existing plants than there was demand for the product, while in Africa the production was handicapped by lack of labor, and notwithstanding anticipations was substantially lower than in 1925. The average copper price for the year was about 137½ cents per pound, as against 14 cents in 1925, 13 cents in 1924, and 14.421 cents in 1923. There was an increased production and consumption of the metal, and in most of the plants increased economies were manifested, so that there was an improvement in cost without wage reductions. The companies controlled by United States capital in North and South America, which produced some 1,050,000 tons of copper, were paying interest and dividends to the bond and stockholders, on the basis of 1925 earnings, and it was estimated that such dividends were equivalent to about 3¼ cents per pound produced, while in 1926, allowing for the increased output, the actual rate of distribution was estimated at about 3½ cents per pound, on a total distribution of \$73,000,000. On Oct. 15, 1926 Copper

Exports, Inc., began business to carry on the American export trade, and it was anticipated that it would exert an important effect in stabilizing conditions and handling the export stock of American plants.

The world's output of primary copper in 1926, according to the annual review number of the *Engineering and Mining Journal*, was estimated at 1,658,000 tons, as compared with 1,588,000 tons in 1925, or an increase of 70,000 tons. On Jan. 1, 1926, the stock of rough copper in all forms in North and South America was 240,000 tons, as compared with 276,000 tons on December 31. In the United Kingdom the copper stock on Jan. 1, 1926, was 56,500 tons and at the end of the year 30,000 tons, or a decrease of 26,500 tons, which almost exactly offset the increase in the United States. However, the demand for copper in the industries was such that it was estimated that the entire increase in production would be taken care of.

The *Engineering and Mining Journal*, New York, gave the accompanying tables which indicate the more important statistics of the year.

estimated smelter production from domestic ores for December, as reported by the smelters, was 157,000,000 pounds, 13,000,000 pounds more than the average for the 11 months which preceded it. The estimated production for December, 1925, was 137,000,000 pounds, which was below the monthly average for that year. Both smelter and refinery production showed small increases over previous peace-time records, and while stocks of refined copper increased, stocks of blister copper decreased sufficiently so that there was little change in total stocks.

Aside from production the outstanding features of the copper industry in 1926 were record-breaking imports and domestic consumption. The European countries did not make the demands on the market that had been anticipated and, instead of increasing, exports to Europe decreased largely in 1926. Exports to France, however, showed a notable increase.

The production of new refined copper from domestic sources, determined in the same manner as smelter production, was about 1,738,000,000 pounds, compared with 1,683,000,000 pounds

### COPPER PRODUCTION OF IMPORTANT COUNTRIES

*Based on blister, referred to country of origin*

*From data compiled by the American Bureau of Metal Statistics  
Tons of 2,000 lb.*

Country	1916 <sup>a</sup>	1922	1923	1924	1925	1926 <sup>b</sup>
United States	971,123	511,970	754,000	819,000	854,000	984,000

World's total	1,533,810	996,147	1,414,807	1,523,483	1,586,683	1,650,000

<sup>a</sup> War peak of production in United States was in 1916. War peak of world production was in 1917, the total being 1,580,475 tons.

<sup>b</sup> 1926 figures, partly estimated; figures for individual countries not comparable with figures for other years, as blister copper is not segregated according to countries of origin.

### PRIMARY COPPER PRODUCTION BY UNITED STATES MINES, AND FOREIGN SUPPLY TO UNITED STATES SMELTERS

*[American Bureau of Metal Statistics, in tons of 2,000 Pounds]*

	1924	1925	1926
Porphyry mines	315,351	320,151	345,838
Lake mines	68,828	78,013	87,116
Vein mines	369,347	400,199	395,260
Custom ores	39,668	43,754	44,104
Total crude production	793,194	842,117	872,318
Imports in ore, matte, etc.	76,139	81,665	74,000
Blister produced from scrap	4,621	12,567	19,961

Total supply	873,954	936,349	966,279
Smelter production	898,464	947,333	984,135

<sup>a</sup> Imports for December estimated.

The smelter production of copper from domestic ores in 1926 in the United States as determined by the Bureau of Mines, from reports of the smelters showing actual production for 11 months and estimated production for December, was 1,742,000,000 pounds, compared with 1,675,000,000 pounds in 1925. The 1926 production was the largest peace-time output, being approximately 4 per cent higher than that of 1925, which was heretofore the highest recorded with the exception of the war years, 1916, 1917, and 1918. The

in 1925. In 1926 the production of new refined copper from domestic and foreign sources amounted to about 2,346,000,000 pounds, compared with 2,205,000,000 pounds in 1925, an increase of 141,000,000 pounds or 6 per cent. The production of secondary copper by primary refineries increased from 198,000,000 pounds to about 207,000,000 pounds in 1926, or 9,000,000 pounds, so that the total primary and secondary output of copper by the refineries was 150,000,000 pounds higher in 1926, being about 2,553,000,000 pounds compared with 2,403,000,000 pounds in 1925.

Refineries in the United States reported that at the end of 1926 approximately 131,000,000 pounds of refined copper were in stock, an increase from 124,000,000 pounds at the end of 1925. It was estimated that stocks of blister copper at the smelters, in transit to refineries, and at refineries, and materials in process of refining, were 415,000,000 pounds on December 31, compared with 432,000,000 pounds at the end of 1925, a decrease of 17,000,000 pounds. The increase of 13,000,000 pounds in refined stocks during the year and the decrease of 17,000,000 pounds in stocks of blister and unrefined materials, made a net decrease in stocks of 4,000,000 pounds.

The quantity of refined copper withdrawn on domestic account during the year was about 1,584,000,000 pounds, compared with 1,401,000,000 pounds in 1925, an increase of 183,000,000 pounds. The year 1918 was the only one in which domestic withdrawals surpassed those of 1926. The method of calculation is shown below:

**NEW REFINED COPPER WITHDRAWN FROM  
TOTAL YEAR'S SUPPLY ON DOMESTIC  
ACCOUNT, 1925-1926, IN POUNDS**

	1925	1926
Refinery production of new copper from domestic sources .....	1,688,000,000	1,788,000,000
Refinery production of new copper from foreign sources .....	521,000,000	608,000,000
Imports of refined copper (December, 1926, estimated) .....	100,000,000	132,000,000
Stocks of new refined copper January 1 .....	248,000,000	124,000,000
Total .....	2,547,000,000	2,602,000,000
Exports of refined copper (ingots, bars, rods, or other forms, December, 1926, estimated) ....	1,022,000,000	881,000,000
Stocks December 31 ....	124,000,000	137,000,000
Total .....	1,146,000,000	1,018,000,000
Total withdrawn on domestic account .	1,401,000,000	1,584,000,000

**IMPORTS AND EXPORTS.** The imports of unmanufactured copper during the calendar year 1926, according to the U. S. Bureau of Foreign and Domestic Commerce, amounted to 153,594,877 pounds of copper ore, concentrates, and matte, valued at \$19,065,075, as compared with 163,328,946 pounds in 1925. The imports of unrefined copper, including black, blister, and converted, in pigs, bars, etc., in 1926 totaled 476,015,696 pounds, valued at \$60,736,412, as compared with 379,333,500 pounds and \$48,870,358 in 1925. The imports of refined copper in 1926 amounted to 134,519,125 pounds, valued at \$18,458,579, as compared with 99,773,546 pounds, valued at \$13,831,407, in 1925.

The exports of copper in 1926 totaled in value \$141,203,636, as compared with \$161,165,820 in the previous year. These included: ores, concentrates, composition metal, and unrefined copper (copper contents), 5,465,152 pounds, valued at \$611,630, as against 1,839,093 pounds, valued at \$232,236, in 1925; refined copper in ingots, bars, or other forms, 856,124,528 pounds, valued at \$121,231,224 in 1926, as against 968,065,437 pounds, valued at \$140,220,827 in 1925; rods, 44,490,407 pounds, valued at \$6,857,722, against 54,269,842 pounds, valued at \$8,098,281, in 1925; wire 13,070,126 pounds, valued at \$2,247,861, as against 11,665,579 pounds, valued at \$2,094,108 in 1925; insulated wire and cable, 18,552,559 pounds, valued at \$4,816,308, as against 17,816,993 pounds, valued at \$4,900,264 in 1925. Of the exports of refined copper in 1926 the United Kingdom took 180,320,237 pounds, valued at \$25,458,147, a decline from 183,752,066 pounds, valued at \$26,702,786, in 1925; France took 175,150,816 pounds, valued at \$24,804,406, an increase from 145,809,549 pounds, valued at \$21,059,296, in 1925; and Germany took 153,360,480 pounds, valued at \$21,802,585, a decrease from 229,291,382 pounds, valued at \$32,991,251, in 1925.

**COPYRIGHT.** Registrations for the fiscal year 1925-26, according to the report of the

U. S. Register of Copyrights, numbered 177,635, as compared with 165,848 for the preceding year. Of these 73,455 were classed as books, but included pamphlets, leaflets, and contributions to periodicals, those printed in the United States numbering 68,776, those printed abroad in a foreign language 3430, while the remainder, 1249, were English books registered for ad interim copyright. The chief classes of the remaining registrations, in order of numerical importance, were: Periodicals, 41,169; musical compositions, 25,484; prints and pictorial illustrations, 13,382; photographs; dramatic or dramatico-musical compositions; works of art, including models or designs; maps; drawings or plastic works of a scientific or technical character; and motion picture photoplays. The renewals numbered 4029, as compared with 3309 in the preceding year. The fees paid during the year amounted to \$178,307.20. The total number of articles deposited from July 1, 1897 to June 30, 1926, was 6,003,676.

The effort to amend the copyright law in order to permit the United States to enter the International Copyright Union continued to be unsuccessful; bills for this purpose were again introduced in the 69th Congress, and were referred to the respective Committees on Patents. No action beyond committee hearings was taken by either House or Senate up to the close of the fiscal year except the enactment on July 3, 1926, of an amendment of section 15 of the Act of 1909, relating to manufacture. This provided that the general requirements of the act should not apply "to works printed or produced in the United States by any other process than those above specified in this section." On Nov. 18, 1925, the President issued a proclamation in behalf of citizens of Chile, under authority of section one (e) of the Act of 1909, copyright controlling the mechanical reproduction of music.

The gross receipts of the Register's office for the fiscal year were \$185,038.29; the total expenditure for salaries \$159,764.79; and for supplies, \$985.74. The year's business showed a substantial increase over that of 1925, which was the largest in the history of the office up to that time.

**CORN.** Production estimates received from fourteen countries by the International Institute of Agriculture at Rome indicated a total production in 1926 of 3,228,790,000 bushels, as compared with 3,388,550,000 bushels produced by these same countries in 1925. These data did not include the Soviet Republics, the Serb-Croat-Slovene State, Mexico and the South American countries. The yields of some of the leading corn-producing countries were reported as follows: Roumania 203,366,500 bushels, Italy 118,105,500 bushels, Hungary, 78,826,100 bushels and Czechoslovakia, 10,811,700 bushels. In 1925 the Soviet Republics produced 176,461,400 bushels, the Serb-Croat-Slovene State 149,232,800 bushels, Mexico 73,326,300 bushels and Spain 28,209,900 bushels. Argentina, in the crop year 1925-26, produced 279,516,300 bushels, the largest crop since 1914-15 when the total yield was 325,178,000 bushels. The Union of South Africa, in the 1925-26 crop year, produced 32,325,000 bushels. The Canadian production in 1926 was 6,744,000 bushels.

The 1926 crop of the United States, as estimated by the Department of Agriculture, was

2,645,031,000 bushels produced on 99,492,000 acres, making the average yield per acre 26.6 bushels. In 1925 the total crop was 2,916,961,000 bushels, the area 101,359,000 acres and the average acre yield 28.8 bushels. The average farm price Dec. 1, 1926, was 64.4 cents per bushel, which was 3 cents under the corresponding price the year before. The total value of the crops for the two years on this basis was \$1,703,430,000 and \$1,966,761,000 respectively. The yields of the leading States were reported as follows: Iowa 413,586,000 bushels, Illinois 312,970,000 bushels, Missouri 174,189,000 bushels, Indiana 170,528,000 bushels, Minnesota 147,662,000 bushels, Ohio 145,436,000 bushels, and Nebraska 130,407,000 bushels. Iowa devoted 10,912,000 acres, Illinois 8,946,000 acres, Nebraska 8,716,000 acres and Missouri 6,300,000 acres to the corn crop in 1926. The average farm price Dec. 1, 1926, in the different States ranged from 50 cents per bushel in Indiana to \$1.20 per bushel in Arizona and Nevada. For the year ended June 30, 1926, the United States exported 23,137,000 bushels of corn and 411,000 barrels of corn meal as compared with 8,460,000 bushels and 333,000 barrels the preceding fiscal year.

During the year 1926 the leading producing States had a surplus for which the farmers received an average price of only about 70 cents per bushel, the lowest since 1921 and equivalent to only 45 cents on a pre-war basis. The corn-hog ratio, or the relation of corn prices to hog prices, however, was favorable and those who had hogs to feed could make profitable use of the large corn crop. Corn is not as readily exported as other cereals and usually less than 3 per cent of the crop goes to foreign markets as corn; but more goes in the form of pork and pork products, as nearly 20 per cent of the pork killed under Federal inspection is exported. Ordinarily about 65 per cent of the corn crop is produced in the twelve north central or corn belt States, and it is from about nine of these States that most of the surplus corn of the country is shipped from the county in which it is grown. Most of the remaining 39 States do not produce enough corn to meet their own requirements, which accounts for the wide range in the price of corn in the different States. The demand for American corn in Europe was low during the year, due to liberal supplies of barley and oats on hand and a large surplus of corn, estimated at 167,000,000 bushels, available for export from Argentina.

Studies carried on by the Department of Agriculture indicated an average cost of production for the United States of 69 cents per bushel in 1925. For the years 1922, 1923, and 1924 this cost was 66, 68, and 82 cents per bushel respectively. According to the data reported the average cost of producing a bushel of corn in 1925, in the different groups of States, was as follows: North Atlantic 87 cents, South Atlantic 96 cents, East North Central 56 cents, West North Central 59 cents, South Central 99 cents and Western States 83 cents.

**CORN BORER CONTROL.** The European corn borer situation remained threatening during the year and efforts to prevent or reduce its spread and to work out methods of control were continued. Quarantine measures were strictly enforced and were extended as new areas were found infested. Conditions in the Lake Erie region were worse than the year before and in-

jury to the crop was especially severe in the Province of Ontario. The pest entered new territory during the year by crossing the borders of Indiana and West Virginia and by continuing its spread in earlier infested States. A National Corn Borer Committee was organized to increase the protection of uninfested sections and to further the work of control. An international conference called by this Committee was held Sept. 25, 1926, to inspect areas of infestation and devise research work and quarantine for the control of the insect. At this conference new types of corn harvesters, constructed to cut the stalk at the surface of the soil or to shred the stalks at the time of harvesting for the purpose of eliminating and destroying the borers, were demonstrated. See ENTOMOLOGY, ECONOMIC.

Frost warnings broadcast by the Weather Bureau station in Iowa on September 23 enabled farmers to harvest much of their seed corn the day before the frost occurred. The percentage of immature and frost-damaged ears of corn was large enough, in many sections of the corn belt, to necessitate culling at the time of harvesting. As officially reported, Ira Marshall, a Hardin County, Ohio, farmer who last year produced a world's record corn crop on ten acres, this past year bettered his own record by producing 1686.8 bushels on ten acres, or 168.68 bushels per acre. In an interstate husking contest held at Fremont, Nebraska, Fred Stanek of Iowa took the championship by husking 2121 pounds of corn in one hour and twenty minutes. The sweet corn crop produced for canning in 1926 amounted to 803,000 tons grown on 311,640 acres, the average yield per acre being 2.6 tons.

**CORN BORER, EUROPEAN.** See CORN and also ENTOMOLOGY, ECONOMIC.

**CORNELL UNIVERSITY.** A non-sectarian, co-educational institution of higher education at Ithaca, N. Y.; founded in 1865. There were 5471 students enrolled in the 1926 fall session, distributed as follows: Graduate school, 570; college of arts and sciences, 1979; law, 163; medicine, 264; architecture, 174; engineering, 1122; veterinary medicine, 96; agriculture, 689; home economics, 464. Of these students 1328 were women. For the 1926 summer session there were 2133 students enrolled. The faculty, composed of 1130 members, had 307 professors, 185 assistant professors, 10 lecturers, 409 instructors, and 219 assistants. The productive funds of the institution on June 30, 1926, were \$20,970,886. The income applicable to current expenses of the fiscal year was \$6,685,176. The lands and buildings were valued at \$10,117,457, and the equipment at \$3,859,344. The library contained 780,000 volumes. The George Fisher Baker non-resident lectureship in chemistry, endowed by Mr. Baker with a gift of \$250,000, was inaugurated in the spring semester of 1926 with a course of lectures by Prof. Ernst Cohen of the University of Utrecht; the lecturer for the first semester of 1926-27 was Professor Fritz Paneth of the University of Berlin. President, Livingston Farrand, LL.D.

**CORRUCINI, kô-rôo-ché'né, ROBERT.** An Italian dramatic basso and conductor, died in Portland, Ore., April 30. He was born at Macerata, June 7, 1859, and received his musical education in his native city. After five years as a violinist at the Bologna opera he made his début in Donizetti's *L'Elisir d'Amore* at Tolentino in 1885. He then sang in many opera houses

in Italy, Russia and also in Lisbon and Vienna. In 1906 he came to New York as prompter at Hammerstein's Manhattan Opera House, and subsequently filled positions as chorus-master with various operatic organizations. In 1915 he settled in Portland as a teacher of singing and conductor of the Portland Opera Association.

**COSMIC RAYS.** See **PHYSICS**.

**COSTA RICA**, *k'osta rēk'ā*. A republic of Central America lying between Nicaragua and Panama, and bounded by the Caribbean Sea on the east and the Pacific Ocean on the west. Capital, San José.

**AREA AND POPULATION.** The area is estimated at 23,000 square miles. On Dec. 31, 1924, the population was estimated at 507,193, of whom the greater part were in the provinces of San José and Alajuela. The Indian natives numbered about 3500. In 1924 the movement of population was: Births, 19,672; deaths, 11,344; marriages, 2979. In the same year the immigrants numbered 5186 and the emigrants, 4756. The populations of the larger cities as estimated in 1924 were as follows: San José, 42,112 (with suburbs, 55,206); Alajuela, 13,737; Cartago, 19,376; Heredia, 13,842; Liberia, 2778; Limón, 11,989; and Puntarenas, 5867.

**EDUCATION.** Primary instruction is free and compulsory, and the elementary schools are under local councils but subventioned by the central government. In 1924 there were open 442 elementary schools with 1379 teachers and an enrollment of 35,876. For secondary education there is a lyceum at San José for boys with 355 pupils in 1924, and a college for girls, with 249 pupils. There are colleges at Cartago, Alajuela, and Heredia, together with professional schools of medicine, law, pharmacy, and dentistry.

**PRODUCTION.** The chief occupation is agriculture, but there are large areas not yet cleared that contain valuable cabinet woods. Coffee and bananas are the principal agricultural products. The next industry in importance is gold and silver mining, which is carried on on the Pacific slope. There are also deposits of manganese ore near the Pacific.

**COMMERCE.** The United States Bureau of Foreign and Domestic Commerce reported in November, 1926, that the foreign trade of Costa Rica had been steadily growing since 1916, when it was valued at \$17,725,097. In the abnormal year 1920 it reached a total of \$37,303,548, the highest level yet attained. The value of imports in 1925 was \$13,820,944 and the value of exports, \$16,416,095.

#### COSTA RICAN TRADE, 1921 TO 1925, INCLUSIVE \*

Year	Imports	Exports	Total
1921	\$9,177,802	\$11,883,981	\$21,061,783
1922	8,312,584	14,220,776	22,533,360
1923	9,783,394	12,829,982	22,613,376
1924	12,003,017	16,565,233	28,568,250
1925	13,820,944	16,416,095	30,237,039

\* Values converted from Costa Rican official statistics

The most important national industry is coffee growing. Costa Rica is third in the production of coffee in the Central American republics. In 1925 the country produced 153,520 metric quintals, and in the same year the value of coffee exported was \$8,403,354, which was more than 50 per cent of the exports. The coffee crop for 1926-27 was estimated at about the same as for 1925-26. The banana is next to coffee in importance as an agricultural product. Costa Rica

is the second country of Central America in the growing and exportation of this tropical fruit. The total shipments in 1925 were 8,348,972 stems valued at \$6,261,729. Production has gradually increased in the last five years. Cacao is becoming more important each year as a replacement crop for bananas. In 1925 Costa Rica exported 4,143,650 kilos valued at \$620,224.

#### COSTA RICAN EXPORTS OF PRINCIPAL COMMODITIES

Commodity	1924	1925
Coffee	\$8,427,473	\$8,403,354
Bananas	6,065,401	6,261,729
Cacao	1,090,432	620,224
Gold and silver	672,973	607,099
Woods:		
Cedar	61,564	79,490
Mahogany	22,578	56,704
Sugar	53,001	18,226

**FINANCE.** In relation to the economic situation of the Costa Rican government, the President stated in his message at the opening of Congress, May 1, 1926, that government receipts were 25,781,231 colones in 1925, as compared with 23,259,050 colones the previous year, while expenditures for 1925 were 23,767,550 colones, or 658,132 colones less than the amount allowed by the budget. The President suggested the lessening of the public debt as a means of saving money to be used to better advantage. In 1926 the charge for interest and amortization represented 8,775,648 colones, with relation to a probable fiscal receipt of 24,962,933 colones. In 1925 the disbursements for the same purpose were 9,173,752 colones and the government receipts 25,781,231 colones. Thus of every 2.83 colones which enter the treasury 1 colon passes directly to the creditors of the republic.

**COMMUNICATIONS.** In 1924 there entered the ports of the republic 504 ships of 1,048,262 tons, and there were cleared 489 of 1,033,788 tons. The length of railway mileage in 1925 was 413, of which 81 miles are state owned. A contract for the electrification of the Pacific Railway of Costa Rica by a prominent German electric company was signed July 24, 1926. Following the ratification of the contract by Congress the work was to be started. According to the contract the work is to be completed within thirty months after it has been started, a dam and hydro-electric plant was to be built to furnish power for the railway, and the cost of construction would be financed by the company, which would issue bonds paying 7½ per cent interest, but the sum will ultimately be paid by the government, which will make yearly payments of 720,000 colones over a period of 23 years.

**GOVERNMENT.** The executive power is vested in a President who is elected for four years and who carries on his administration through six secretaries of state appointed by him and responsible to him; legislative power in a chamber of representatives called the Constitutional Congress with 43 deputies elected for four years, one-half retiring every two years. President in 1926, Don Ricardo Jiménez, elected on Dec. 7, 1923; assumed office May 8, 1924, for a period of four years.

On May 14 the press reported that 250 persons were killed and 100 others injured as a result of a wreck on the Costa Rican Railroad. The train was an excursion trip and was occupied largely by members of the farming and laboring classes. A constitutional amendment

affecting elections was passed during the year. The amendment is to the effect that the candidate receiving an absolute majority of the votes cast shall be declared elected President. If no candidate have an absolute majority, then another election shall be held. The election of the President is to be held on the second Sunday in February of the last year of the term of office. No President may be reelected for the following term.

**COTTON.** The cotton crop of the United States for 1926 was the largest ever produced. The Crop Reporting Board of the U. S. Department of Agriculture, on December 8, estimated the crop at 18,618,000 bales of 500 lbs. gross weight. This is an increase of more than 2,400,000 bales over the crop of 1925 and 7,100,000 bales more than the average production for the 5-year period, 1921 to 1925. The area planted to cotton in the United States in 1926 was about 49,000,000 acres, 2.9 per cent of which was abandoned before harvest. The average production of lint per acre was estimated at 187 lbs. as compared with 153.7 lbs. for the 10-year period, 1916 to 1925. Planting conditions were favorable over the entire cotton belt, but cool weather and early drought followed in some regions. After August the crop was favored by warm weather and temperatures continued above normal until late in October. The cotton boll weevil and the cotton flea beetle, while quite generally distributed, caused comparatively little damage. A considerable amount of cotton remained to be ginned at the beginning of December, especially in the western areas, and the total crop will depend on weather conditions, the low price of cotton making it unprofitable to pick low-grade lint. The *Economic Review* says the outstanding feature of the 1926 cotton crop was the greatly enlarged area planted in Texas and Oklahoma, the increase being over 50 per cent in Texas and nearly 70 per cent in Oklahoma. The Bureau of the Census reported ginned on Dec. 13, 1926, 15,542,249 running bales.

**WORLD PRODUCTION.** The world production of cotton for 1926 is believed to be larger than the crop of 1925 when 27,900,000 bales were produced, India being the only country of large production reported with a considerable decrease. Of the world's crop of 1925, according to *Foreign Crops and Markets*, the United States produced 16,104,000 bales of 478 lbs. net weight; India, 4,660,000; China, 2,114,000; Egypt, 1,629,000; Brazil, 793,000; Russia, 737,000; Mexico, 22,000; Peru, 194,000; Uganda, 136,000; Chosen (Korea), 125,000; and Argentina, 67,300 bales.

The accompanying table shows, by States, the cotton crop of the United States for 1925, as reported by the Bureau of the Census, the estimated crop for 1926, and the amount reported as ginned to Dec. 13, 1926:

States	Crop 1925	Estimated crop 1926	Reported ginned December 13, 1926
	500 lb. bales	500 lb. bales	Running bales
United States . . . .	16,108,679	18,618,000	15,542,249
Alabama . . . . .	1,356,719	1,490,000	1,415,000
Arizona . . . . .	118,588	115,000	82,564
Arkansas . . . . .	1,604,628	1,620,000	1,322,054
California . . . . .	121,795	128,000	97,914
Florida . . . . .	38,182	33,000	32,828
Georgia . . . . .	1,163,885	1,475,000	1,366,900
Louisiana . . . . .	910,468	820,000	771,790
Mississippi . . . .	1,990,587	1,980,000	1,647,821

States	Crop 1925	Estimated crop 1926	Reported ginned December 13, 1926
	500 lb. bales	500 lb. bales	Running bales
Missouri . . . . .	294,262	255,000	179,211
New Mexico . . . .	64,444	72,000	53,040
North Carolina . . .	1,101,799	1,250,000	1,081,710
Oklahoma . . . . .	1,691,000	1,950,000	1,229,348
South Carolina . . .	888,666	1,030,000	902,655
Tennessee . . . . .	517,276	475,000	386,431
Texas . . . . .	4,165,374	5,900,000	4,858,287
Virginia . . . . .	52,535	55,000	41,879
All others . . . . .	23,521	20,000	10,314

The table includes 557,729 round bales which are counted as half bales. The crop of Lower California, which is largely marketed through California, was estimated at 80,000 bales.

An important factor in the cotton crop is the seed. Oil mills in the United States for the year ended July 31, 1926, crushed 5,538,937 tons of seed which yielded 1,042,656 bales of lint, 1,611,689,475 lbs. of oil, 2,588,047 tons of cake and meal, and 1,541,397 tons of hulls, besides other products. Exports of domestic cotton and lint for the cotton year, Aug. 1, 1925, to July 31, 1926, were 8,154,370 bales, of which 2,274,758 bales went to the United Kingdom; 918,695 to France; 747,518 to Italy; 1,677,564 to Germany; 1,015,853 to other European countries; and 1,124,853 to Japan. Imports of cotton to the United States during the same period were: From Egypt, 238,620 bales; Peru, 16,637; China, 22,453; Mexico, 23,553; and India, 22,143 bales.

The unusually large world's crop of 1926 and the carry over, which was estimated by the *Commercial and Financial Chronicle* at 7,665,000 bales, depressed the price of cotton in the United States to a very low figure. Various agencies, such as increased activity of cotton mills, larger exports and cooperative marketing, have aided in stabilizing the market. The spot price of cotton quoted by the New York Cotton Exchange on Jan. 5, 1927, was 12.65 cents per pound. This is below the cost of production, which was estimated by *The Analyst* of Nov. 5, 1926, at 17.5 cents a pound. If sold on the basis of the January 5 price farmers would receive from \$550,000,000 to \$600,000,000 less than the crop cost them.

To prevent such ruinous losses the President appointed a commission, headed by Hon. Eugene Meyer, Managing Director of the War Finance Corporation, to aid in working out a plan for the orderly marketing of the crop. Nine cotton finance corporations were organized in various parts of the South, with an aggregate capital of \$16,000,000, and, through the intermediate credit banks, a credit of \$160,000,000, to finance the storage of approximately 4,000,000 bales which are to be held for 18 months or more, or until favorable markets develop. Special efforts were made to induce growers to pool their product and not dump it upon an already demoralized market. The successful carrying out of these plans contemplated a smaller acreage planted to cotton in 1927, and a reduction of 25 per cent was proposed.

The efforts of European countries to increase cotton production in their own or colonial territory were continued. The British Cotton Growing Association considered the most promising countries for developing cotton production within

the British Empire, aside from India, were Uganda, Sudan, and Nigeria. In 1925 exports of cotton from Tanganyika, Uganda, and Nyassaland amounted to 227,404 bales of 400 lbs.; Anglo-Egyptian Sudan, 41,745; and Nigeria, 37,147 bales. The total production of these countries for 1925 was 366,700 bales. The quality of the cotton produced in Uganda and Nigeria is excellent, and in British markets it usually commands a premium of from 3 to 5 cents a pound over American middling. The Makwar Dam in the Sudan was completed in 1925 and gravity water was supplied to 74,000 acres of cotton in the Gezira Plain. It is reported that more than 170,000 acres of cotton were grown under irrigation in the Sudan in 1926, and the production of rain-grown cotton in the southern part of the country would exceed 15,000 bales. In Kenya Province drought, prospective low prices, and native indifference reduced the area planted in 1926. The British Cotton Growing Association claims that there were grown under the auspices of the association in 1925 over 365,000 bales of cotton. Transportation is a limiting factor in developing the cotton industry, and during the year a new branch railroad into Northern Nigeria was completed that will facilitate shipment. Motor transportation is being extensively developed in various African colonies to solve transportation difficulties.

In Queensland, the agreement between the Government and the British-Australian Cotton Association for a guaranteed price for cotton expired July 31, 1926, and a growers' pool was organized to market the crop. An unfavorable season is reported to have caused a reduction in yield. An estimate of the Division of Cotton Culture in Queensland gives the cost of growing and delivering a pound of Queensland cotton to the Liverpool market as 23.18 cents, exclusive of the value of the seed.

The Indian Central Cotton Committee (YEAR BOOK, 1925, p. 182) is continuing its work on marketing, preventing frauds, etc. The Ginning and Pressing Acts have been extended throughout India, and records are now kept of every bale ginned. The importation of American cotton is permitted only through the port of Bombay, where it must be fumigated as a precaution against the introduction of the boll weevil. The Institute of Plant Industry, established at Indore by the Central Cotton Committee, began research work on various cotton problems. The cotton crop of India for 1926 was estimated at about 8.5 per cent less than that of 1925.

The crop in Egypt for 1926 was about 7 per cent less than that of 1925 due, in part, to the restriction placed on planting. An official decree was issued Dec. 19, 1925, restricting planting of cotton to two-thirds of the average area. This was expected to reduce the area planted by 180,000 acres but it came too late to permit changing systems of agriculture for 1926, and the decree was not rigidly enforced. Recent reports announce the decision of the Cabinet to limit for three years the acreage of cotton to two-thirds of the average area. Recent experiments have shown that summer fallowing in Egypt not only increases the yield of cotton but also conserves irrigation water for other crops in the delta region.

Italy was attempting to develop a cotton-growing industry in Italian Somaliland, and in 1926 about 4500 acres were planted to this

crop. Experiments have shown that Sakellarides is the most profitable variety for planting in that country. The cotton production of European and Asiatic Turkey for 1926 is estimated at 134,500 bales, a decided increase. In Greece a crop of 35,000 bales is indicated as compared with 15,000 bales in 1925.

In South America cotton growing was gradually increasing. Brazil showed a reduction in the crop of 1925 over that of the preceding year, and for 1926 an increase was estimated. Argentina was expected to increase its cotton production from about 67,000 bales in 1925 to 146,000 in 1926.

The International Cotton Federation Conference will hold meetings in Egypt from Jan. 24 to Feb. 7, 1927. A Cotton Textile Institute was organized during the year, with headquarters in New York City, to promote the progress and development of the cotton industry through research, the publication of information, and collecting statistical data on all phases of the industry. Walker D. Hines has been chosen President of the Institute. See AGRICULTURE; AGRICULTURAL EXPERIMENT STATIONS; ENTOMOLOGY, ECONOMIC.

**COTTONSEED.** See COTTON.

**COUÉ**, koo'ä, PHILIPPE ÉMILE. A French mental healer and hypnotist, died at Paris, July 2. He was born at Troyes, France, in 1857, but his family removed to Nogent-sur-Seine, where he was educated until he reached the age of fifteen when he attended the Lycée of Troyes. Here he received his degrees in arts and sciences, and after serving in the army for a year was apprenticed to M. Delauney, a druggist of Troyes. Later, receiving a tutorship at the College of St. Barbe, he won a government fellowship, and became subsequently a pharmacist's assistant at the Necker Hospital. Again taking up work in pharmacy in Troyes, Coué acquired the sole control of the druggist business. His attention being directed to the application of hypnotism to healing, he found that he was able to hypnotize people without trouble, and he sought to influence the minds of his subjects to throw off suggestions which affected their health.

Coué's work attracted considerable attention and his well-known phrase, "Every day, in every way, I am growing better and better," secured a wide vogue. Coué was embarrassed by the attention he received, as he did not pretend that his method was a "faith cure" universally applicable, or that it was a substitute for other, and particularly medical, treatment. Nevertheless, it became a fad, and Coué went to London where he gave clinics, which attracted the attention of many people, being received by society and considered a person of importance. In 1923, he came to America where he lectured on his doctrine of psychological treatment and held many clinics. It was Coué's theory that the subconscious mind could direct the diseased organ to do the thing that would make it better, and the object of repeating his formula was to train the subconscious mind in this way. He was said to have been particularly successful with persons who stammered, and with those who did not have full control of their legs and were convinced that they could not walk. He wrote a

volume which described his theories and methods, and this was published under the title of *La Maitrise de soi-même par l'autosuggestion consciente*, and which was translated under the name of, *Self-mastery by Conscious Autosuggestion*. He also published a number of papers in the bulletins of the Lorraine Society of Applied Psychology, of which he was the President.

**COUNTRY LIFE ASSOCIATION.** See AGRICULTURAL EXTENSION WORK.

**COURT TENNIS.** See RACQUETS.

**COWS.** See DAIRYING.

**Craven, Alfred.** American civil engineer, died in Pleasantville, N. J., September 30. He was born at Bound Brook, N. J., Sept. 16, 1846, and graduated from the United States Naval Academy in 1867, but resigned from the service in 1871, when he joined the California geological survey, being engaged in irrigation work in the Sacramento and San Joaquin valleys. He was in private practice as a mining engineer in California and Nevada until 1884, during which time he was connected with the development of the famous Comstock Lode, and design of the Sutro tunnel built to drain some of the deep mines. Returning to the east in 1884, he became division engineer of the new Croton Aqueduct, being in charge of the construction work of the Carmel and Titicaca dams and reservoirs, and in 1895 was in charge of the construction of the Jerome Park Reservoir, in which capacity he served until 1900. He was then appointed division engineer of the Rapid Transit Commission of New York City, being placed in charge of the subway at Forty-second Street and Broadway to One-hundred and Fourth Street. In 1905 he was appointed deputy chief engineer of the Rapid Transit Commission, and in 1907 he was made deputy engineer of subway construction of the Public Service Commission, acting as chief engineer and later as chief engineer in charge of the dual system of subways of New York City from 1910-16.

It was under Craven's administration that the New York dual subway system was in great part brought to completion and in 1916 he retired as chief engineer of the Rapid Transit Commission to become consulting engineer to the Public Service Commission and its successor, the Transit Construction Commission. In 1915 Craven was appointed by the Secretary of the Navy as one of two representatives of the American Society of Civil Engineers on the Naval Consulting Board. In 1920 he retired from active practice as consulting engineer. In 1916 he served as Vice-President of the American Society of Civil Engineers.

**CREAM.** See DAIRYING.

**CRETE.** An island in the Mediterranean Sea, ceded to Greece after Aug. 10, 1913. Area, 3327 square miles; population at the census of 1920, 110,746. Capital, Canea, with a population of 37,425 in 1920.

**CREWS, KRÖÖS, RALPH.** American lawyer, died as the result of an automobile accident near East Moriches, L. I., N. Y., September 6. He was born at Mt. Vernon, Ill., March 29, 1876, and after studying at the Hyde Park High School, Chicago, received the degree of LL.B. from the Chicago College of Law in 1897. Admitted to the Illinois bar in that year, he practiced at Chicago until 1917. In that year he was

commissioned major in the Ordnance Department of the United States Army, being in charge of the contract section of that service, and later special assistant to the Chief of Ordnance at Washington, D. C. He was promoted to lieutenant-colonel and colonel in the Ordnance Department, and was discharged at the conclusion of the War. On January 1 he became a member of the law firm of Sherman & Sterling of New York City, and was a director of the National City Company, the Metropolitan Trust Company, the Old Ben Coal Company of Chicago, the Austin Machinery Company of Chicago, Brokaw & Company, Thomas G. Logan, Inc., the United States Fidelity & Guaranty Company, and other concerns. As a corporation lawyer he represented a number of large interests.

**CRICKET.** There were no international cricket competitions of importance in 1926, the game flourishing principally in Great Britain where the intercounty major title was won by Lancashire and the minor honors went to Durham. England defeated Australia in their annual contest. Cambridge won its usual tilt with Oxford. J. B. Hobbs, called the "Babe Ruth of Cricket," was again the outstanding British player, scoring the highest batting average and the most centuries. The leading bowler was W. R. Rhodes.

In the United States the Crescent Athletic Club won the championship of the New York and New Jersey Cricket Association, Brooklyn finishing second and Manor Field, third. E. G. Hull of Manor Field headed the batting averages. The Brooklyn Cricket Club won the championship of the Metropolitan District League. The competition for the Halifax Cup resulted in a victory for the Merion Cricket Club of Philadelphia.

**CRIME.** Public attention continued focused on the problem of crime during 1926. The National Economic League, in a poll taken among its members, voted lawlessness to be the nation's gravest problem. Other semi-public bodies concerned themselves, not merely with contemplating the seriousness of the crime problem, but with devising plans for its solution; while the public as a whole showed a disposition to shift the problem on to the back of experts, preferably psychologists, who were presumed to have penetrated to the inner springs of human nature. The public also contributed to the agitation for the severer punishment of criminals, and in New York State this bore fruit in the passage of the Baumes Laws. (See below, under *New York*.)

In the midst of the conflicting plans and discussions of criminologists and sociologists, it is necessary to keep two distinct problems in mind. The first is crime as a problem for social administration through punishment, and the second is crime as presenting a problem for spiritual and moral education. People often forget that the interest of the state as it is at present organized is necessarily more in the first than in the second. The state is not in a position to reform souls: it would be satisfied if it can restrain, by a system of rewards and punishments, the outward manifestations of crime. The state need not be spiteful in its punishment, for it must recognize that punishment is not an absolute solution, and furthermore that in so far as it has the power it is not exempt from the duty of moral reform of the criminal.

With these notions in mind it is possible to pick one's way among the literature of the year. It was generally agreed that the greatest need of the United States was a reform of procedure in criminal law. The second greatest need is the collection and proper interpretation of criminal statistics. Both of these needs are independent of theories about moral or psychological reform of the criminal.

**CRIME AND THE LAW.** Chief Justice Taft, back in 1906, had declared that the administration of criminal law in the United States was a disgrace. That this continued to be true was attested by the fact that Harvard University in its endowment campaign for its Law School used this statement in its literature, and continued to use it despite the protest of W. D. Guthrie that it was too sensational.

The Sub-committee on Criminal Procedure and Judicial Administration of the National Crime Commission published in July a list of twenty recommendations. Chief among these were the proposals for the tightening of paroles and for verdicts by five-sixths of the jury in all felonies except those carrying the death penalty. Other recommendations called for public defenders for accused persons without means to hire lawyers; for the questioning of accused persons before a magistrate (and thus obviating third-degree methods by the police); for wider latitude in the judge's instructions to the jury; for the right of the public, as well as of the defense, to object to a particular judge sitting as a trial judge; for joint trials in cases of two or more persons accused of the same crime.

At about the same time the American Bar Association, at its annual meeting, discussed the reform of the administration of criminal law and the changes in legal procedure. Judge Oscar Hallam, of Minnesota, chairman of the section on criminal law, proposed the better administration of existing laws as the best remedy for the wave of crime. He also proposed more publicity at every phase of the administration. He said:

Every step, from detection to ultimate release after fulfillment of sentence, should be open, and the public should be kept advised. The facts should be arrayed, not by sensational methods of the police reporter, but by those of the careful investigator.

Judge Hallam then went on to discuss the definite lines of wholesome procedure that may be established by statutes or rules of court. He said:

- We can eliminate straw bail.
- We can simplify indictments and permit their amendment.
- We can simplify the drawing of juries and improve their personnel by limiting the number of challenges and placing greater power of control in the courts.
- We can permit comment on the failure of the accused to testify in his own behalf.
- We can require a plea of insanity to be made in arraignment, require the commitment of such a defendant for observation by experts, and permit the calling of experts by the court.
- We can shorten the time to appeal; require appeals to be more promptly heard.
- We can provide increased punishment where crime is committed by one in possession of a gun.
- We can permit paroles to be made only after judicial investigation and notice to trial judge and prosecutor.
- We can revise procedure in other ways, speeding trials and eliminating technicalities.

The proposals of Judge Hallam and of the National Crime Commission may be compared with the revision of the New York criminal

statutes which went into effect in the middle of the year. (See below, under *New York*).

Also it should be kept in mind that the revision of legal procedure cannot by itself accomplish much unless it is the result of a new public attitude towards crime. The interlocking of crime with politics, which is a feature of American cities (see below, under *Chicago*), furnishes a ready explanation why the administration of criminal law and legal procedure are in the state that they are. Other and more subtle connections between crime and American life may also be cited to show why the United States gets the sort of lawlessness that conditions invite.

Former Governor Hadley, of Missouri, declared in July that 90 per cent of the persons guilty of major crimes are not apprehended and punished. And of those who are apprehended, he said, about 75 per cent escape the minimum punishment provided by law. Such a state of things is not traceable to any single situation as a defect in legal procedure, but must be held to reflect a more or less fundamental condition of American life, the reform of which can only be slow. The *Independent* remarked in this connection that "while it is important to reform the criminal statutes and hasten judicial procedure, it is even more important to catch the criminals. And at present chasing criminals is more of a game than a science in the United States."

An illuminating discussion of the relation of crime and politics is contained in an article by Prof. Raymond Moley in the *Annals of the Academy of Political and Social Science* (May, 1926, p. 79). Professor Moley traces the influence of the political broker in American machine politics and shows how in all cities the severity of the law is tempered by political influences.

**STATISTICS.** Almost every pronouncement during the year from authorities on criminology stressed the lack of adequate crime statistics in the United States. The lack of a central agency and the lack of competent experts to collate the important facts were the two things universally condemned. There was no standard method of compiling records of crime, and the facts were scattered in the records of city courts and state institutions. The Federal government does not handle any criminal statistics except the figures as to the prison population.

The use of present statistics in order to point with alarm at the crime wave was attacked by Clarence Darrow in an article in *Harper's* (Oct. 1926). Mr. Darrow took as his text the statistics of the Chicago Crime Commission, and seemed to have no trouble in demonstrating that crime statistics have both to be expertly compiled and expertly interpreted in order that they should have scientific weight. He also took occasion to condemn the agitation for severer punishment and insisted that the cure for crime lay in the safeguarding of the early training of our youth.

Dr. F. L. Hoffman, writing in the *Annals of the Academy of Political and Social Science* (May, 1926) also refused to take too seriously the present available crime figures. He said, however, that "homicides are unquestionably on the increase," and that "the present rate of frequency for the United States considerably exceeds that of any other civilized country." He also pointed to the futility of capital punishment as a check on homicide, inasmuch as in New York State out of twenty-one convictions

and death sentences, only four persons were actually electrocuted.

In the same periodical Dr. I. M. Rubinow analyzes the prerequisites for the proper compilation of criminal statistics. Aside from the need of a central bureau with special State bureaus working together—which everyone admits to be necessary—Dr. Rubinow shows the necessity, not of compiling routine figures, but of so framing the statistician's inquiries that the answers will shed scientific light on sociological questions. As he himself puts it,

The things we are looking for or should look for in crime statistics are, in non-technical language, the following: How much crime? What kind of crime? How much of each kind? More or less? What are we doing about crime? What are we doing with the criminals? What are the results of our present methods of treating crime? Why? Why and when is there more or less crime?

A drop in the homicide rate in 1926 was seen by the Metropolitan Life Insurance Company on the basis of the vital statistics of the company's industrial policyholders for eleven months of 1926. The company's reports cover more than 17,000,000 of the population.

The company in its announcement said that murder and manslaughter are still a blot on the good name of America, and that homicides are twelve times more numerous than in England and Wales and five and a half times more numerous than in Canada. According to the company's records, New England has fewer homicides than any other section of the country. Other states with good records are Delaware, Colorado and Oregon.

The homicide rate for the entire country has shown an upward trend in the sixteen years from 1911 to 1926, at the same time that the suicide rate has gone down 50 per cent.

CHICAGO. Chicago has for years had the worst reputation for crime of any American city, but it remained for an organization purporting to represent the city's better element to advertise this year the unsavory situation before the Federal Government at Washington. On February 28, 1926, a petition was presented to the United States Senate on behalf of the Chicago Better Government Association asking for a Federal investigation of the alliance between crime and politics in the city of Chicago. The excuse for a Federal investigation was that the criminal element comprised chiefly aliens, and that the regulation of aliens was a Federal duty under the immigration laws. Another reason for Federal jurisdiction was the intimate connection of the crime-politics alliance with the prohibition situation.

In the absence of the regular Senators from Illinois the petition was presented by Vice-President Dawes. It was referred to the Committee on Immigration, of which Senator Hiram W. Johnson of California was chairman. The committee reported on March 2, declining to undertake any investigations. Nothing concrete came out of the presentation of the petition. None the less the petition, as well as the comments which it aroused, remains a valuable sociological document.

The petition said in part:

For the past four years there has been growing up in this commonwealth a reign of lawlessness and terror, openly defying not only the Constitution and laws of the State of Illinois but the Constitution and laws of the United States as well. The people of this commonwealth

find themselves helpless to combat and change this condition.

There has been for a long time in Chicago a colony of unnaturalized persons hostile to our institutions and laws, who have formed a super-government of their own—feudists, blackhanders, members of the Mafia—who levy tribute upon citizens and enforce collection by terrorizing, kidnapping, and assassinations.

Many of these aliens have become fabulously rich as rum-runners and bootleggers, working in collusion with the police and other officials, building up a monopoly in this unlawful business.

A ring of politicians and public officials, operating through criminals and dummy directors, are conducting a number of breweries and selling beer under police protection. Connivance of city and county law-enforcing officials with the gangsters has fastened a condition in which people of this county find themselves helpless. Five breweries are making and selling pre-Volstead beer openly and under police protection. Evidence multiplies daily that many public officials are in secret alliance with underworld assassins, gunmen, rum-runners, bootleggers, thugs, ballot-box stuffers, and repeaters.

The petition was drafted by the Rev. E. L. Williams and purported to express the sentiments of 200,000 persons. Mr. Williams denied that politicians had a hand in the drafting, and it seemed to be the intention of the petition to attack the local politics of both parties, Republican and Democratic. None the less the entire city administration, including Mayor Dever and State's Attorney R. E. Crowe, denounced the filing of the petition as a calumny on Chicago. Mayor Dever in a public statement denied the charge of an alliance between the Chicago underworld and factional politics, and pointed out that the situation in Chicago was no worse than elsewhere. "Chicago," he said, "needs no outside help to take care of its criminal situation, which, incidentally, I don't believe is any worse than that of any other city in the United States. There is no reason why Chicago's reputation should be bandied about Washington by irresponsible parties."

The filing of the petition was attacked also by Representative A. J. Sabath and other public officials of Illinois and Cook County. All regarded it as in bad taste.

Senator Hiram Johnson, speaking not for the Senate committee but for himself, gave the following as the reason for the rejection of the petition:

Every populous American city has its peculiar local problems. Questions relating to vice conditions, corruption, and the thousand and one things incidental to our cosmopolitan character constantly arise.

For a committee of the Senate, upon a roving commission, to undertake an investigation of these local problems would be, in the absence of an all-compelling Federal question, a subversion of the fundamental principle of self-government. An investigation in reference to one great city would invite similar investigations in reference to many. Unless, therefore, there is something of the most vital consequence to the Government and the administration of Federal laws, it would be, first, an unwarranted interference, and, next, a never-ending work for a Senate committee to undertake an investigation of the internal conditions of our great cities.

It is interesting to note that while the officials of Chicago and Illinois all denied the charges of collusion between government and crime, the newspapers of Chicago published photographs showing the presence of officeholders at a banquet attended by many to whom the newspapers attribute a highly unsavory reputation.

It is also of interest to note that the Senate Committee, while rejecting the petition, did not reject one of the suggestions incorporated in it, namely, the registration of aliens. During the year several proposals were made in Congress

for the registration of aliens, but all were voted down.

NEW YORK. On July 1, 1926, there went into effect in New York State a series of amendments to the criminal code calculated to bring about a stricter prosecution and punishment of crime. The laws were drafted under the leadership of Senator Caleb H. Baumes and are frequently referred to as the Baumes laws. We give below a summary of their provisions as prepared in a statement issued by the Merchants' Association of New York City:

Provision is made for a statewide collection of criminal records, such as finger-prints, Bertillon measurements, etc., by police officers and prison wardens, and the interchange of such information with the Federal authorities and police officers of other States and countries.

The absence or existence of a criminal record must be established before a person charged with a felony or any one of seven specific misdemeanors can be admitted to bail. The court may also use its discretion in refusing bail to a person charged with any one of these misdemeanors.

District attorneys, except in New York County, are required to proceed against the surety in criminal bail bonds within sixty days after the adjournment of the court if the court direct the forfeiture of the bonds, instead of "at any time" as heretofore.

Persons jointly accused may hereafter be tried separately or jointly in the discretion of the court.

A defendant in a criminal case must file appeal within thirty days, instead of one year as formerly, and appeals must be argued within ninety days, unless the time is extended by the court, and, except in instances where the Appellate Court is overruled, there shall be but one appeal.

The sentences of judges will hereafter be carried out as imposed. The amendment, by abolishing compensation and reducing the time granted for commutation, through the substitution of a new form of commutation limited to five days a month, will have the effect of increasing definite sentences by from 16 to 60 per cent. Commutation and compensation in the case of life sentences will hereafter be abolished.

The actual term of imprisonment in a State prison will in future be no less than one year, and this term may not be reduced.

The statutory sentence for felony shall be increased, when committed by armed persons, from five years in case of a first offender to twenty years or even life in case of a fourth offender. And such armed persons, even when first offenders, may not be released on probation, or otherwise have their sentences shortened.

The penalty for burglary in the first degree shall be not less than fifteen years; for robbery in the first degree, from fifteen to twenty years. A life sentence, in future, will not mean a minimum of ten years or an indeterminate sentence; it will mean a life sentence.

Persons convicted for the fourth time of felony must hereafter serve a life sentence. Persons originally sentenced as first offenders may be resented if it is discovered they have previously been convicted.

The receiving of stolen property in any amount is now a felony, with the maximum penalty increased to twenty years imprisonment.

The operation of the Baumes laws, as tested out in the six months between July 1 and Dec. 31, 1926, was greeted with mingled comments. Police officials generally praised the laws and declared that they were having a marked effect in checking the crime wave. Police Commissioner McLaughlin of New York City, in a statement at the close of the year, said that in the greater city major crimes committed in 1926 were 60 per cent fewer than in 1925, and also fewer than in any year since 1922. A decrease was shown for every month on 1926, but particularly since July, when the Baumes laws went into effect, the Commissioner added.

On the other hand some district attorneys and a number of judges protested against the removal of judicial discretion in the sentencing of prisoners. The law providing for a life sentence in the case of fourth offenders was par-

ticularly criticized. It was pointed out that a man may be technically in the class of fourth offenders without deserving morally to be ranked with incurable criminals. The following editorial comment from the *New York World* (under date of November 19) sums up this type of criticism:

Under the law as it now stands the judge has no discretion. He must sentence to life imprisonment on a fourth conviction. It makes no difference whether the defendant is a petty offender or a violent thug. The first effect of such a law is to provoke strong dissent in the minds of district attorneys and judges who have to administer it. Another effect, already clearly indicated, is that no man will ever again plead guilty if he is a fourth offender. It would do him no good. He could expect no mercy in return for saving the State the trouble and expense of a trial. He will naturally gamble for an acquittal. It will be a good gamble too. It is hardly likely that the average New York jury would convict if there were any conceivable doubt or mitigating circumstance once it knew that conviction for a relatively minor offense meant life imprisonment. We already know from our experience in capital cases how difficult it is to persuade a modern jury to vote away the life of a man even if he is a murderer.

The law, it went on to say, "seems to suffer from two defects; being too severe, and therefore against the conscience of the community, it is very difficult to enforce; being mandatory, it deprives officers of the law of a wise discretion which must apparently always be part of a good system of law."

Appeals to test the validity of the Baumes laws were brought by a number of convicted prisoners and by District Attorney Dodd of Brooklyn. The District Attorney sought to compel County Judge Franklin Taylor to resentence for life imprisonment a prisoner who had been allowed to go through as a first offender. The Judge had at the time pointed out that inasmuch as the prisoner had entered a plea of guilty on the understanding that he would be sentenced as a first offender, the Court could not in all fairness break the bargain and sentence him as a fourth offender. Nonetheless, the Supreme Court Appellate Division upheld the District Attorney as against Judge Taylor. The case was scheduled to go to the Court of Appeals for final adjudication.

In the meantime the Baumes Crime Commission met and considered new changes in the State criminal code, and tentatively agreed upon three new provisions designed to reorganize the parole system. The 1926 Baumes laws were to stand untouched. The new proposals besides reorganizing the Parole Board would deprive the judge of the power to designate the prison at which the convict is to serve. See *PSYCHOLOGY* under *Abnormal Psychology*.

**CRIMINAL COURT.** INTERNATIONAL. See INTERNATIONAL CRIMINAL COURT.

**CRITICISM.** See LITERATURE, ENGLISH AND AMERICAN; FRENCH LITERATURE; GERMAN LITERATURE; SCANDINAVIAN LITERATURE; SPANISH LITERATURE; ETC.

**CROATIA, kro-a'-shi-a, AND SLAVONIA.** Since 1918 a province of the new state of Jugoslavia (q.v.); formerly a crownland of the Austro-Hungarian Empire, extending from the Adriatic Sea to the Danube River. Area, Jan. 31, 1921, 16,920 square miles; population at the same date, 2,739,593. Capital, Zagr b (also known as Agram), with a population in 1921 of 108,338.

**CROPS.** See AGRICULTURE; also special articles as COTTON, WHEAT, ETC.

**CROSS, MRS. GEORGE FREDERICK.** See CAMBRIDGE, ADA.

**CROSS COUNTRY RUNNING.** The national senior Amateur Athletic Union cross country run of 6¼ miles, held at Van Cortlandt Park, New York City, was won by Willie Ritola, Finnish-American A. C., for the fourth time, with Philop Osif, Haskell Institute, second, and Gus Moore, St. Bonaventure College, third. The team trophy for the third year in a row went to the Finnish-Americans, St. Bonaventure College finishing second and Dorchester Club, third. Ritola also captured the annual ten-mile run for the fourth time.

The intercollegiate cross country championship was won by Penn State College, W. J. Cox of Penn State being the individual victor. Cox's time for the six miles was 30 minutes, 4 seconds. The team scores of the first five colleges entered were: Penn State, 65; Syracuse, 68; Yale, 95; Harvard, 102; Massachusetts Institute of Technology, 145.

The National Amateur Athletic Union Marathon championship was won by C. Miles, his time being 2 hours, 25 minutes, 40½ seconds. A. Sternoos finished second and Clarence De Mar, winner of this event in 1922, 1923, and 1924 took third place. The Marathon held in connection with the Philadelphia Sesqui-centennial was won by De Mar with Michelson second and Wendling third. De Mar also captured the New York-to-Portchester Marathon.

**CRUISERS.** See VESSELS, NAVAL; NAVAL PROGRESS.

**CRUSTACEA.** See ZOÖLOGY.

**CUBA.** A republic of the West Indies consisting of the large island of the same name, the Isle of Pines, and small adjacent islands. Capital, Havana.

**AREA AND POPULATION.** The area is 44,164 square miles of which 41,634 are for the island of Cuba, 1180 for the Isle of Pines, and 2350 for the other islands. According to figures furnished by the Director of the Census Bureau the population of Cuba on April 30, 1926, was 3,350,026 inhabitants, distributed as follows:

	<i>Inhabitants</i>
Pinar del Rio .....	280,831
Habana .....	922,433
Matanzas .....	335,080
Santa Clara .....	719,263
Camagüey .....	245,042
Oriente .....	847,877

sitory immigration yearly consisting largely of Spanish laborers who return to Spain after the harvest season.

**EDUCATION.** Education is free and compulsory between the ages of six and 18. The public system was developed under American supervision after the passage of the Education Act of 1899. During 1924-25 the total number of school buildings in use was 3627, housing 6665 grades. The total school registration amounted to 388,349, and the average attendance was 71.83 per cent; 6898 regular teachers were employed, while 75 traveling teachers, working in 78 zones, served 174 groups of children who could not attend the regular schools. The enrollment in these groups was about 3900. In 73 night schools there were 5921 students. In the penal establishments of the republic there were five centres of primary instruction with an enrollment of 429. The 575 private schools, having a total of 1712 grades, employed 1956 teachers and had an enrollment of 38,064 pupils and an average attendance of 86.53 per cent. There is a special institute for advanced instruction in each province, and annexed to each is a normal school for the training of teachers. University instruction is provided by the University of Havana which was founded in 1721.

**PRODUCTION.** Sugar and tobacco are the staple products, but cacao, cereals, coffee, potatoes, and fruits are also raised. Cuba is the largest producer of sugar (q.v.) in the world, or nearly 4,000,000 tons per year. The agricultural activities of the inhabitants are consequently largely concentrated on this crop; 80 per cent of the sugar crop is shipped to the United States. The total production of the 1925-26 crop was 4,879,900 tons. A law was promulgated on May 3, 1926, controlling sugar production. This law forbids planters, during the years 1926, 1927, and 1928, to commence any operations of cutting or grinding sugarcane previous to the dates which the chief executive shall designate after consideration of the best interests of the industry and the climatic conditions of the various provinces. Planters grinding cane previous to the dates designated by the president shall be fined 5 pesos for every sack of sugar produced.

**COMMERCE.** According to the United States Bureau of Foreign and Domestic Commerce, the foreign trade of Cuba in 1925 amounted to \$648,145,812, a decline of 10.7 per cent from the \$725,238,077 in 1924. Imports accounted for \$295,040,125, an increase of 1 per cent, and ex-

#### CUBAN IMPORTATIONS

<b>Total .....</b>	<b>\$290,372,782</b>	<b>\$295,040,125</b>	<b>+ \$4,667,343</b>

The city of Havana had 565,282 inhabitants, being the only city in the republic whose population was over 100,000. Other important cities are Cienfuegos, 72,919; Camagüey, 92,073; Manzanillo, 60,544; Santiago de Cuba, 73,800; Guantánamo, 52,598; Santa Clara, 69,200; and Sancti Spiritus, 86,418. There is a large tran-

ports which were \$353,105,887, decreased 18.8 per cent from the total of \$423,865,295 for 1924.

Cuban imports from the United States declined in 1925, by \$6,495,564 or 3.4 per cent. Other decreases were United Kingdom, 3.1 per cent; Germany, 5 per cent; and Spain, 11 per cent. The only gain was in the trade with

France, from which imports increased 19.1 per cent. The following table shows the value of Cuban exports in 1924 and 1925:

CUBAN EXPORTATIONS

Countries of destination	1924	1925	Increase or decrease
United States .....	\$862,264,908	\$262,613,978	- \$99,650,980
Other American countries .....	8,767,138	13,402,902	+ 4,635,764
Germany .....	1,712,724	2,187,053	+ 474,329
Spain .....	1,850,419	1,872,216	+ 591,797
France .....	4,248,900	5,848,345	+ 1,599,445
United Kingdom .....	49,261,954	56,222,039	+ 6,960,085
Other European countries .....	5,249,627	6,865,535	+ 1,615,908
All other countries .....	2,009,625	4,083,619	+ 2,083,994
<b>Total .....</b>	<b>\$434,865,295</b>	<b>\$353,105,687</b>	<b>+ \$81,759,608</b>

Cuban exports to the United States decreased 27.6 per cent, reflecting the low sugar prices, while increases were registered by France, 37.6 per cent; United Kingdom, 14.1 per cent; and Spain, 38.6 per cent. The increase in exports to the European countries was due to increased purchases of Cuban sugar during 1925.

**FINANCE.** The state budget for the fiscal year beginning July 1, 1926, as signed by the president on June 28, 1926, provides for estimated revenues of \$86,733,100 and expenditure of \$86,143,182. A summary of the chief items in the budget is given below:

<b>Revenues (including sums set aside for the fixed budget):</b>	
Customs revenue .....	\$44,611,000
Port fees and improvements .....	1,900,000
Consular revenue .....	1,600,000
Postal and telegraph revenue .....	3,198,500
Internal revenue .....	25,103,600
National lottery .....	4,820,000
Special loan tax .....	5,500,000
<b>Total revenue .....</b>	<b>86,733,100</b>
<b>Expenditures:</b>	
Fixed obligations .....	17,463,314
<b>Administration—</b>	
Executive offices .....	481,520
State department .....	1,842,693
Department of justice .....	373,020
Department of the interior .....	4,950,063
Treasury department .....	4,497,274
Treasury department, additional .....	3,981,304
Department of agriculture, commerce, and labor .....	1,086,899
Department of public works .....	4,096,280
Department of public instruction and fine arts .....	15,381,968
Department of sanitation and charities .....	5,446,259
War and navy department .....	12,482,948
Department of communications .....	5,423,697
Special veterans' fund .....	5,332,132
Port dredging .....	1,262,385
Special public works fund .....	2,041,426
<b>Total administration .....</b>	<b>68,679,868</b>
<b>Total expenditures .....</b>	<b>86,143,182</b>

A comparison of the budget of 1926-27 with that of 1925-26 discloses an increase in both expenditures and estimated receipts of approximately \$2,000,000.

**COMMUNICATIONS.** There were in Cuba 3246 miles of steam railways, all of which were owned and operated by private corporations. There were also 250 miles of electric railways, similarly owned and operated.

**GOVERNMENT.** Executive power is vested in a president and cabinet, and legislative power in a congress of two houses, viz., a senate with 24 members and a house of representatives with 116 members. President in 1926, Gen. Gerardo Machado.

**HISTORY.** The year was a comparatively uneventful one in Cuban history. In January a treaty was signed with the United States pro-

viding for the extension of the existing extradition treaty to crimes such as violations of the narcotic, customs, bankruptcy, and suspension of payment laws, as well as for certain immoral crimes. In March another treaty was signed between the two countries which was designed to prevent smuggling operations. It provided for the exchange of information regarding persons engaged in the violation of the other country's laws; for cooperation to prevent the illegal entry and departure of aliens, in the suppression of the narcotic trade, and in the prevention of smuggling of all kinds.

On April 10 a mild panic was caused by a run on the Royal Bank of Canada due to the publication in certain newspapers, hostile to foreign banking influences, of reports of its insolvency. Government officials and American and Canadian banks promptly came to the assistance of the institution and in a few days the banking situation had returned to normalcy.

A serious railway strike occurred in the month of May. The day after it broke out President Machado stated that it was called in violation of promises given to him by the railway brotherhood. He gave the strikers 72 hours in which to return to work. In the Havana district his proclamation had effect, but in the Camagney and Oriente districts the strike was prolonged throughout the entire month and the president was forced to proclaim martial law. Rioting and bomb-throwing were prevalent in these districts.

On November 17 Carlos Manuel de Cespedes resigned as secretary of state and became Cuban Minister at Paris. He was succeeded by Rafael Martinez Ortiz, who retired as Minister to Paris. On the same day Colonel Orestes Ferrara was appointed Cuban Ambassador to the United States to succeed Dr. Rafael Aballi, who resigned.

**CULTURES.** See ANTHROPOLOGY.

**CUMBERLAND PRESBYTERIAN CHURCH.** A branch of the Presbyterian Church, originally the Cumberland Presbytery of Kentucky. It was formed in 1810, when the so-called anti-revival party of the church objected to the admission into the ministry of men who were not up to the usual literary and theological standard, and also to the doctrine of fatality as taught in the third and tenth chapters of the Westminster Confession of Faith. Its chief strength was in the Southern States, in consequence of which it was barely saved from disunion during the slavery dispute at the time of the Civil War. This situation led to the establishment of the Colored Cumberland Presbyterian Church (see below). A General Assembly which meets annually is the supreme

judiciary. In 1926 the denomination comprised 11 synods and 64 presbyteries, and there were 1228 churches, 763 ministers, and a church membership of 65,876. The property was valued at \$2,951,065, not including \$500,000 endowment for education. There were 1400 Sunday schools, with an enrollment of 48,000. Missionary work was carried on chiefly among the Indians in the United States, but churches were also maintained in China. The educational work of the denomination was conducted by the Board of Education. The denomination maintains Bethel College and the Cumberland Presbyterian Theological Seminary, both at McKenzie, Tenn. The *Cumberland Presbyterian*, published at Nashville, is the official organ of the church. The 1926 National Meeting was held at Columbus, Miss., and it was planned to hold that of 1927 at Lakeland, Fla., May 19-21. The Rev. I. K. Floyd, Dallas, Texas, was moderator of the General Assembly, and the Rev. D. W. Fooks, Nashville, Tenn., was stated clerk and treasurer.

**CUMBERLAND PRESBYTERIAN CHURCH, COLORED.** A branch of the Cumberland Presbyterian Church which was legally set apart as a separate unity in 1869. In 1926 it comprised 18 presbyteries and four synods: Alabama, Kentucky, Tennessee, and Texas. In this year there were approximately 181 churches; 135 ministers; a church membership of 12,000; 190 Sunday schools, with a Sunday school enrollment of 9250. The 52d General Assembly of the Church was held at Huntsville, Ala., May 20-23, 1926. The Rev. D. S. Robinson served as moderator; Elder G. W. Sadler, Waco, Texas, was stated clerk. It was decided to hold the 53d General Assembly at Sweet Water, Tenn., on May 19, 1927. The *Cumberland Flag* is the official organ of the Church.

**CUMMINS, ALBERT BAIRD.** United States Senator from Iowa, died at Des Moines, Iowa, July 30. He was born near Carmichaels, Pa., Feb. 18, 1850, and was educated at Waynesburg College, later studying surveying and becoming assistant chief engineer of the Cincinnati, Richmond and Ft. Wayne Railroad. He studied law in Chicago, and in 1875 was admitted to the Illinois bar, practicing in Chicago from 1875-88 when he removed to Des Moines, Iowa. He served for a time as a railroad attorney in that city, and in 1888 was elected a member of the Iowa House of Representatives. In 1892 he was presidential elector-at-large, and from 1896-1900 he was a member of the Republican National Committee. He was a candidate for United States senator in 1894 and 1900, and was chairman of the Republican State Convention in 1892 and 1896. He was a delegate to the Republican National Conventions in 1892, 1896, 1900, 1904, and served as governor of Iowa for three terms from 1902-08. In the latter year he entered the Senate of the United States, being elected on November 24 to fill the unexpired term of Senator Allison, and he was reelected for the terms 1909-15, 1915-21, and 1921-27.

Senator Cummins was mentioned as a candidate for the presidency at the Republican National Convention in 1912, at which he denounced the action of the majority of the delegates in renominating Taft for whom he declared he would not vote because of the means used in bringing about his nomination. Nevertheless, he was not actually affiliated with the Progressive Party and the revolt organized by

Colonel Roosevelt, though he was in favor of many of the principles advocated by the ex-president. When Vice-President Coolidge became president in August, 1923, on the death of President Harding, Senator Cummins became president of the Senate and held that office until the election of Vice-President Dawes. He was chairman of the Senate Judiciary Committee and had been former chairman of the Senate Interstate Commerce Committee. At the Iowa Republican primary in the spring of 1926, Senator Cummins was defeated by S. W. Brookhart in the course of a bitter three-cornered fight, in which Senator Cummins endorsed every policy of the national administration excepting its attitude in the matter of farm relief.

Senator Cummins was active in political affairs from the time he removed to Iowa, and when he was elected to the Legislature he ran as an independent with the Democratic endorsement, opposing prohibition and contending that it would ruin the Republican Party in that State. He was active in preparing legislation that removed the State from the list of prohibition States and restored it to the Republican Party. In 1894 and in 1900, when unsuccessful as a candidate for the United States Senate, his defeat was accounted for by the hostility of the railroad interests, for in the State Legislature he had supported a measure to prevent railroads from escaping liability for injury to employees. Owing to his early training he was interested in legislation affecting railways, and he was chairman of the Senate Committee on Interstate Commerce in 1919 when the Transportation Act of 1920, or the Each-Cummins bill, was passed under which the roads were returned to private operation after the War period of government control. It was stated that, as a result of his authorship of the Transportation Act, the Republican "insurgent" group in the Senate insisted that he should be removed from the chairmanship of the Interstate Commerce Committee in 1923.

**CUNLIFFE-OWEN, PHILIP FREDERICK.** Editor and author, died in New York, June 30. He was born in London, Jan. 30, 1855, the son of Sir Philip and Lady Cunliffe-Owen, the latter being the Baroness von Reitzenstein. He was educated in England and at the University of Lausanne, Switzerland, and coming to America in 1889 became foreign editor of the *New York Tribune*, holding this position until 1898 when he became society editor. He held this position until 1913, when he severed his connection with the paper and devoted himself to miscellaneous writing. He possessed an intimate knowledge of European nobility, and contributed syndicate articles which were widely published under his pen name "La Marquise de Fontenoy." He also wrote extensively on European politics, which he knew intimately and accurately, using in addition to the pen name above that of "Ex-Attaché" and "Veteran Diplomat." He was honored by many nations, counting among his decorations the Star of Grand Officer of the Greek Order of the Redeemer, conferred by King Alexander of Greece; Officer of the Legion of Honor awarded him by President Poincaré of France; Commander of the Order of the British Empire, bestowed by King George; and other decorations such as Grand Officer (with star), Order of Charles III of Spain; that of Osmanieh, Turkey; Commander, Order of the Crown of Italy;

l'Instruction Publique, France; and Orange-Nassau, Netherlands. Few special writers were better known in the American press than Frederick Cunliffe-Owen, and he enjoyed the acquaintance of many distinguished diplomats and others.

**CURAÇAO**, kōō'rā-sā'ō. A Dutch colony in the West Indies consisting of two groups of islands about 500 miles apart, one of them comprising the islands of Curaçao, Bonaire, and Aruba, and the other consisting of the southern part of St. Martin (the northern part belongs to France), St. Eustache, and Saba. Area, 403 square miles; population, Dec. 31, 1924, 56,522, of whom 35,062 were on the island of Curaçao. The capital is Willemstad, on the island of Curaçao, with a population of 15,775. In 1924 there were 50,504 Roman Catholics, 5306 Protestants, and 543 Jews. The movement of population in 1924 was: Births, 1449; deaths, 1076; marriages, 323. In the same year there were 44 schools with 8037 pupils. The chief products of the colony are maize, beans, pulse, cattle, salt, and phosphate of lime. The chief industry is oil-refining. The crude oil is imported from Venezuela and Mexico. In 1924 the imports were valued at 51,189,100 guilders and the exports, 32,179,265 guilders; 4874 vessels of 7,703,852 net tons entered the ports of the colony in 1924. In 1926 the budget revenue was estimated at 2,357,600 guilders and the expenditure at 2,720,329 guilders. The difference is made up by the mother country. The colony is administered by a governor aided by a council and a colonial council, the members of both being nominated by the sovereign.

**CURRENCY.** See COINS, VALUE OF FOREIGN; FINANCIAL REVIEW; UNITED STATES.

**CUSHNY**, ARTHUR ROBERTSON. British pharmacologist, professor in materia medica and pharmacology at the University of Edinburgh, died at Edinburgh, February 25. He was born at Speymouth, Morayshire, in 1866, and was educated at the University of Aberdeen from which he was graduated in arts and medicine in 1889. He was Thompson fellow in the same year and studied at Berne and Strassburg. He was assistant to the professor of pharmacology at the latter university in 1892-93. In the latter year he went to the University of Michigan at Ann Arbor as professor of pharmacology, and in 1905 was called to the chair of pharmacology and materia medica at the University of London, University College. This place he filled until 1918 when he went to the University of Edinburgh. He was a member of the royal commission on whisky and other potable spirits in 1908. His publications include: *Textbook of Pharmacology and Therapeutics* (1916); *The Secretion of the Urine* (1917); in addition to many papers in the *Journal of Physiology* and elsewhere. He was one of the pioneer workers in this field, to develop the science of pharmacology as a branch of medical science out of what was previously known as materia medica, and his textbook served as a standard work of reference.

**CYCLING.** Cycling enjoyed a banner season in 1926, the New York and Newark Velodromes being crowded to capacity on many occasions when especially attractive programmes were offered. Reggie McNamara proved to be the outstanding rider of the year, winning three six-day races, one in Chicago and two in Madison

Square Garden, New York. In the first grind McNamara was teamed with Bobby Walthour, in the second with Franco Georgetti and in the third with Pietro Linari. McNamara and Linari established a new record of 304 stolen laps in the race they won in the Garden in December.

Willie Spencer captured the American professional sprint championship by scoring the most points in a series of races held at the Newark and New York Velodromes. Cecil Walker of Australia retained his all-around championship.

The American amateur championship went to William Coles of Brantford, Ontario, Canada, the first foreign rider to win this title. Edward Merkner of Chicago captured the amateur road championship.

**CYPRUS.** A British island, situated 40 miles from the coast of Asia Minor and 60 from the coast of Syria; the third largest island in the Mediterranean Sea. Area, 3584 square miles; population, according to the census of 1921 310,709, of whom 61,422 were Mohammedans. Capital, Nicosia, with a population of 18,461. In 1924 there were 821 elementary schools with 1151 teachers and an enrollment of 47,221, of whom 37,177 were Greek-Christian. With about one-third of the arable land under cultivation, agriculture forms the chief occupation of the people of the island. Forestry and the cultivation of the vine are rapidly taking an important place in the production of wealth on the island. Among the principal agricultural products are wheat, barley, oats, potatoes, linseed, cotton, animal products and fruit. Asbestos and copper are mined and exported in considerable quantities.

The merchandise imported in 1924 was valued at £1,243,356; exported, £1,271,339. The revenue for the same year was £593,318 and the expenditure, £535,870. The total shipping which entered and cleared amounted to 1,121,228 tons. The island was administered under a convention with Turkey by Great Britain after June 4, 1878, and was annexed by Great Britain at the outbreak of the war with Turkey on Nov. 5, 1914, and is under a high commissioner having the usual powers of a colonial governor, aided by an executive council and a legislative council of 24 members of whom 9 are office-holders and the remainder elected for five years, 12 of them by non-Mohammedan voters and three by Mohammedan voters. High Commissioner at the beginning of 1926, Sir Malcolm Stevenson.

**CYRENAICA.** A colony belonging to Italy on the north coast of Africa; until 1919 it formed a part of Libya; in that year for administrative and military purposes, Libya was divided up into Cyrenaica and Tripolitania (q.v.). The area is estimated at about 230,000 square miles; population, according to the census of 1921, about 220,000 natives, and 9719 Europeans (9402 Italians). Benghazi is the principal town with a population of 30,000. The chief occupation of the people is agriculture, although there are vast possibilities for cattle raising. Barley and wheat are the chief products. The former is the chief food of the people. In 1923 the imports were 70,811,245 lire and the exports 17,608,774 lire. The principal imports are cotton goods and sugar and the principal exports, sponges and barley (7,430,623 lire in 1924). The internal commerce consists mainly

of caravan trade between Benghazi and Wadi. For 1925-26 the revenue and expenditure were estimated at: Colonial revenue, 161,825,000 lire; civil expenditure, 53,000,000 lire; military expenditure, 108,825,000 lire. Governor at the beginning of 1926, Gen. Ernesto Mombelli (appointed May 4, 1924).

**CZECHO-SLOVAKIA**, *chěko-slovā'kia*. An eastern European republic, formed Oct. 28, 1918, out of the Slav regions of the old Austro-Hungarian Empire: formally designated a republic, Nov. 14, 1918; comprising the former Austro-Hungarian provinces of Bohemia and Moravia, Silesia, Slovakia, and Ruthenia, together with the portion of the Teschen district assigned to Czecho-Slovakia at the Ambassadors' Conference, July 28, 1920. Capital, Prague.

**AREA AND POPULATION.** The total area of Czecho-Slovakia is 54,207 square miles. The population at the census of Feb. 15, 1921, was 13,613,172. By race it was distributed as follows: Czecho-Slovaks, 8,760,937 (65.5 per cent); Germans, 3,123,568 (23.3 per cent); Magyars, 745,431 (5.5 per cent); Russians, 461,849 (3.4 per cent); Jews, 180,855 (1.3 per cent); Poles, 75,853 (0.5 per cent); others, 25,871 (0.2 per cent). There were besides 238,808 aliens. The Czecho-Slovaks and Germans made up almost exclusively the population of Bohemia and Moravia, and the Czecho-Slovaks about half of Silesia and more than two-thirds of Slovakia. The largest cities with their populations in 1921 are: Prague, 676,657; Brno, 221,758; Ostrava, 113,709; and Bratislava, 93,189. The majority of the people are Roman Catholics, who numbered 10,383,833 in 1921.

**EDUCATION.** Elementary instruction is compulsory between the ages of six and 14. In the school year 1923-24 there were 13,904 public and private elementary schools with 810,648 boys and 831,494 girls and 1665 public and private higher grade schools with 167,808 boys and 145,931 girls. During 1924-25 there were 386 secondary Latin and technical schools with 114,493 pupils; during the same year 1924-25 the public or state-aided schools of commerce numbered 157 with 28,524 pupils. There are four universities as follows: Prague (Czech), with 8160 students in 1923-24; Prague (German), with 3250 students; Brno (Czecho), with 1611 students; and Bratislava (Slovak), with 1057 students.

**PRODUCTION.** The Czecho-slovak soil is one of the richest in Europe, both as regards natural resources and industrial and agricultural development. Agriculture has reached a high stage and is intensively carried on. The area and yield of crops in 1924 and 1925 are shown in the following table from the *Statesman's Year Book* for 1926:

Crops	Area in acres		Yield in metric tons	
	1924	1925	1924	1925
Wheat . . . .	1,499,523	1,528,774	877,379	995,371
Rye . . . . .	2,078,107	2,093,087	1,136,323	1,355,575
Barley . . . .	1,678,213	1,715,272	970,696	1,130,702
Oats . . . . .	2,091,898	2,070,671	1,204,157	1,169,179
Potatoes . . .	1,567,972	1,580,402	6,514,326	7,803,728
Sugar-beet . .	747,955	759,731	8,374,443	.....
Malze . . . .	888,593	887,335	260,092	278,812

The number of livestock at the census of 1921 was: Cattle, 4,370,765; horses, 590,687; pigs, 2,052,687; sheep, 985,526; and goats, 1,220,752.

In 1924, the fruits yield was 239,348 tons of apples, 151,918 tons of pears, and 324,952 tons of stone fruit. Mineral products include soft and hard coal, iron, graphite, gold, silver, lead, rock salt, and garnets. The coal production in 1924 was 20,507,178 tons of lignite and 14,359,401 tons of anthracite. On Jan. 1, 1925, there were 332 coal mines, employing 117,953 persons. In 1923, there were 11,316 factories distributed as follows: Textile mills, 2004; glass works and stone factories, 2064; food production factories, 1855; furniture and bent wood manufacture, 1261; machine factories, 812; metal manufactures, 848; paper mills, 348; and chemical factories, 633.

**COMMERCE.** According to the United States Bureau of Foreign and Domestic Commerce, the figures for the foreign trade of Czecho-Slovakia in 1925 showed a substantial increase over the preceding year, and a favorable balance of \$36,200,000 as compared with \$35,200,000. In view of unfavorable conditions during the last quarter of the year in the foreign markets upon which Czecho-Slovakia is principally dependent, the total trade turnover of \$1,091,790,000 as compared with \$986,940,000 for 1924 was particularly favorable. The country was considerably handicapped in building up a favorable trade balance during 1925 by the low world price for sugar, an extremely important factor in its foreign trade.

Imports in 1925 were valued at a total of \$527,800,000 and showed a gain of \$51,900,000 or 11 per cent, over 1924. All classes of goods shared in this increase except cotton goods and yarn, livestock, and fats and greases, which diminished. Similarly in the number of pieces imported there was an increase of 23 per cent. The largest single item of imports was cotton, amounting in 1925 to \$83,900,000, or 17 per cent over 1924. The source of imports is obscured by the fact that Czecho-Slovakia is an inland country, with no ocean ports; as much of its commerce has to be carried on indirectly, imports are credited to Germany and other neighboring countries through which the business is transacted. In the official statistics for 1924, Germany is credited with 35 per cent of the imports, Austria, with 8 per cent, Italy, with 6 per cent, and the United States, with 5.6 per cent.

Exports in 1925 were valued at \$564,000,000, an increase of 10 per cent over 1924. All classes of goods shared in the increase, except sugar, cotton, fuels, machinery and apparatus, and fruits and vegetables. The weight of exports diminished by 2 per cent while the number of pieces increased by 8 per cent. The largest single item of exports is cotton goods and yarn, valued in 1925 at \$95,100,000 as against \$75,200,000 in 1924, an increase of 26 per cent. Sugar exports were valued at \$69,700,000 as against \$73,000,000 in 1924. In 1925 the chief customers of Czecho-Slovakia in order of importance were Germany, Austria, Great Britain, Hungary, and other adjacent countries. The United States ranked seventh.

**FINANCE.** The total revenue estimate for the year 1926 was 10,085,752 crowns and the expenditure estimate, 10,070,271 crowns, as compared with 9,301,334 crowns and 9,573,586 crowns, respectively, in 1925. The internal debt on June 30, 1926, according to figures given out by the ministry of finance, amounted to 22,628,-

710,078 paper crowns and its foreign loans totaled 6,962,479,078 paper crowns. In addition there is the debt imposed by the treaties of peace, amounting to 1,401,280,330 paper crowns, which brings the total to 30,992,470,183 paper crowns (approximately \$915,500,000). During 1925 and the first half of 1926 considerable progress was made in the financial consolidation of the republic. The major operations of the government toward this end have followed three lines—the refunding of short-term treasury certificates, the funding of the debt to the United States, and the conversion of the old Austro-Hungarian railway obligations.

One of the chief problems facing the successive ministers of finance has been the maturing short-term treasury certificates, which on Jan. 1, 1925, totaled 5,096,650,000 crowns. With the refunding of 715,915,000 crowns of these certificates, this debt will have disappeared, partly through repayment and partly through substitution of three-year and five-year issues. The funding of the debt to the United States in the amount of \$115,000,000 was accomplished in October, 1925. Immediately following the funding, a loan of \$25,000,000 was floated through an American banking house, the proceeds of which were used principally to pay off short-term treasury certificates. In February, 1926, an internal bond issue of 1,900,000,000 crowns was floated. Half of the amount was composed of new bonds issued in exchange for securities of the old Austro-Hungarian State railways and represented the major portion of the amount assessed to the government of Czecho-Slovakia for the railways at the time of the formation of the republic; the balance consisted of subscriptions of cash or short-term treasury certificates, as a result of the requirement by the ministry of finance that bonds be purchased to the amount of those presented for conversion.

COMMUNICATIONS. On Jan. 1, 1924, there were 8497 miles of railway line, of which 5670 miles were owned by the state. Returns of the Czecho-slovak railways for 1925 showed a surplus of 191,000,000 crowns (about \$5,730,000) of receipts over expenditures. Receipts for the year totaled 4,169,000,000 crowns, and expenditures 3,978,000,000 crowns. This improvement is attributed to an increased capacity of the workers, a better system of economy, and increased passenger and freight traffic. Freight traffic for the period January–November 30, 1925, showed 5,024,070 cars loaded, in comparison with 4,859,321 cars in 1924. In 1925, in addition to the Bustehrad and Ustec-Teplice railways, 48 local lines were taken over by the government. Besides this expense the government has made large disbursements for repairing roadbeds and replacing ties, as it has hitherto been impossible to replace properly the property damaged during and since the war. Orders were given during the year for the electrification of the Wilson Station in Prague, and part of the main railroad line from the suburbs to the centre of the city through this station. Sixteen locomotives were ordered for express trains, with a maximum speed of 90 kilometers per hour. The first section of the road to be electrified will be about 50 kilometers in length.

GOVERNMENT. According to the constitution passed by the National Assembly, Feb. 29, 1920, executive power is vested in a president, elected for seven years by the two chambers in joint

session, who appoints and recalls his ministers; and legislative power in a senate of 150 members and a chamber of deputies of 296 members, the former elected by all citizens over the age of 26 and the latter by all citizens over the age of 21. The principle of proportional representation is applied. President, Thomas G. Masaryk (elected May 28, 1920). The ministry (appointed Mar. 18, 1926) was as follows: Prime Minister and Minister of the Interior, M. Cerny; Foreign Affairs, Dr. Beneš; Finance, Dr. Englis; Commerce, M. Peroutka; Public Works, M. Roubik; Railways, M. Riha; Health, M. Prochazka; Social Welfare, M. Schiessel; Justice and Food Supplies, M. Haussmann; Agriculture and Unification of Laws, M. Slavik; Education, Professor Kremer; National Defense, General Syrový; Posts and Telegraphs, M. Fatka; for Slovakia, Dr. Kallay. See ARBITRATION, INTERNATIONAL.

### HISTORY

FOREIGN AFFAIRS. Early in the year in an article published in the *New York Times*, Foreign Minister Beneš stated that his country was on very satisfactory terms with all European countries with the exception of Hungary. He said that Czecho-Slovakia would "do everything in its power to bring about a final and peaceful adjustment of its relations with this state and to regulate the question of economic cooperation by means of a commercial treaty." He also hoped for political cooperation in time. This statement evidently referred to a previous article which referred to a Central European Locarno and promised that the Czechs were ready to approve a revision of the Treaty of Trianon and give back certain territories which were inhabited solely by Hungarians. The same inspired article said that the Czechs were ready to accept any other settlement of the monarchical question than the accession of Archduke Otto as King of Hungary.

An event of far reaching importance in Central European affairs was the signing of the Austro-Czecho-Slovak Treaty of Arbitration on March 5, at Vienna, amid profuse expressions of amity and friendship. The provisions of the treaty made arbitration practically obligatory in every case. A permanent arbitration board was created with right of appeal from this body to the court at The Hague. Disputes of a political nature, if not settled in the regular diplomatic channels, had to be submitted to The Hague, from which a joint appeal could be taken to the Permanent Court of International Justice. The treaty was to be in force for ten years and was renewable for another ten years.

CABINET CHANGES. On March 17, the Svehla cabinet resigned because of its failure to solve satisfactorily the questions of pay for state employees and the additional tax on grain. Svehla had resigned in November, 1925, because of the results of the parliamentary elections but had been requested to keep the cabinet post when others were unable to form a new one. The cabinet as formed to succeed that of Svehla is given above.

THE FASCIST MOVEMENT. During May a demonstration was held in Slovakia in support of the Fascist movement which has grown to considerable proportions not only in Slovakia but in the Czech land as well. A liberal organization was formed among the Czechs to fight the

new organization and the government threatened to take repressive measures if necessary. The Slovak Fascists demand autonomy for Slovakia and the recognition of the Catholic faith. They promised to cooperate with the Czech Fascists if the latter stayed out of Slovakia. The Czech movement was largely anti-German and anti-Jewish and aimed to rid the country of the factory owners of these nationalities. They also advocated a new constitution with a much stronger executive head, probably similar to that of Mussolini in Italy.

**THE SESSION OF PARLIAMENT.** After a stormy session Parliament adjourned on June 26, with a record of much important legislation behind it. A new protective tariff was levied which increased the duties on agricultural products; the wages of state employees were raised; and a "clergy emoluments" bill was passed. The session was probably the stormiest that the country had witnessed since it became independent, and new party alignments were brought about. The Socialist coalition was broken up and the control of the parliament passed into the hands of the Agrarian and Populist parties supported by the German Agrarians and the Christian Socialist groups. Racial lines were thus broken up and the economic interests of the members came to the fore and dominated the political field.

**DAHOMY, dà-hó'mí.** A French colony on the west coast of Africa between Togoland on the west, the British possessions of Lagos and Nigeria on the east, and the French military territories on the north. It is a subdivision of the colony of French West Africa (q.v.). The colony has only about 70 miles of coast, but opens out northwards into a wide hinterland. Area, 42,460 square miles; population, according to the census of 1921, 842,243, of whom 538 were Europeans. The chief centre of trade and the seat of the government is Porto Novo with a population of about 20,000. The population is of pure negro blood, and belongs to the Ewe family. They are very industrious and engage mainly in agriculture. In the coastal region they raise potatoes, corn, manioc, and yams. In the central provinces, cotton culture has been introduced. The forests contain oil palms of commercial importance. The chief exports are palm oil and palm kernels. The local budget for 1924 was 11,160,000 francs.

**DAIRYING.** The dairy industry in the United States was generally prosperous throughout the year. The prices received for dairy products were somewhat lower than in 1925 during most of the year, but lower feed prices tended to offset the lower prices received for dairy products, leaving an encouraging spread between feed costs and milk receipts. The Western butter producers were not in quite as favorable a position as Eastern fluid milk producers as butter prices were relatively lower. Higher prices for cows and increases in the number of heifer calves raised indicated the dairymen's feelings.

The trend toward a decreased production of milk tended to offset the effect of large stored surpluses which were so serious at the end of 1924 and beginning of 1925. The 1926 season also opened with a relatively large carry over. The threat of foreign shipments of butter which was so prominent at the end of 1925 was almost entirely absent until the fall of 1926. In April the tariff on butter was raised from 8 to

12 cents per pound, and after that time butter imports were of no significance in the American market until late in the year when a price difference of approximately 18 cents per pound on December 1 between New York and Copenhagen prices favored the importation of considerable amounts.

The long-time trend in dairy production was toward an increased net importation except for the interruption during the War period, and since 1920 this trend had been resumed. During the year 1926 the exports of all dairy products except butter showed more or less decrease as compared with 1925, and those of 1925 were lighter than for 1924. The exports of milk and cream were relatively insignificant, but there were 32,317,862 pounds of sweetened condensed milk and 63,224,162 pounds of evaporated milk exported during the first 10 months of 1926 as compared with 35,187,596 and 94,830,074 pounds, the amounts exported in the corresponding period of 1925. Cheese exports, which were relatively small, decreased from 8 million pounds in the 10-months period of 1925 to 3 million in 1926, and malted milk showed a decrease of somewhat less than 20 per cent. On the other hand, butter exports increased slightly from 4,560,047 pounds in 1925 to 4,677,221 pounds in 1926. A large portion of the unsweetened evaporated milk exported by the United States, 20 million pounds, went to the United Kingdom, but most of the other dairy products were sent to other than European countries.

The largest imports of dairy products were those of cheese, which consisted mainly of special foreign types. The cheese imported increased from 42,243,279 in the first 10 months of 1925 to 57,284,571 pounds in 1926. The largest increase from any single country was that of over 2 million pounds from Italy. For a number of years cheese imports from Italy had shown considerable increases.

The amount of butter imported decreased from approximately 6 million to less than 5 million pounds, probably due somewhat to the increase in the duty from 8 to 12 cents in May, 1926, and also to the fact that the foreign prices were sufficiently maintained so that butter could not be profitably imported. The imports of milk powder decreased from 4,669,568 pounds to 3,685,042 pounds. The condensed and evaporated milk also decreased from approximately 4,600,000 pounds to less than 2 million pounds. These trends indicated a general tendency for the dairy industry of the United States to be on a self-sustaining basis without any particular efforts for the production of dairy products for export or the importation of any considerable amounts except in case of special types of cheese.

**INTERNATIONAL CONDITIONS.** The low price of butter in the importing countries of the world during the late fall and early winter of 1926 was undoubtedly the most significant event in the foreign dairy situation. The prices in European markets fell below those in the United States by fully 50 per cent more than the tariff of 12 cents per pound. With the season of heavy production approaching in New Zealand and Australia the outlook was most unfavorable in those countries.

The two greatest butter-importing countries of the world are Great Britain and Germany. The statistics show that the imports of butter and cheese into these countries were no greater

than in the previous year. The greater part of the price decline was traceable to developments unfavorably affecting British industry and purchasing power. The British butter markets had just begun to recover from the effects of the accumulated supplies resulting from the seamen's strike last year when the strike of the coal miners began to affect the buying power of the industrial classes.

The German imports of butter during the first eight months of 1926 were 158,540,000 pounds, as compared with 164,332,000 pounds for the corresponding period of 1925. Increased domestic supplies were considered largely responsible for the lessened importation before July, but during this month heavy imports were made in anticipation of the increase in the tariff from 2.43 to 3.24 cents per pound on August 1. The August receipts, however, did not appear to be greatly affected by the increased tariff, though some reduction was evident. The large exports of Danish butter which usually go mainly to Great Britain were in part diverted to Germany during the year, and the greater part of the Danish exports of cheese were also absorbed in Germany.

The production of butter in Russia, which has been steadily increasing since the War, did not reach the amounts anticipated, probably because of the low price in the importing countries. Nevertheless, Great Britain and Germany together received 43,695,000 pounds of Russian butter during the first nine months of 1926 as compared with 41,792,000 pounds during the same period of 1925.

Exports of butter from the countries of the southern hemisphere, which is of course heaviest in our fall and winter months, were starting somewhat stronger during October and November than in the preceding year. In New Zealand dairying appeared to be offering stiff competition to the frozen meat business and was forcing it out in many sections.

There had been a very great decline in the exports of condensed and evaporated milk from the United States for several years. Various factors had an influence in this respect. The United States was showing a general tendency to export smaller quantities of dairy products. A German tariff of six cents per pound tended to reduce exports to that market, and the British market, which formerly absorbed the largest amounts of the United States concentrated milks of any of the countries, had undergone a distinct change from whole condensed to condensed skim milk, which had been received in enormous quantities from the Netherlands. The establishment of butterfat standards for whole condensed milk not in conformity with the American product was mainly responsible for the stimulus to the condensed skim milk trade.

**RESEARCH.** Several of the State agricultural experiment stations conducted investigations during the year relating to the physiology of milk secretion. The Georgia station found that cooling the cows by dampening muslin blankets was favorable to milk production during the heat of the summer. At Missouri the fat percentage of the milk produced was related to the environmental temperature. Between 70 and 30° F. the fat percentage increased approximately 0.2 per cent for each 10° reduction in temperature. At Illinois the total solids content of milk

was related to the environmental temperature as increases in the temperature lowered the solids content of the milk without appreciably affecting the total production. At Tennessee the milk production of cows freshening in July, October, November, December, January, and February was higher than that of cows freshening during the other months of the year. A study of the relation between the secretion of the various constituents of the milk at Illinois Station showed that fat and protein were intimately related, but water and fat and water and protein appeared to be largely independent. The Iowa station found that during the oestrous period the milk production of the cows in the station herd was lowered. Milk production during the lactation period was found at Illinois to drop off at a regular rate, but the rate of decrease was larger as the stage of pregnancy advanced. The same station found that considerable amounts of oil in the feed materially increased the fat percentage of the milk.

A number of agricultural experiment stations, Alabama, Michigan, Iowa, Ohio, New York Cornell and Wisconsin, and the U. S. Department of Agriculture showed that milk production was influenced by the supply of calcium and phosphorus in the ration and the ability of the animal to assimilate these substances.

From experimental work conducted for a number of years at the New York Geneva station an atlas was prepared which contained 16 microphotographs of methylene blue preparations of market milk and cream which were treated in various ways. By the use of this atlas it is possible to determine the previous treatment of samples of milk and cream; for instance, pasteurized and raw milk may be differentiated as well as milk which was handled in poorly cleaned utensils or which was improperly cooled.

Several agricultural colleges made studies of the effect of various ingredients in ice cream on the freezing and the quality of the finished product. It was generally found that cane sugar, milk sugar, aging, and neutralizing lower the freezing point, while the use of gelatins or other ice cream improvers added materially to the standing-up qualities. They also gave body and texture and improved the flavor of ice cream having a low percentage of solids.

W. E. Skinner, secretary and general manager of the National Dairy Exposition for 15 years, resigned this position.

**NECROLOGY.** Prof. William Alonzo Stocking, jr., (q.v.) head of the dairy department at Cornell University from 1909 to 1923, died on Feb. 3, 1926. Professor Stocking was well known as one of the early workers in dairy bacteriology.

**BIBLIOGRAPHY.** The more important books on dairying recently published include: W. W. Yapp and W. B. Nevens, *Dairy Cattle; Selection, Feeding, and Management* (New York and London, 1926); A. H. R. Ames and H. C. Johnson, *Manual of Dairy Science* (Auckland and London, 1926); P. Dornic and A. Chollet, *Lait, Beurre, et Dérivés* (Paris, 1926); G. S. Thomson, *Grading Dairy Produce* (London, 1925); C. Knoch, *Handbuch der Neuzeitlichen Milchverwertung* (Berlin, 1926); J. A. Newlander, *Testing Dairy Products* (Milwaukee, 1926); W. Grimmer, *Milchwirtschaftliches Praktikum* (Leipzig, 1926); A. D. Burke, *Practical Dairy*

*Tests* (Milwaukee, 1926); C. Thom and W. W. Fisk, *The Book of Cheese* (New York, 1925, rev. ed.); W. W. Fisk, *Fancy Cheese* (Milwaukee, 1925); O. F. Hunziker, *Condensed Milk and Milk Powder* (La Grange, 1926, 4th edition, rewritten and enlarged).

See also **FOOD AND NUTRITION**.

**DALFERNITE**. See **CHEMISTRY**, under **MINERALOGICAL CHEMISTRY**.

**DALMATIA**. A province in Jugo-Slavia; a crownland of Austria until the downfall of the Dual Monarchy in 1918. It extends from Bosnia and Herzegovina west to the Adriatic Sea. Area, 4916 square miles; population, according to the census of Jan. 31, 1921, 621,429. Capital, Zara, with a population in 1921, of 18,060.

**DAMS**. During the year a number of notable structures were in process of construction in order to supply power for hydroelectric plants and for processes of irrigation. As usual, some of the work of the United States Bureau of

by the Alabama Power Company, amounting to a capacity of 70,800,000,000 cubic feet, aroused interest in the consideration of the relative size of other artificial reservoirs. A tabulation was prepared which gave the largest artificial reservoir in the world as that of the St. Maurice River in the Province of Quebec. This with the other large reservoirs in order of magnitude has a capacity as follows:

Reservoir	Capacity, cu. ft.
Gouin, St. Maurice River, Quebec . . .	160,000,000,000
Elephant Butte, New Mexico . . . . .	114,911,000,000
Assuan, Nile River, Egypt . . . . .	91,800,000,000
Roosevelt, Salt River, Arizona . . . . .	71,321,000,000
Martin Dam, Tallapoosa River, Alabama	70,800,000,000

When the American Falls reservoir in Idaho is enlarged to its ultimate capacity by the construction of the dam to its full height it will have a capacity of 74,052,000,000 cubic feet.

\* Construction not commenced Dec. 31, 1926.

\* Under construction Dec. 31, 1926.

Reclamation was particularly notable, while the various power companies had under way important structures and new designs were being prepared to meet the demands for water power which can be transformed through generating plants into electric power transmitted over considerable distances.

The enormous artificial lake created by the Martin Dam across the Tallapoosa River, built

**STEVENSON CREEK EXPERIMENTAL ARCH DAM**. During the year, announcement was made of the results of tests on the Stevenson Creek Experimental arch dam in California, which has been discussed in earlier issues of the **YEAR BOOK**. (See **YEAR BOOK** for 1923, 1924 and 1925.) This dam was completed early in June, the last concrete being placed June 4 and the last wooden frame being removed June 10. The dam was con-

sidered a satisfactory test specimen, accurate in shape and dimensions and free from objectionable defects. During the year a complete set of deformation, strain, and slide measurements were made on varied loads up to those produced by a head of 60 feet of water, the height of the crest of the dam. The only signs of failure in the structure were two vertical cracks in the centre line of the dam, one extending from the lowest point upward some 13 feet and the other from the highest point downward some 19 feet. The top crack, however, did not permit water to seep through. Its maximum width was about .003 inch, and the lower crack was still smaller. The measurements made enabled the engineers to determine the load carried, due to the horizontal thrust in the horizontal elements, for all parts of the dam, under the 60-foot head. The engineers also estimated the load carried by the bending of the horizontal elements at certain places, and particularly determined the load carried by the bending of the vertical elements. After the series of measurements were made the reservoir was emptied, but both surfaces of the dam were kept wet by sprinkler pipes. While a detailed consideration of the field records was being made, the engineering committee was engaged in studying the advisability and nature of further tests on the dam.

**AMERICAN FALLS DAM.** During the year the American Falls dam on Snake River in Idaho, designed to store water for supplementary irrigation of Twin Falls, Minidoka, and other tracts, and for irrigation of new areas north of Minidoka, was practically completed and the storage of water began in October. This dam, the total cost of which was about \$1,600,000, was 4756 feet in length and 60 feet high, being composed of concrete overfall and plane gravity sections and earth embankments. A storage capacity of 1,700,000 acre-feet was provided.

**COOLIDGE DAM.** On December 2 the contract was awarded for the Coolidge Dam to be built across the Gila River near the San Carlos Indian Reservation to irrigate land near Florence and Casa Grande in Arizona. This dam would provide a storage of about 1,300,000 acre-feet of water and was to be of a new type called "multiple-dome," and was 249 feet in height and about 600 feet in length, composed of three-arch spans, curved both horizontally and vertically, the spans being 180 feet centre to centre.

**STONY GORGE DAM.** Toward the end of 1926 authority was granted for the awarding of the contract for the construction of the Stony Gorge Dam on the Orland Project, California, by the Bureau of Reclamation, United States Department of the Interior. This dam was to cost \$518,904 and to be of reinforced concrete, of the buttress type, with a reinforced concrete face slab. The main outlet works consisted of two metal pipes through the dam, each controlled by a hydraulically operated sluice gate near its up-stream end and a balanced needle valve at its down-stream end. A secondary outlet consisted of a small needle valve and gate valve. In the central part of the dam the spillway was located, controlled by three 30 X 30-foot gates.

**OHIO RIVER DAMS.** In the scheme of improving the Ohio River for navigation and providing a minimum channel depth of nine feet for the entire length of 908 miles, the United States

Corps of Engineers had under way during the year a number of dams to raise the water level and to provide by locks navigable passes. Up to the end of 1926, 692 miles of the river had been made available for navigation and about \$76,000,000 had been spent, out of a total estimated cost of \$105,000,000. The portion of the project under way in 1926 involved construction of one fixed and 51 movable dams, with navigation locks 110 by 600 feet at each dam. The navigable passes varied in width from 600 to 1248 feet and were closed by wickets of the Chanoine type. Between Emsworth, Pa., and Louisville, Ky., at the end of 1926, 38 dams had been completed and were in operation except for minor details in a few cases. At Louisville a dam was under construction in connection with the development of electric power, while below that point three dams were completed and in operation and eight were under construction.

**MARTIN DAM.** During the year there was completed the Martin Dam and power house at Cherokee Bluffs, a storage power project on the Tallapoosa River, about 42 miles north of Montgomery, Ala. This dam formed a reservoir 39,400 acres in area, and, with the power house of the head-wall type, located at the dam, was one of the notable operations in the hydroelectric field.

**CONOWINGO DAM.** Work was begun in May, 1926, on a 4800-foot dam and power house near the mouth of the Susquehanna River, designed to provide for seven 54,000 h.p. generating units, or a total of 378,000 h.p. in the power house. This was being constructed by the Susquehanna Power Company, a subsidiary of the Philadelphia Electric Company, and, in addition to the capacity mentioned, provision was made for four more similar units. At the end of 1926 the excavation and concrete work for the west abutment were practically finished and, in the power house section, the excavation had progressed to approximately 80 per cent completion, and 13 per cent of the concrete had been poured. About 15 per cent of the tail race had been excavated, while at the east end of the dam 65 per cent of the excavation had been accomplished and 75 per cent of the concrete scheduled for the first construction step had been poured. See WATER-WORKS AND PURIFICATION.

**EGUZON DAM.** A notable hydro-electric station, designed for supplying motive power for the electrified portions of the Paris-Orléans Railway, was built near Eguzon on the River Creuse, in France. It involved a dam and power house capable of providing 8000 kw. of electrical energy continually during nine months of the year, 18,000 kw. during six months, and 28,000 kw. during three months. The dam was curved in plan, with a thickness of wall varying from five meters (16.4 feet) at the crest to 54 meters (177.17 feet) at the lowest point of the foundation. The upstream face had a batter of 1 in 1.205, save at the top where the face was curved up almost to the vertical. The greatest height of the dam was 61.1 meters (200.44 feet) and it formed a reservoir containing 54,000,000 cubic meters (71,000,000 cubic yards), or approximately 11,880,000,000 gallons, of water. At each end of the dam there is an outlet tower comprising two openings three meters wide and seven meters high and governed by stop valves, and on the downstream side of the gates the

two openings unite to form a pressure pipe 4.24 meters in internal diameter. There are two spillways, one at the right bank and one on the left, with automatic weirs and appropriate sluice openings. The power house proper, at the foot of the dam, had an equipment in 1926 of five main turbines, each of 15,000 h.p. and each coupled direct to a 12,500 k.v.a., three-phase, 10,500-foot, 50-cycle alternator.

**DANISH LITERATURE.** See SCANDINAVIAN LITERATURE.

**DANZIG.** A free city, which, with its surrounding territory, was established by the Treaty of Versailles in 1919. It was formerly a part of the German Empire. Area, about 754 square miles; population, Aug. 24, 1924, 386,000. The administrative district of the city of Danzig had a population of 207,100. The city is the chief outlet for the commerce of Poland and continues to maintain its century-old position of being the leading grain port of the Baltic. Shipping is the chief industry, manufacturing being engaged in largely for local consumption. Only relatively insignificant amounts of the outgoing traffic in 1925 represented goods of strictly Danzig origin, such as sugar and manufactures of amber and bakelite; nevertheless the very considerable decline in this purely local export trade was a large contributor to Danzig's economic ills in 1925. The chief exports in 1925 were lumber, coal, grain, and sugar. Although the tonnage of goods shipped from Danzig always far exceeds that of goods received, this disparity was even more marked in 1925. Whereas the shipments in 1924 totaled 1,636,485 metric tons and the receipts 738,072 tons, in 1925 the shipments advanced to 2,031,969 and the receipts dropped to 690,779 tons. For the first time in the post war period, however, the aggregate tonnage of cargo, incoming and outgoing, through the port of Danzig exceeded the pre-war traffic, as seen in the accompanying table:

GROWTH OF POST WAR TRAFFIC THROUGH  
THE PORT OF DANZIG  
[In metric tons]

Year	Cargo shipped	Cargo received	Total
1912. . . . .	1,311,757	1,141,455	2,453,212
1919. . . . .	72,235	174,000	246,235
1920. . . . .	138,216	1,700,000	1,838,216
1921. . . . .	378,952	1,026,420	1,405,372
1922. . . . .	504,411	466,287	970,698
1923. . . . .	1,062,864	654,929	1,717,793
1924. . . . .	1,636,485	738,072	2,374,557
1925. . . . .	2,031,969	690,779	2,722,748

In 1924 3312 vessels of 1,634,970 tons entered and 3330 vessels of 1,648,050 tons cleared the port. The budget for the fiscal year Apr. 1, 1926, to Mar. 31, 1927, as passed by the Danzig Volkstag on May 5, 1926, balanced at 117,857,-180 gulden, and shows an increase of 4,147,450 gulden over the 1925-26 budget of 113,709,-730 gulden, which was exceeded by actual disbursements. (1 gulden equals \$0.193.) The government of the free city is in the hands of a High Commissioner appointed by the League of Nations. Its constitution, approved by the League May 11, 1922, provides for a legislative assembly of 120 members elected for four years, a senate consisting of 20 members, and a president and vice-president. The senate is the highest authority in the state and holds secret ses-

sions. High Commissioner at the beginning of 1926, Dr. van Hamel (appointed Feb. 22, 1926).

**DARE, VIRGINIA.** ANNIVERSARY OF BIRTH OF. See CELEBRATIONS.

**DARTMOUTH COLLEGE.** A non-sectarian institution of higher education at Hanover, N. H.; founded in 1769. The 1926 fall session had an enrollment of 2247 students, most of whom were working for the regular college degree, the exceptions being 11 graduate students; 36 in the Medical School; 14 in the Thayer School; 81 in the Tuck School; and 1 unclassified student. There were 200 members on the faculty. The productive funds amounted to \$8,500,000. The library contained 221,000 volumes. At the 1926 fall meeting the Board of Trustees authorized the construction of a new biological laboratory and of two new dormitories, to be begun in 1927. During the year a library estimated to cost \$1,000,000 was begun, and an athletic field house was constructed. President, Ernest Martin Hopkins, A.M., Litt.D., LL.D.

**DAVID, SIR SASSOON.** Indian cotton merchant, died in Bombay, India, September 27. He was born in Bombay, Dec. 11, 1849, the son of Jacob Isaac David, a prominent member of the Jewish community of that city and one of the first Jews to come to Bombay. He was educated at Elphinstone College and Bombay University, where he received the degree of B.A., and joining the firm of E. D. Sassoon and Company, doing business in China, represented that firm for some years in China as partner and also in Bombay. In 1885 he founded his own firm and was agent of the David and Standard Mills, and the leading cotton yarn merchant of Bombay. He was chairman of the Millowners' Association, 1904-05, and sheriff of Bombay in 1905, in which year he was knighted. He was for several years a government nominee on the Bombay Municipal Corporation and the Standing Committee, and was president of the Bombay Municipal Corporation, 1921-22. Although making his headquarters in Bombay he had firms in China, was the director of several public companies, and on the committee of several charitable associations. In 1911 he was created a baronet, and in 1922 a Knight Commander of the Order of the Star of India. He was the founder and chairman of the Bank of India.

**DAVIS, CHARLES BELMONT.** American dramatic editor, died at Nashville, N. C., on December 9. He was born at Philadelphia, Pa., on January 24, 1866, and was educated at Lehigh, graduating in 1887. He then became a reporter on the *New York World*, and it was while serving in this capacity that he published his first short story, *A Friend of the Family*. He was for a time fiction editor of *Collier's Weekly*, and had charge of one of the short-story contests directed by that magazine. From 1893 to 1897, Mr. Davis was United States Consul at Florence, Italy, and in 1900 he became manager of the Weber and Fields Music Hall. He also served on one of the missions sent to England during the World War, and in 1923 he joined the staff of the *New York Herald Tribune* as dramatic editor. He was the author of many short stories appearing in various magazines; some of them were later collected and published in book form. Some of his works were the following: *The Stage Door*; *Tales of the Town*; *The Borderland of Society*; *The Lodger*

*Overhead; Nothing A Year; In Another Moment; and Her Own Sort.*

**DAVIS**, Rt. Rev. JAMES J., Bishop of the Catholic Diocese of Davenport, Iowa, died on December 2, at Davenport, Ia. He was born in Ireland on Nov. 17, 1852, and began his studies for the Catholic priesthood at Done-magin, Ireland, and, completing the classical course in Carmelite College, entered St. Patrick's Seminary in Carlow. Here he was ordained on June 21, 1873. He first went to the Diocese of Dubuque, I., and served in various parishes. On Nov. 30, 1904, he was consecrated Coadjutor Bishop of Davenport and Titular Bishop of Milopotamus. When the Rt. Rev. Henry Cosgrove died in December 1906, Bishop Davis succeeded to the See of Davenport.

**DAWES PLAN.** The third year of the experts' plan for the payment of reparations by Germany started on September 1. In commenting upon the completion of the second year of the plan Seymour Parker Gilbert, the Agent-General for Reparation Payments stated: "With the payment this morning of 45,000,000 gold marks by the German Railway Company, Germany has made payment of the full annuity of 1,220,000,000 gold marks provided for in the second year of the experts' plan, except for a small balance of about 8,095,000 gold marks on account of the transport tax, which does not become due until Sept. 21, 1926. To-day's payment by the German Railway Company represents the balance due on Sept. 1, 1926, on account of the second year's interest on its reparations bonds. Germany is thus faithfully performing her obligations and has made punctually the payments falling due the second year of the plan."

Mr. Gilbert's statement itemized the second year's annuity payments as follows: Budget, 250,000,000 marks; Railway bonds (interest), 595,000,000 marks; Transport Tax, 241,950,000 marks; and debentures, 125,000,000 marks. Owing to the unexpended balance remaining from the first annuity year and the interest earned on cash deposits, the total sum available for transfer to allied treasuries during the year was 1,269,412,000 marks. Of this sum 415,000,000 marks was transferred in foreign currencies, chiefly through French and British reparation recovery acts. For the first time, 65,000,000 marks was transferred in actual cash. By mark payments, chiefly consisting of deliveries in kind, to the value of 656,800,000 marks, plus 86,000,000 marks for the army of occupation, 760,000,000 marks were transferred. This constituted 65 per cent of the total amount transferred, which was 1,175,000,000 marks.

On September 2, the United States Treasury announced the receipt of \$5,900,000 from Mr. Gilbert, representing the annual payment due the United States for the liquidation of the American wartime claims against Germany. This was the first cash payment received by the United States under the operation of the Dawes Plan. Up to that date the treasury had been credited with approximately \$14,000,000 by Germany on account of the cost of the American army of occupation and the United States is to receive about \$12,000,000 a year until the \$250,000,000 obligation is settled. Under-Secretary Winston stated that the payments for army occupation costs were in addition to 2½ per cent of annual reparations set aside to pay American claims.

As a result of an agreement between Mr. Gilbert and Dr. Reinhold, German Finance Minister, at the beginning of September, the Dawes Plan was modified so that Germany, on account of the supplemental yield of her controlled revenues, would pay 300,000,000 marks in cash in the year 1926-27 instead of 500,000,000 during the two years beginning Sept. 19, 1927. This arrangement presented an obvious advantage, giving the Reich's financially embarrassed creditors, particularly France, a large additional amount of money immediately. It also served to emphasize the German government's resolve to carry out the plan so far as is compatible with German national solvency. Mr. Gilbert, after consultations with Dr. Reinhold, fixed the annuities for the three ensuing years at 1,500,000,000 marks, 1,750,000,000 marks, and 2,500,000,000 marks, the last figure being the normal annual payment foreseen for that year by the experts. Mr. Gilbert said that the new arrangement "will reduce the danger of an undue strain on German economy and facilitate the even flow of deliveries and payments and will increase by a substantial amount the funds available for deliveries in kind during the third annuity year."

**DEATH.** See ZOOLOGY.

**DEATH RATE.** See VITAL STATISTICS.

**DEBS**, EUGENE VICTOR. American Socialist leader, died on October 20, at Elmhurst, Ill. He was born on Nov. 5, 1855, at Terre Haute, Indiana. At the age of 14 Debs worked in the railroad shops of Terre Haute, and two years later he became a fireman on the Terre Haute and Indianapolis Railroad. After three years of this life he went to work as a grocery salesman. His education was mostly from his own reading, but even while engaged in firing an engine at night he would sleep but half the day so as to attend school in the afternoons. From his poor earnings he bought an encyclopedia on instalments and began to study grammar and literature. The revolutionary history of the United States, as well as that of France, fired his imagination and he set himself to emulate their leading figures. Feeling keenly his lack of instruction, he sought by every means in his power to remedy the defect. He was particularly interested in the orations of "men who spoke before their time," and in his mind, Patrick Henry and Thomas Paine were set up as idols. His interest in labor problems caused him to leave the grocery store in 1875 and enter the local lodge of the Brotherhood of Locomotive Firemen as a charter member. He had previously taken part in the organization of the Brotherhood of Railway Brakemen, later the Brotherhood of Railroad Trainmen. His political career actually began with his election as City Clerk of Terre Haute for four years from 1879. In 1885 he was elected to the Indiana Legislature. In 1880 Debs was elected Grand Secretary and Treasurer of the Brotherhood of Locomotive Firemen, and editor of the *Firemen's Magazine*. This work occupied him until, in 1893, he organized and became first president of the American Railway Union. In the following year the strike against the Great Northern Railway was considered a great victory for industrial unionism. Two months later occurred the Pullman dispute, and to add strength to the strikers,

Debs called out other workers and tied up 20 railroads. This strike was marked by intervention on the part of President Cleveland, who sent Federal troops to Illinois to protect the mails and interstate commerce and keep order and check bloodshed in spite of the protests of Governor Altgeld. Debs was arrested on a charge of conspiracy but was released, being subsequently arrested and later given a six months prison sentence for failure to obey an injunction.

It was while serving this sentence in Woodstock, Ill., prison, that Debs became a Socialist. He read *Das Kapital*, by Marx, but while the new belief was forming he supported William Jennings Bryan in 1896. It was in the following year that he announced himself boldly as a Socialist, and in that year he took a prominent part in formation of the Social-Democratic Party. Soon after this Debs became a prolific writer and a startling lecturer. In 1900 he was nominated for President, and also in 1904, when he polled four times as many votes as he had received in 1901. In 1908 he was again a candidate, and his votes represented double those cast for him on the previous occasion. In 1912 he ran again, but was once more unsuccessful. In 1920 he was once more a presidential candidate and received about a million votes although at the time he was in an Atlanta cell serving a 10-year sentence for his criticism of the Government's part in the war, in a speech made at Canton, Ohio, in 1918. In December, 1921, his sentence was commuted by President Harding. After his release from prison, Debs was not very active, although he went to New York in 1925 to campaign for the Socialist candidate for mayor. His work on behalf of the political prisoners, whose champion he had become, together with his advancing years, broke down his health, and in April, 1926, he went to Bermuda. On his return he spent almost all of his time at his home at Terre Haute, until in September he had to enter a sanitarium, at Elmhurst, Ill., where he died.

#### DECLARATION OF INDEPENDENCE.

See CELEBRATIONS.

**DECOURCELLE, PIERRE.** French author and dramatist, died in Paris, October 9. He was born at Paris, January 25, 1856, the son of Adrien Decourcelle, the dramatist, and was educated at the Lycée Henri IV. He married a daughter of Edmond About and at an early age devoted himself to drama, his first play, a comedy, being *Grain le Beauté*. In 1883 he brought out *Fond de Sac*, and in 1887, *L'Abbé Constantin*. Among his tragedies, many of which were based on novels were *L'As de trèfle* (1883); *La Charbonnière* (1884); and *Gigolette* (1893). *Fanfan, ou les deux Gosses*, produced in 1889, was translated into many languages and held a French record of 751 consecutive performances. Decourcelle collaborated with various authors and was one of the most prolific novelists and dramatists in France. He was also a collector of books, manuscripts, and objects of art, and was treasurer of the Commission de la Société des Auteurs et Compositeurs Dramatiques.

**DELAWARE.** POPULATION. According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 223,003. The estimated population on July 1, 1926, was 240,000. The capital is Dover.

**AGRICULTURE.** The following table gives the

acreage, production and value of the principal crops in 1925 and 1926:

Crop	Year	Acreage	Prod. bu.	Value
Corn	1926	138,000	4,278,000	\$2,738,000
	1925	137,000	5,069,000	3,295,000
Wheat	1926	103,000	2,060,000	2,678,000
	1925	102,000	1,887,000	2,736,000
Hay	1926	80,000	118,000 *	2,158,000
	1925	79,000	112,000 "	2,192,000
Potatoes	1926	6,000	516,000	722,000
	1925	6,000	384,000	768,000
Sweet potatoes	1926	9,000	1,251,000	813,000
	1925	8,000	880,000	1,672,000

\* tons.

**MINERAL PRODUCTION.** While relatively of small magnitude the State's production of minerals rose considerably in 1924, to a total value of \$512,105, as against \$416,074 for 1923. Stone was produced in the amount in 1924 of 93,130 short tons; in 1923, of 84,440 short tons; and to the value in 1924 of \$243,279, and in 1923 of \$132,157. Clay products, next in value, attained in 1924 a total of \$235,555, as against \$249,804 in 1923. Sand and gravel were also produced.

**FINANCE.** As summarized by the United States Department of Commerce, payments for the maintenance and operation of the general departments of the State for the fiscal year ending June 30, 1925, were \$4,039,022. Their rate per capita was \$17.29, as against \$16.18 in 1924. Their total included \$1,235,597 for education, apportioned to minor State divisions. Expenses totaling \$368,633 for interest on debt and \$2,932,399 for permanent improvements, added to payments for maintenance and operation of State departments made the total of State payments \$7,339,994. For highways was expended the sum of \$2,924,754, of which \$205,079 was for maintenance and \$2,719,675 for construction.

Revenue receipts of the State were \$7,315,426, or \$31.31 per capita. They exceeded by \$2,907,771 the total payments except those for permanent improvements, and were \$24,568 less than the total with these included. Property and special taxes formed 46.9 per cent of the revenue in 1925, as against 47.2 per cent in 1924 and 28.1 per cent in 1917. Their per capita rate was \$14.69 in 1925, \$16.29 in 1924 and \$2.11 in 1917. Earnings of the general departments and compensation for officials' services furnished 4.3 per cent of the 1925 revenue. Business and non-business licenses furnished 19.6 per cent.

The net indebtedness of the State on June 30, 1925, was \$7,311,869, or \$31.29 per capita, as against \$28.41 per capita in 1924 and \$4.02 in 1917. A bond issue of about \$1,000,000 was made in 1925 for highway purposes. The assessed valuation of property subject to tax was \$242,318,711. The State tax levy was \$605,797, or \$2.59 per capita.

**TRANSPORTATION.** The total mileage of railroad line under operation at the end of 1925 was 332.29. No new construction of line was reported in 1926.

**EDUCATION.** There ceased during the year to be any occupants of teaching positions in the State other than holders of the regular teacher's certificate, according to the State superintendent of public instruction, as quoted in the *Journal of the National Education Association*. Previously for many years a portion of the teaching personnel had held provisional certificates. A draft of a new school tax law was prepared by the State tax commissioner, who in an explana-

tory letter asserted that no attempt had been made in the draft to provide for an increase or decrease of the school income, and that the purpose was to bring the law abreast of development subsequent to enactment of the existing statute. The State Education Association reported 100 per cent enrollment of white teachers outside the city of Wilmington in its organization.

There were enrolled in the public schools of the State in the school year 1925-1926, 39,297 pupils, of whom 19,046 were boys and 19,651 were girls. The average daily school attendance was 32,858. Of the enrollment, 33,590 was in elementary schools, and of this 27,796 was enrollment of white children, and 5794 of colored. High school enrollment was 5707, divided as follows: White, 5374; colored, 333. The 1433 teachers in the state were thus classified: White, 1226; colored, 207. The average salaries ranged from \$1916 for white high school teachers in the city of Wilmington to \$885 for colored elementary school teachers in the rural special school districts. The year's school expenditure amounted to \$2,832,323. This total did not include \$774,726 of capital outlay for new buildings, met by bond issue.

**CHARITIES AND CORRECTIONS.** Activities are under a State Health and Welfare Commission established in 1923 and a State Board of Charities. Among the State institutions are a Home for the Feeble Minded and a system of industrial schools for whites and for the colored.

**POLITICAL AND OTHER EVENTS.** At the general election on November 2, Robert G. Houston, Republican, was reelected to the U. S. House of Representatives for the 70th Congress. Howard M. Ward was elected State treasurer. Edward Baker auditor and James G. Shaw insurance commissioner; all were Republicans. The proposal to amend the State constitution so as to abolish the grand jury as an agency in the finding of indictments, this duty being placed in the hands of the State's prosecuting officers in the grand jury's stead, was submitted to popular vote. It was rejected. The punishment of the whipping post was applied to several persons convicted of larceny in February, and advocates of this form of punishment, still retained on the penal statutes of the State, asserted that there had resulted from its application a reduction in the local cost of burglary insurance. An unruly mob at Georgetown, excited against a negro there on trial, threatened to break into the court house February 8, and was checked by militia.

**OFFICERS.** Governor, R. P. Robinson; Lieutenant-Governor, J. H. Anderson; Secretary of State, A. R. Benson; Treasurer, Thomas S. Fouracre; Auditor, J. M. Harrington; Attorney-General, C. A. Southerland; Commissioner of Insurance, Dr. Horace M. Hollis; State Bank Commissioner, Harold W. Horsey.

**JUDICIARY:** Chancellor, Josiah O. Wolcott; Chief Justice, James Pennewill; Associate Judges, Richard S. Rodney (at large), Herbert L. Rice, William Watson Harrington, and Charles S. Richards.

**DEL MAR, ALEXANDER.** American mining engineer and author, died at Little Falls, N. Y., July 1. He was born in New York, Aug. 9, 1830, and after studying at private schools, the Madrid School of Mines, and New York University, edited the *Daily American Times* in 1854; *Hunt's Merchants' Magazine* in 1860; the *Social Science Review* which he founded in 1864; and

the *Financial Chronicle* in 1865. In the latter year he organized and was director of the United States Bureau of Commerce, Navigation, Emigration, and Statistics which later became the United States Department of Commerce and Labor. He was a delegate to the International Congress at Turin, Italy, in 1866, to The Hague in 1868, and to St. Petersburg in 1872. He was mining commissioner to the United States Monetary Commission in 1876, and was later president of the Latin-American Chamber of Commerce.

Del Mar was a prolific author, covering a wide field of economic, ancient and modern history, and was an authority on money, publishing many volumes in which the history of money in various countries was discussed. His publications include: *Gold Money and Paper Money* (1862); *The National Banking System* (1865); *The History of Precious Metals* (1880); *The History of Money in Ancient Countries* (1884); *The Science of Money* (1885); *Money and Civilization* (1886); *The History of Money in America* (1899); *Ancient Britain* (1900); *Worship of Augustus Cæsar* (1900); *Middle Ages Revisited* (1900); *History of Money in the Netherlands* (1903); *Messiah, a History of the Colonization of Asia Minor, Egypt, and Europe from the Orient* (1907); *Chronology of America from Pytheas of Marseilles to the Death of Charles V* (1922); and numerous other works. He was a member of many learned societies including: Société de Statistique de Paris, Société Astronomique de France, Ligue de L'Enseignement de Bruxelles, Columbiina Society of Palos, Spain, London Chamber of Commerce, Philadelphia Philosophical Society, International Statistical Congress, etc.

**DE MOLAY, ORDER OF.** A non-sectarian secret organization for boys between the ages of 16 and 21, founded in 1919 by Frank S. Land, at Kansas City, Mo., and named in honor of Jacques De Molay, the last military Grand Master of the Knights Templar. There are chapters in the United States, Canada, Mexico, the Panama Canal Zone, Porto Rico, the Philippine Islands, Italy, and France. The members are pledged to promote the public school system, reverence women, honor their parents, and to observe certain obligatory days. The order is governed by a Grand Council of Freemasons and annual meetings are held. During 1926, state and interstate athletic competition was greatly increased. Cash prizes are given by the Grand Council to the chapters whose members show the best records in the advancement of civic affairs. There are regional camps at Manistee, Mich., Spirit Lake, Ia., and Hollister, Mo., and a national camp at Bear Lake, Col. In November, 1926, there were 1578 chapters, a membership of 212,000, and about 100,000 De Molays outgrown active membership. Frank S. Land was Grand Scribe of the Order, with headquarters at 1201 Federal Reserve Bank Building, Kansas City, Mo.

**DEMONSTRATION WORK.** See AGRICULTURAL EXTENSION WORK.

**DENISON UNIVERSITY.** A co-educational Baptist institution of higher education at Granville, Ohio; founded in 1830. The enrollment for the autumn of 1926 was 913, of whom 465 were men and 448 women. The faculty numbered 60. The income for the year was \$3,200,000; and the library contained 60,000 volumes. Acting President, Bunyan Spencer, D.D.

**DENMARK.** The smallest of the three Scandinavian states; comprising the peninsula of Jutland with its adjacent islands in the Baltic; the Faroe Islands; a part of Schleswig as a result of the plebiscite of 1920 under the terms of the Treaty of Versailles; and Greenland (q.v.), the only colony or possession. Iceland is a free sovereign state, but united to Denmark in the person of the King of Denmark who is also head of the government of Iceland (q.v.). Capital, Copenhagen.

**AREA AND POPULATION.** The area is 16,604 square miles, excluding the Faroe Islands, which have a population of 540 square miles; population, according to the census of Nov. 5, 1925, 3,419,656. North Schleswig, which voted in the plebiscite of 1920 to form a part of Denmark, has an area of 1538 square miles and a population in 1925 of 175,531. The islands in the Baltic had an area of 5133 square miles and a population of 1,266,137 in 1925. Of the population more than 95 per cent were born in Denmark. The movement of population in 1924 was: Births, 73,834; deaths, 38,107; marriages, 26,471; emigrants (chiefly to the United States and Canada), 6319. The population of Copenhagen in 1925 was 586,000, with suburbs, 729,214. Other large cities with their 1925 populations are Aarhus, 75,271; Odense, 52,208; Aalborg, 42,461; Horsens, 28,064; and Randers, 26,817.

**EDUCATION.** Elementary education is free and compulsory between the ages of 7 and 14. In 1924 there were 4499 lower schools, of which 34 were maintained by the government, 3834 by the local communities and 637 by private agencies. The total number of pupils in the schools was 500,270. For higher education there is the University of Copenhagen with about 120 professors and teachers and about 4000 students. There are also many popular high schools, agricultural schools, training schools for teachers, and other technical and special institutions.

**PRODUCTION.** An investigation to determine the economic status of Denmark as compared with the pre-war years was completed early in 1926 and revealed the wealth of the nation as about 20½ billion gold crowns or twice as much as before the War. The accompanying statistics show how this result was obtained:

<i>Assets</i>	<i>Millions of gold crowns</i>
Properties .....	10,800
Stocks on hand, inventories, machines, animals, equipment, etc. ....	10,000
Merchant marine and fishing fleet .....	175
Gold reserves .....	210
Railways .....	350
Harbors .....	150
Telegraphs and telephones .....	140
War materials .....	150
Antiques, etc. ....	100
Foreign assets .....	600
<b>Total .....</b>	<b>22,175</b>
<i>Liabilities</i>	<i>Millions of gold crowns</i>
Foreign debts .....	1,645
Denmark's national wealth .....	20,530
<b>Total .....</b>	<b>22,175</b>

In the distribution of the productive capital of the country by industries the transportation system accounts for approximately 800,000,000 crowns. While there are no accurate data on

the amount of capital invested in agricultural activities the value of the total equipment is estimated at three billion crowns. If the value of forestry and fisheries is included, the total capital devoted to the production of raw materials amounts to seven billion crowns, and a similar amount represents the total value for industry and trade. The accompanying table from the *Statesman's Year Book* for 1926 shows the acreage and production of the principal crops in 1924:

<i>Crops</i>	<i>Area 1924 Acres</i>	<i>Production 1924 Tons</i>
Wheat .....	148,765	159,581
Rye .....	765,550	265,021
Barley .....	745,012	745,029
Oats .....	1,140,945	917,465
Mixed grain .....	573,478	479,030
Potatoes .....	177,271	742,200

On July 15, 1925, there were in Denmark 536,000 horses, 2,758,000 head of cattle, 261,000 sheep, 2,517,000 swine, and 20,039,000 hens. The total value of the fish caught in 1924 was £2,463,000.

**COMMERCE.** According to the United States Bureau of Foreign and Domestic Commerce, a survey of Danish foreign trade for 1925 showed that imports totaled 2,095,000,000 crowns (about \$442,673,500) and exports 1,789,000,000 crowns (about \$378,015,700). As a source for Danish imports, the United States, which heretofore has been third in importance, reached second place in 1925, exchanging places with Great Britain. Germany, as in preceding years, held first place. The relative position of the principal countries that supply Denmark's importations are shown in the accompanying table, in which "other countries" in 1925 comprised, in order of importance, Norway, Belgium, Argentina, Brazil, China, Canada, India, Finland, and the Dutch East Indies.

#### DANISH IMPORTS, BY LEADING COUNTRIES OF ORIGIN [Values in million Danish crowns \*]

	1924		1925	
<i>Country of origin</i>	<i>Amount</i>	<i>Per cent of total</i>	<i>Amount</i>	<i>Per cent of total</i>
Germany .....	649	27	583	28
United States .....	294	12	350	17
Great Britain .....	446	19	307	14
Sweden .....	129	19	114	20
Netherlands .....	74		75	
Rumania .....	52		75	
Russia and the Baltic countries .....	96		73	
France .....	81	23	72	21
Other countries .....	545		446	
<b>Total .....</b>	<b>2,366</b>	<b>100</b>	<b>2,095</b>	<b>100</b>

\* The Danish crown had an exchange value in 1924, of \$0.1672; in 1925, of \$0.2113.

It was evident that Germany, though holding its position as the leading source for Danish imports, had nevertheless lost in percentage of the total, though not so heavily as Great Britain. It was also evident that the losses sustained by these two principal countries as purveyors to Denmark had been taken up by the rest of continental Europe and by the United States as increased percentages in about equal degree. The expansion in imports from the United States was most marked in the cases of wheat flour, grains, and other foodstuffs. The figures

of Danish export distribution show that Great Britain maintained its position as the largest buyer of Danish products, purchases consisting primarily of bacon, butter and eggs. In 1925 these shipments reached a value of 1,081,000,000 crowns, or approximately 60 per cent of the total exports. Germany took second place and Sweden third, as a market for Danish products. Shipments to the United States in 1925 reached a value of only 9,000,000 crowns.

**FINANCE.** The accompanying table from the *Statesman's Year Book* for 1926 is an abstract of the budget estimates for the fiscal year 1926-27:

<i>Current revenue</i>		<i>Kroner</i>
Balance of domain revenues	.....	742,067
Balance of State undertaking	.....	18,904,288
Interest (net)	.....	4,145,944
Balance of funds, etc.	.....	631,052
Direct and indirect taxes	.....	390,563,172
Balance of lotteries	.....	2,511,502
Separate revenues	.....	3,408,426
<b>Total current revenue</b>	.....	<b>381,613,741</b>
<i>Current expenditure</i>		<i>Kroner</i>
Civil list and appanages	.....	1,222,000
Rigsdag	.....	2,600,000
Council of State	.....	508,350
Ministry of Foreign Affairs	.....	6,464,264
Ministry of Ecclesiastical Affairs	.....	4,595,806
Ministry of Public Instruction	.....	71,208,234
Ministry of Justice	.....	19,002,687
Ministry of Interior	.....	73,801,262
Ministry of Labor	.....	57,084,486
Ministry of Agriculture	.....	13,293,111
Ministry of War	.....	39,279,243
Ministry of Marine	.....	24,527,882
Ministry of Finance	.....	27,823,576
Ministry of Public Works	.....	7,793,177
Ministry of Industry, Commerce, and Navigation	.....	5,439,716
Greenland	.....	208,226
Pensions	.....	15,388,529
<b>Total current expenditure</b>	.....	<b>369,689,999</b>

**COMMUNICATIONS.** The year 1925 was a difficult year for the Danish merchant marine. Freight received amounted to about \$53,750,000 or \$14,250,000 less than in 1924. During the year the tonnage was increased about 4 per cent. This increase corresponded approximately to the amount of tonnage which was laid up (47 vessels of 58,224 registered tons). In 1924, 29,031 vessels of 9,633,000 tons entered the Danish ports from foreign countries and 30,284 vessels of 9,631,000 tons cleared. In 1925, there were 3148 miles of railway open for traffic of which 1505 miles belonged to the state. In the other lines the government has a greater or less interest through the ownership of part of the capital stock.

**GOVERNMENT.** Executive power is vested in the king who acts through a responsible ministry, but who has no power to declare war or conclude peace without the consent of the Rigsdag, or parliament; and the legislative power is vested in the Rigsdag, which is composed of the Folketing (lower house), and the Landsting (upper house), the former having 149 members, of whom 117 are elected on the basis of proportional representation, and the latter having 75 members, elected indirectly by the voters for the lower house. King in 1926, Christian X (born Sept. 26, 1870), who succeeded his father, Frederik VIII, on May 14, 1912. The ministry as formed on April 23, 1924, was as follows: Premier and Minister of Industry, Commerce, and Navigation, Th. Stauning; Foreign Affairs, Count C. P. Moltke; Interior, C. N. Hauge; Jus-

tice, K. K. Steincke; Defense, L. D. Rasmussen; Education, Mrs. Nina Bang; Ecclesiastical Affairs, N. P. Dahl; Agriculture, K. M. Bording; Public Works, J. Friis-Skotte; Finance, C. V. Bramsnaes; Labor F. J. Borgbjerg.

**HISTORY.** The Socialist ministry during the month of March forced through the final reading of the Disarmament Bill, which would virtually abolish the Danish army and navy, with the exception of a few frontier guards and some small coastal vessels. The bill had been first introduced at the end of 1925 and was bitterly attacked in the Folketing by the Conservative and Liberal Parties as being unwarranted in light of the conditions existing in Europe. The measure as passed in its final reading had a bare majority of one vote (71 to 70).

On June 2, the Danish government concluded a treaty of conciliation and arbitration with Germany at Berlin. The treaty stated that in all cases arising the matters at hand should be settled by an arbitration court specifically selected for the case. A contingent provision said that in case Germany joined the Permanent Court at The Hague or was admitted to the League of Nations, disputes could be referred to The Hague after a notice given by either party. The treaty went into effect in July for a period of 10 years, after which it was to remain in force for five-year periods unless either signatory party gave notice of annulment. Another article of the treaty provided for the calling upon the King of Sweden and chairman of the arbitration commission in case both parties were unable to agree upon a mutually satisfactory chairman.

A similar treaty was signed with Poland, providing for the peaceful settlement of all disputes. A permanent mediation committee was formulated, the decisions of which, however, were not necessarily binding. In the event of dissatisfaction, an appeal could be made for a special arbitration board, the decision of which would be binding on both contracting parties. Arbitration conventions of a like nature were also signed and ratified between Denmark and Sweden and Denmark and Finland during the year.

In the autumn there were unconfirmed rumors in the press of an attempt on the part of Danish Schleswig to break away from the mother country. Premier Stauning was bitterly assailed by the agricultural interests because of the policy of heavy taxation he was compelled to carry out to attempt to balance the budget. One or two persons were arrested on the charge of inciting to mutiny and a mass meeting was held on October 10, which had the avowed purpose of appealing to the League of Nations for a consideration of the condition of Schleswig as well as for an autonomous government. The Danish government sent heavy reinforcements to the police of the community but no untoward incidents or disturbances occurred.

In the last month of the year the Stauning ministry resigned as a result of the parliamentary elections of December 2. The premier took this action without waiting for the Folketing to meet. The changes in party alignment were not very great but were sufficient to overthrow the Socialist bloc. The Conservatives and Liberals gained two seats each, and the Socialists and Radicals lost two seats each. On December 10, M. Madsen-Mygdal was appointed Prime Min-

ister, and depended upon a coalition of the Liberals and Conservatives for his position.

**DENVER, UNIVERSITY OF.** An institution of higher education at Denver, Colorado; founded in 1864. The enrollment for 1926-27 was 3544, distributed as follows: College of Liberal Arts, 1038; School of Pharmacy, 39; School of Engineering, 149; School of Commerce, 717; School of Dentistry, 235; City College (Extension Department), 570; School of Law, 85; Summer Session (1926), 811. The faculty had 190 members. The amount of the productive funds was \$1,726,830. The library contained 50,000 volumes. Chancellor, Heber Harper, D.D., LL.D.

**DE PAUW UNIVERSITY.** A co-educational institution of higher education at Greencastle, Ind., under the auspices of the Methodist Episcopal Church; founded in 1837. For the fall session of 1926, 1704 students were enrolled, of whom 925 were men and 879 were women. Of this number 1539 were registered in the College of Liberal Arts and 165 in the School of Music. In the summer session of 1926 there were 226 students. The College of Liberal Arts had a faculty of 88 and the School of Music of 15. During the year 11 new faculty members were appointed, as follows: An assistant professor in botany; an associate professor in psychology; an assistant professor in zoology; an assistant professor in political science; an instructor in English literature, an instructor in English composition, an instructor in Spanish, an instructor in mathematics, an instructor in public speaking, an instructor in German, and a dean of men and assistant in the Department of Education. The productive funds of the university were \$4,154,515.67, the income from the endowment was \$110,382.10, and the current income for the year, \$209,508.38. A gift of \$12,500 was received by the will of Mrs. Grace K. Maring, of Muncie, Ind. The building of a new dormitory for boys, Longden Hall, was begun. The library contained 64,815 volumes. President, Lemuel Herbert Murlin, LL.D.

**DERBY.** See RACING.

**DESTROYERS.** See VESSELS, NAVAL; NAVAL PROGRESS.

**DETROIT, UNIVERSITY OF.** An institution of higher education at Detroit, Mich., under the auspices of the Roman Catholic Church; founded in 1876. It is conducted by the Jesuit Fathers. In the autumn of 1926 there were 2230 students registered for the college course, distributed as follows: arts and science, 441; law, 259; commerce and finance, 890; engineering, 598. There were 465 students enrolled for the high school course. In the summer session 91 students were enrolled. The faculty numbered 190. The productive funds and income for the year totaled \$540,036.42. The library contained about 45,000 volumes. The following new buildings, estimated to cost over \$2,000,000, were under construction: Faculty residence, power house, engineering building, chemistry building, science building, recitation hall. President, the Reverend John P. McNichols, S.J., A.M., Ph.D., LL.D.

**DETROIT INSTITUTE OF FINE ARTS.** See ART MUSEUMS.

**DIABETES.** The status of the treatment of diabetes in 1926, bearing in mind the revolutionary advances made by medical knowledge in recent years, was indicated as follows in the medical clinic of Professor Wenckebach of the University of Vienna (Adlersberg and Porges

in the *Klinische Wochenschrift* for August 13): The aim of the dietetic treatment is less to underfeed and restrict food articles than to feed with those which are best tolerated—i.e., which will not increase the blood sugar, the object being to restore to the liver its normal content of glycogen. When this is accomplished the symptoms all improve. In the mild and moderately severe cases diet is all that is required, one which is relatively rich in protein and poor in fat. As for the carbohydrates, they should be selected for the tolerance shown to them and many new forms of dietetic carbohydrates have been introduced in recent years. The patient may vary their use, reduction of the sugar percentage in the urine being the principal criterion. In the severe type of case, insulin is given with carbohydrates in abundance with minimal fat and moderate protein. The better adjusted the diet the less the amount of insulin required. In some patients 20 units of the latter will clear up the urine while in another 90 may fail to do so. The authors make no allusion to the Allen fasting cure. See FOOD AND NUTRITION.

**DIAMONDS.** The production of diamonds in South Africa was active in 1926, as this industry, after gold, occupied the major position in the mineral output of the Union of South Africa. During the year there were concluded contracts between the producers and the Buyers and Sellers Syndicate and there was an inter-producers' agreement which was said to be in every way successful. There was an increase in the production from the alluvial regions of the West Transvaal, especially in the district of Lichtenburg, where a large town had developed in the latter half of the year with a population of about 80,000 people. Developments in this region indicated that the output could increase and might be a source of concern to the operations of the Syndicate and the leading diamond producers of South Africa. Diamonds were discovered on the coast of Namaqua Land, the conditions being somewhat similar to those obtaining in Southwest Africa. In the Congo the diamond mining companies had a prosperous year, with an output exceeding that of 1925. In the Congo the companies operating were the Forminière, Kasai, Beceka, and Luebo, while in Angola the Diamang Company was also producing. A new diamond mining company, the Lueta, was formed during the year. These diamond mining companies in the Kasai Region were said to employ 340 whites and 27,000 blacks. In 1926 imports into the United States were: Rough diamonds, 236,953 carats, valued at \$13,070,767 and diamonds cut but unset, 555,363 carats, valued at \$51,361,942 as compared with 171,842 carats valued at \$9,492,328 and 513,783 carats, valued at \$49,620,666 in 1925.

**DIAMONDS, RADIUM TREATMENT OF.** See CHEMISTRY, INDUSTRIAL.

**DICK TOXIN.** See SCARLET FEVER.

**DIPHTHERIA.** Although the campaign for detecting and immunizing children susceptible to diphtheria appears to be making good in some of the large cities of the country, efforts at securing immunization from swallowed antitoxin are going ahead, for with a successful outcome the drawbacks of serum sickness and anaphylaxis will be obviated. Among the workers in this field Reiter and Soldin of Berlin report their recent experience in the *Deutsche*

*Medizinische Wochenschrift* for August 6. First the principle was found to work out perfectly in small laboratory animals (guinea pigs), which first received sodium benzoate to improve the powers of absorption by the mucous membrane, and then immunizing doses of antitoxin by the mouth. The method was then transferred to a group of children who received each one gram of the salt in raspberry water, and two hours later 2 cc. of a standard make of mixed toxin-antitoxin in milk. A week later a three-fold dose of the same mixture followed and after a similar intermission a five-fold dose. Of more than a hundred children thus treated all but six bore the two medicaments well. The only available way of testing for immunity was to make the ordinary Schick test for sensitiveness to the toxin, and the results were wholly satisfactory to the investigators. The immunity lasts for at least six months. Naturally, only an actual epidemic can prove conclusive.

**DIRIGIBLES.** See AERONAUTICS; MILITARY PROGRESS.

**DISARMAMENT.** Once more the problem of the limitation of armaments is attracting the attention of the world. Investigated and discussed for five years by commissions of the League of Nations, the question was reopened by the Council of the League as a result of the conclusion of the Locarno agreements, when on Dec. 12, 1925, Senator Vittorio Scialoja, as President of the Council, invited 19 nations to participate in the work of a Preparatory Commission on the Limitation of Armaments. The nations invited included, besides the 10 which are represented on the Council (France, Great Britain, Italy, Japan, Belgium, Czechoslovakia, Brazil, Spain, Hungary, and Sweden), the United States, Germany, Poland, Rumania, the Netherlands, Finland, the Serb-Croat-Slovene State, and Bulgaria. The date originally set for the meeting of the commission was February 15, but in accordance with the wishes of certain of the countries invited, led by France, this meeting was postponed.

This commission's task will be to perform the necessary preliminary work before a general conference. It will be assisted by the League's Permanent Advisory Commission, consisting of naval, military, and air experts, and by a joint commission composed of transit, financial, and economic experts, as well as representatives of the International Bureau of Labor.

This whole question is important, not only from the point of view of international peace, but from the point of view of public finance. In practically every country the maintenance of an army or navy, or both, involves a heavy outlay of public funds. The cutting down of this expenditure is essential in certain countries for the establishment of budgetary equilibrium and in other countries for the amelioration of the burden of taxation.

Below is a table showing the expenditure of the various countries for national defense, as authorized in their budgets for the fiscal year 1925-1926:

Austria .....	\$9,758,834
Belgium .....	87,974,107
Bulgaria .....	874,769
Czecho-Slovakia .....	55,140,540
Denmark .....	12,825,296
Estonia .....	4,484,295
Finland .....	9,759,840
France .....	221,798,482

Germany .....	\$186,786,051
Greece .....	11,396,800
Italy .....	115,169,461
Latvia .....	8,786,814
Lithuania .....	5,172,700
Netherlands .....	42,005,173
Norway .....	8,888,850
Poland .....	138,876,100
Portugal .....	19,827,091
Rumania .....	21,623,254
Serb-Croat-Slovene State .....	38,220,409
Spain .....	90,820,704
Sweden .....	39,609,167
Switzerland .....	16,488,186
Turkey .....	28,373,783
Union of Soviet Socialist Republics .....	215,088,205
United Kingdom .....	559,015,000

Army strength is shown in the following table:

	Terms of service with regular army	Peace strength of army
France .....	1½ years	657,000
Russia .....	2 "	800,000
Italy .....	1½ "	308,000
Poland .....	2 "	276,000
Rumania .....	2 "	140,000
Yugoslavia .....	2 "	116,000
Czecho-Slovakia .....	14 mos.	150,000
Belgium .....	1 "	90,000
Spain .....	2 "	180,000
Greece .....	2 "	86,000

When the question of disarmament comes up for a practical solution, it is believed that the question of expenditures for military purposes will be considered along with the equally important factors of industrial capacity, geographical position, system of alliances, and the like. Upon all these factors combined, not upon an army alone, depends ultimate security against armed aggression.

On January 4, President Coolidge asked Congress for an appropriation of \$50,000 to pay the expenses of American participation in the work of the Preparatory Commission. By requesting an appropriation instead of Congressional approval of his decision to accept the Council's invitation, the President apparently rejected any implication that such approval is necessary. He advocated participation because of "the general policy of this Government in favor of disarmament and limitation of armament." He pointed out that such cooperation involves no commitment to attend the Disarmament Conference itself. Congress granted the asked for appropriation.

Finally, on May 18, the Preparatory Commission began its first session at Geneva. With the exception of Soviet Russia, all the states invited sent representatives. Hugh S. Gibson, head of the American delegation, at the opening session, read a statement in which he set forth that the American government was anxious to give cordial support to any efforts for the reduction and limitation of armaments, and urged full and free discussion of the problems before the Preparatory Commission. Though the United States had reduced its army to 118,000, or one soldier per thousand inhabitants, the American people are "not disposed to overlook the fact that other countries are differently placed and that their problems are not susceptible of such simple solution." The United States will welcome any steps leading to further limitation of naval armaments. He advocated regional agreements for disarmament rather than a

universal plan, and he urged the separation of the concrete questions from the abstract and general ones.

This latter suggestion bore fruit, in that a Drafting Committee was appointed, with Mr. Gibson as one of its members, to recast and clarify the seven complicated questions which formed the agenda, and to separate the technical and military questions from the purely political ones. The American position on regional agreements for disarmament was upheld by the delegates of Argentina, Brazil, and Chile. The Scandinavian countries, too, have for years advocated this approach. A subsequent proposal by Mr. Gibson, that the sub-committees study the possibilities of regional disarmament, was accepted.

According to careful observers, like the Foreign Policy Association, the main obstacle to the success of the Preparatory Commission was the profound cleavage between the British and the French points of view. The British thesis, expounded by Lord Cecil, was that limitation and reduction can be applied only to the actual armaments of the countries concerned, that is, to their standing armies, including reserves and material available within a very short time. M. Paul Boncour, the French spokesman, on the other hand contended that in calculating the armaments to be allowed to any nations the "potential strength," that is, the natural resources, wealth, population and industrial equipment of the nation in question, must be included. In other words, he argued that a country deficient in this potential armament should be permitted to make up the deficiency by keeping a larger standing army than its neighbors which have greater resources and are more developed industrially.

The same countries which championed the Geneva Protocol proclaimed the impossibility of any disarmament without security. It was left for the German representative to point out that security has been to a great extent achieved through the Covenant of the League of Nations, which provides for economic and military aid to the members who are victims of aggression. The French representative, more skeptical as to the efficacy of the League sanctions, secured the adoption of a proposal to ask the League Council to define its duties and accelerate its action in case of aggression or threat of war.

In connection with the French suggestions about new security plans, Count Bernsdorff, the German delegate, referred with satisfaction to M. Briand's statement in the March Assembly that Germany morally was already to be considered a member of the League Council. Count Bernsdorff said he wished to declare that Germany recognizes the necessity for an examination into the proposed methods of bringing rapid assistance to an attacked country. This examination, however, should not be based on the present position or armaments, which is only temporary, but should have as its starting point a state of general disarmament resulting from the conference.

Count Bernsdorff further declared that disarmament should be based on the principle that no country should be powerful enough to be able to assert its strength against that of the League. He urged, therefore, that League States should maintain such armament that together they could put at the disposal of the League a force

that would enable the League to execute its decisions against an aggressor.

The first session of the Preparatory Committee ended on May 26. Before leaving Geneva, upon the termination of the session, Lord Cecil said, in a statement to the press: "We have got to work and the machinery is going, but we have not as yet reached the point of establishing a scheme for world-wide disarmament." Continuing, he said that as a pure guess he did not think the Disarmament Conference could be assembled before the end of the year 1927. The Preparatory Committee had taken two positive decisions. One was that it was only peace armaments that could be limited, and in the second place it was understood that when the conference met each State would submit a definite scheme showing what armaments it needed, both as regards personnel and material, together with a statement of the grounds on which it was based.

Lord Cecil further pointed out that the committee had added two other schemes to its programme—namely, the control and supervision of armaments and an investigation into the question of chemical warfare. With regard to the possibility of a conference on naval armaments proceeding at the same time as the present disarmament discussion, Lord Cecil said he thought that if another conference were called it might appear to be competing with the present discussions, but that when these had got a little further there would be no reason why certain phases of the subject should not take a more concrete form while fitting in with such discussions. He was very much impressed with the necessity of going slow with the work of the sub-committees. The Commission will not meet again until its technical sub-committees have had time to study and prepare reports on the numerous difficult questions referred to them.

Perhaps the most important items of the report was the proposal, introduced by France, that every government should submit to the final conference "definite and quantitative proposals" in regard to their scale of armaments. The report states that it would be impracticable at present to limit the ultimate war strength of a country, and lists the various methods proposed for reduction or limitation of peace-time effectives. It also includes a proposal concerning regional disarmament, introduced by the American delegation, and proposals concerning chemical and bacteriological warfare and publicity concerning war inventions. A statement by the German delegation that the present status of armaments is temporary, and that no country must be so powerful as to be able to defy the League, is also included in the report.

The military sub-committee, on which the United States was represented by Rear Admirals Hilary P. Jones and Andrew T. Long and Brig. Gen. Dennis E. Nolan, started work immediately. General Nolan proposed a definition of armaments which constituted a compromise between the British and the French theses.

The Council of the League of Nations at its June meeting took action and decided unanimously to submit as an official document of the League a report on the limitation of armaments prepared by an American committee of private citizens. The action of the Council was doubtless partly due to the list of distinguished

Americans who have cooperated in the preparation of the document: Dr. James T. Shotwell, Gen. Tasker H. Bliss, Dr. Isaiah Bowman, Dr. Joseph P. Chamberlain, Prof. John Bates Clark, Dr. Stephen P. Duggan, Gen. James G. Harbord, Frederick P. Keppel, David Hunter Miller and Dr. Henry S. Pritchett. A personal link between this group and influential personages in Europe was furnished by the fact that Dr. Shotwell had discussed the problems in question with responsible European statesmen, cabinet members, military and naval experts and other important personages in France, England, Belgium, Italy, Germany, Austria, Hungary and Czecho-Slovakia. This American group was of course entirely unofficial, composed of private citizens who were deeply interested in the formulation of a world policy on disarmament and national security in which other nations than those within the League might have full participation.

It at once became evident that the starting point for the discussion of this problem in America was fundamentally different from the basis of European discussion. In the United States the main interest lies in policies of disarmament and the "outlawry of war"; in Europe, especially on the Continent, and more especially in these post-war years, the problem of national security takes precedence.

The military sub-committee of the Commission adjourned November 5, after six months of almost continuous work. There was no unanimity in their replies to the seven questions of the Preparatory Commission, but their findings must serve as a basis for the discussion in the Preparatory Commission, which would probably meet in the following spring after the governments had had an opportunity to study and comment upon the report. The conference probably would be delayed to give ample time for preparation and in the hope that Soviet Russia might attend.

Separation of issues in the question of disarmaments has been found impossible, according to the report of the Joint Commission on the economic aspects of certain disarmament questions. Since only the Preparatory Commission for the Conference is able to pass on such questions, the civil sub-committee of this Commission, on the proposal of Lord Cecil, voted unanimously to forward the Joint Commission's report to the Preparatory Commission without further discussion. As American views on all questions had already been expressed before the military sub-committee, further American reservation or opposition to the points at issue will be deferred till the next meeting of the Plenary Commission. The question of regional agreements was also considered as a political question, and referred to the Preparatory Commission.

Final settlement of the question of the disarmament of Germany was expected to be the fruit of the 43d session of the Council of the League. This will involve the withdrawal of the Interallied Commission on Military Control, regarded as the inevitable consequence of the Treaties of Locarno and the conference at Thoiry. The kernel of the question, however, was the degree to which Germany, in order to obtain the satisfaction of this withdrawal of control, was ready to submit to what the League Council thinks necessary in the matter of restrictions

on armament. Four points were submitted by Sir Austen Chamberlain, as conditions for the withdrawal of control from Germany, to the French, Belgian and Italian Governments: (1) Subordination of the Commander-in-Chief of the Reichswehr to the authority of the Minister of Defense. (2) Regulation of the question of recruiting and military organizations. (3) Control of the export of arms and munitions. (4) Destruction of new fortifications on the eastern frontier of Germany.

The sub-committee of the Interparliamentary Union's Committee for the Reduction of Armaments appointed to elaborate a draft plan of reduction of armaments, met in Paris in June. It presented then to the Plenary Committee a report consisting of a series of theses and declarations setting forth the principles, which in its opinions, should serve as basis to the final plan. The President of the Commission, Dr. Munch, commenced the report briefly, after which the debate was opened within the Commission. It was first of all agreed that the report of the sub-committee should be circulated to the groups, which would be asked to furnish comments within a fixed date to enable the sub-committee to prepare a final draft for presentation to the next Conference. The full Commission was to meet some days before that Conference in order to make it possible for overseas groups to be represented on it.

**DISCIPLES OF CHRIST.** A communion known also as the Churches of Christ and sprung from a movement for Christian unity, which arose in American Presbyterian circles at the beginning of the 19th century, under Barton W. Stone in Kentucky and Thomas and Alexander Campbell in western Pennsylvania. This is the largest religious body having its origin in America. It was fifth among Protestant communions in the United States in 1926. In polity the churches are congregational. There were five major agencies of this communion in 1926: The United Christian Missionary Society; Board of Education; Board of Temperance and Social Welfare; Association for the Promotion of Christian Unity; and the missionary societies of the several States and of the Provinces of Canada. These agencies are related in an advisory way to the International Convention of Disciples of Christ, which meets annually in May. The general missionary work of the churches is organized under the United Christian Missionary Society, with headquarters at 425 DeBaliviere Avenue, St. Louis, Mo. Its board of 120 managers is composed of an equal number of men and women. The foreign missionary work in 1926 embraced the Belgian Congo, China, India, Jamaica, Japan, Mexico, Philippine Islands, Porto Rico, Argentina, Paraguay, and Tibet. At the end of the year the Society had almost completed a thorough survey of the work throughout the world.

During 1926 there were 4827 baptisms in foreign fields, a gain of 777 over 1925. The 539 foreign day schools had a total enrollment of 15,204. The 18 hospitals and 24 dispensaries treated 428,797. The Church Erection fund amounted to \$2,448,862.39. Appropriations for pastoral support were made to 141 home missions churches. The Society maintained Bible chairs in four State universities. Work was conducted among the French, highlanders, immigrants, Indians, Negroes, Orientals, Spanish-

Americans, and Mexicans. The department of benevolence maintained six homes for children, six homes for the aged, and one hospital. The Men and Millions Movement reported paid pledges amounting to \$282,101.68 during the year, bringing the total up to \$5,902,246.86. In 1926, 25 colleges coöperated with the Board of Education. The imperative need for ministerial pensions brought about the creation of a commission to study the field. Statistics of the denomination for 1926 showed a total church membership throughout the world of 1,523,307 and in the United States and Canada, 1,436,575. Bible school enrollment for the world was 1,226,092; number of churches throughout the world, 9786. The total number of preachers in the United States and Canada was 6871. Contributions reported in the United States and Canada for the fiscal year totaled \$4,724,436.98. Among the periodicals published by the Disciples are: *World Call*; *Christian Evangelist*; *Christian Courier*; *Christian Unity Quarterly*. The International Convention, which meets annually, had as its president for 1926-27 E. S. Jouett, vice-president and general counsel of the Louisville & Nashville Railroad, Louisville, Ky. The president of the United Christian Missionary Society was the Rev. F. W. Burnham, St. Louis, Mo.

**DISEASES OF PLANTS.** See BOTANY.

**DIVORCE.** See MARRIAGE AND DIVORCE.

**DOCKERY, ALEXANDER M.** Former Governor of Missouri, died on December 26, at Gallatin, Mo. He was born in Davies County, Mo., on Feb. 11, 1845, and was educated in the common schools and at Macon Academy, Macon, Mo. Later, he attended the St. Louis Medical College from which he graduated as a physician in 1865. Thereafter he practiced medicine at Chillicothe, Mo., until 1874 in which year he entered the banking business at Gallatin, Mo. From 1882 to 1898 Mr. Dockery served as a Democrat in Congress, and two years later was elected governor of Missouri. In 1905 he retired from public office, but in 1913 he was recalled to public service in the capacity of third assistant postmaster general, serving through both of President Wilson's terms. While in Congress, Mr. Dockery was the author of the law concerning the bonding of United States officers, making it imperative that these bonds be examined every two years, strengthened if need be, and definitely renewed at the end of each four-year period. He put through the House the bill dissolving the contract between the Union Pacific and the Western Union Telegraph Company. He was definitely opposed to subsidies for steamships carrying mails, and was the author of the free delivery system for the smaller cities and towns.

**DODGE, CLEVELAND HOADLEY.** American financier and philanthropist, died at Riverdale, N. Y., June 24. He was born in New York City, Jan. 26, 1860, the son of William Earl Dodge, a well known business man and philanthropist, and was educated at Princeton University, graduating in 1879, in the same class with Woodrow Wilson. After his graduation from college he entered the family business of Phelps, Dodge & Company, later becoming vice-president of the Phelps Dodge Corporation. Following the traditions of his family he became in-

terested in philanthropy, not only contributing liberally to various religious and humanitarian agencies, but taking a prominent part in the management of campaigns for funds. He was the executive head of the Red Cross campaign in 1917, and directed the United War Work campaign which raised more than \$17,000,000 for the Young Men's Christian Association, the Knights of Columbus, the Salvation Army, and other religious organizations during the World War. He was an advocate of the nomination and election of his classmate, Woodrow Wilson, for the Presidency, and in both campaigns was an influential and generous supporter. He was also active in the unsuccessful campaign of John Purroy Mitchel for reelection as mayor of New York in 1917, and contributed generously to the Cox campaign in 1920.

Mr. Dodge participated actively in the campaign for the fund for Near East colleges as chairman of the executive committee, contributing \$500,000 and securing the total amount of \$2,500,000 asked for, which was devoted to the uses of Robert College, the Constantinople Women's College, American University of Beirut, the Sofia American Schools, and the International College of Smyrna. Mr. Dodge was a trustee of the Atlantic Mutual Insurance Company, a director of the National City Bank, and other commercial organizations, as well as a vice-president of the American Museum of Natural History; president of the board of trustees of Robert College, Constantinople; trustee of the New York Public Library; also the New York Zoölogical Society; and, in 1917 was treasurer of the American committee for Near East Relief. At various times he was mentioned prominently for public office, but never became a candidate.

**DOLE, SANFORD BALLARD,** Ex-president of the Republic of Hawaii and United States district judge of Hawaii Territory, died at Honolulu, Hawaii, June 9. He was born in the Hawaiian Islands, Apr. 23, 1844, the son of Daniel and Emily Dole, who were American missionaries. He was educated at Oahu College and his father's school at Koloa, Hawaii, and at Williams College, later studying law in Boston where he was admitted to the bar. Returning to Hawaii he engaged in the practice of law in Honolulu, and in 1884-86 was a member of the legislature. He participated in the reform movement of 1887, and served as judge of the Supreme Court until he was placed at the head of the provisional government in 1893, becoming president of the Republic of Hawaii in 1894, having previously refused to relinquish to Queen Liliuokalani her constitutional authority at the demand of President Cleveland. Judge Dole denied Cleveland's right to interfere, and advocated the annexation of Hawaii to the United States. In January, 1898, he visited the United States on behalf of annexation, and after this was consummated he became governor of Hawaii, serving from 1900-03, when he became United States district judge, an office he held until 1915. He was appointed by President McKinley a member of the commission to recommend to Congress legislation concerning Hawaiian territory.

**DOMINGUEZ, LORENZO.** Spanish financial leader, died in Madrid, Spain, on December 8. He was born in Seville, Spain, in 1863, and rapidly rose to a position of importance in the

Spanish financial world. For a time he served as Governor of the Bank of Spain, and for nearly thirty years was a Deputy serving the Government in connection with the Treasury and general finance. When the famous Dato cabinet was formed in 1920, Dominguez was made Minister of Finance.

**DOMINICA.** See LEEWARD ISLANDS.

**DOMINICAN REPUBLIC (SANTO DOMINGO).** A West Indian state occupying the eastern part of the island of Haiti or Santo Domingo, the smaller part being occupied by the Republic of Haiti (q.v.). Capital, Santo Domingo.

**AREA AND POPULATION.** The estimated area is 19,332 square miles; population, according to the census of 1921, 897,405. The largest cities with their populations at that census are: Santo Domingo, 30,957; Santiago de Los Caballeros, 17,052; San Pedro de Macoris, 13,802; and La Vega, 6564.

**EDUCATION.** Elementary instruction is free and compulsory and is maintained by the communes with state aid. The public schools are primary, secondary, and normal schools. According to the latest available statistics there were 972 public schools with 1544 teachers and 105,000 pupils.

**PRODUCTION.** Agriculture is the chief source of wealth, sugar cultivation being the chief industry. About 12,500 square miles of the total area are cultivable and about 3,000,000 acres are suitable for grazing. In the north central and eastern portions, tobacco, cacao, and coffee are grown, while the largest sugar plantations are in the southern part. The forest area is about 9,500,000 acres. The sugar crop for 1926 was estimated at 418,920 short tons. In the annual report of the minister of agriculture for 1925 the production of sugar was stated to be greater than that of 1924 by 176,000 tons; 1,000,000 kilos more of corn were produced; cacao showed a slight increase, while the tobacco crop increased 6,000,000 kilos, and coffee 433,720 kilos. Mineral resources of almost every kind are found to some extent within the republic.

**COMMERCE.** The total foreign trade of the Dominican Republic in the calendar year 1925 was \$52,109,603, a slight advance over the figures for 1924, when the total foreign trade was \$51,843,467. Importations in 1925 were valued at \$25,339,052 and exports were valued at \$26,770,611. The value of the exports increased by \$3,758,481 over 1924. The United States maintained its position in 1925 as the principal source of supply of Dominican imports. Sixty-two per cent, with a value of \$16,502,243, came from the United States. Porto Rico occupied second place and Germany third. Of the imports credited as coming from Germany, however, 40 per cent represented rice that originated in the Far East. The total value of the exports from the Dominican Republic in 1925 was \$26,770,611, a decrease of \$3,492,285 from the 1924 figure. This decrease is attributable to the low price of sugar, although the production of sugar in 1925 was approximately 80,000,000 kilos greater. The proceeds from the crop were more than \$6,000,000 less than in 1924. Satisfactory progress was noticed both as to volume and value in the exports of cacao, tobacco, and coffee during the year.

**FINANCE.** On Dec. 22, 1925, the Senate passed the 1926 budget, expenditures, with certain sup-

pressions, being the same as in 1925 (\$10,089,313). Total revenues were estimated at \$11,968,110. After deducting from this amount the sums due for payments of interest on the national debt and other obligations there remained a balance of \$8,006,840. Among the appropriations made from this sum was \$900,000, which was allotted for the construction of various roads and for the payment of salaries and wages of employees in the Department of Public Works. An appropriation of \$200,000 was also made for irrigation works, \$60,000 for reconstructing the building of the Department of Justice, which was destroyed by fire, and \$125,000 for pensions. After these appropriations and various others were made there remained a balance of \$952,381, which may be applied through special legislation to various uses.

**COMMUNICATIONS.** In 1924, 833 steamers of 1,110,917 tons with cargo and 172 steamers of 251,128 tons in ballast, entered in the foreign trade of the republic, and 655 steamers of 932,288 tons with cargo and 228 steamers of 293,987 tons in ballast cleared. The total length of railway lines is about 153 miles, exclusive of about 255 miles of private lines on large estates.

**GOVERNMENT.** The republic is governed under a constitution adopted by the Constituent Assembly on June 13, 1924. Executive power is vested in a president and cabinet of seven ministers. The president is ineligible for a second successive term. The senators and deputies are elected for four years by direct popular vote. Each of the 12 provinces is represented by one senator and (in practice) by two deputies. President in 1926, Horacio Vasquez, who assumed office on July 12, 1924.

**DOURINE ERADICATION.** See VETERINARY MEDICINE.

**DRAINAGE.** See RECLAMATION.

**DRAKE UNIVERSITY.** An institution of higher education at Des Moines, Iowa; founded in 1881. The number enrolled in the autumn of 1926 was 1873, distributed as follows: College of liberal arts, 642; commerce, 248; education, 400; law, 87; fine arts, 417; Bible, 79. The faculty numbered 87. The fixed endowment amounted to \$866,770. The number of volumes in the library was 45,000. President, Daniel W. Morehouse, Ph.D.

**DRAMA.** See THEATRE and articles on Literature, as LITERATURE, ENGLISH AND AMERICAN; FRENCH LITERATURE; GERMAN LITERATURE; SCANDINAVIAN LITERATURE; SPANISH LITERATURE.

**DRURY, RT. REV. THOMAS WORTLEY.** English prelate and master of St. Catherine's College, Cambridge, died at Cambridge, February 12. He was born on the Isle of Man, Sept. 12, 1847, and was educated at King William's College, Isle of Man, and Christ's College, Cambridge, where he took honors. He was ordained in 1871 after serving as curate of Kirk Braddan, 1871-73, and as mathematical master of King William's College, 1873-76. He was rector of Holy Trinity, Chesterfield, 1876-82. In the latter year he became principal of the Church Missionary College, Islington, 1882-99, where he trained students with great efficiency for the examinations of the Bishop of London, and made a name for himself in the institution. In 1899 he was made principal of Ridley Hall, Cambridge, where he served until 1907, training young men for

the church, and insisting upon sound mental discipline and application.

Dr. Drury was several times chosen as select preacher of Cambridge University, and in 1900-01 he was a member of the Fulham Conference on Confession and Absolution, and of the Royal Commission on Ecclesiastical Discipline, 1904-06, being the only Evangelical clergyman on the board of this body. In 1907 Dr. Drury was appointed Bishop of Sodor and Man, and in 1911 Bishop of Ripon. In 1915 he was a member of the War Office Committee on Chaplains, and in 1918 he was made sub-prelate of the Order of St. John of Jerusalem. In 1920 he was appointed master of St. Catherine's College, Cambridge. He was the author of a number of ecclesiastical and other works including: *Confession and Absolution*; *How We Got our Prayer Book: Two Studies in the Prayer Book*; *Elevation in the Eucharist, its History and Rationale*; *A Prison Ministry*; and *The Ministry of our Lord*.

**DUANE, ALEXANDER.** American ophthalmologist and medical writer, died at New York, June 11. He was born at Malone, N. Y., Sept. 1, 1858, and after graduating from Union College in 1878 attended the College of Physicians and Surgeons of Columbia University, receiving the degree of M.D. in 1881. He entered upon the practice of medicine in New York City, and during the Spanish-American War he served as lieutenant (junior grade) in the United States Navy in charge of the second district Coast Signal Service, and was carried in the same capacity on the reserve list of the Naval Militia in New York until 1917 when he was acting signal officer of the U. S. S. *Granite State*. In 1919 he was honored with the degree of Sc.D. from Union College, and in 1923 became a member of its board of trustees. He was a member of many medical and military societies in New York. His literary work included: *Student's Medical Dictionary* (1893), (fourth edition, 1902); *Fuchs' Textbook of Ophthalmology* (1892), (seventh edition, 1923); *Motor Anomalies of the Eye* (1897); *Rules for Signaling on Land and Sea* (adopted by U. S. Navy Department for Instruction of Naval Militia of U. S.) (1899), (second edition, 1901); contribution of medical terms to *Webster's International Dictionary* (1890); *Murray's New Dictionary of the English Language* (London); *Foster's Encyclopedic Dictionary of Medicine* (1888-94); and to works of De Schweinitz & Randall (1899); and Posey and Wright (1902), on *Diseases of the Eye, Ear, Nose, and Throat*; and Posey and Spiller, *Eye and Nervous System* (1906); and Weeks' *Diseases of the Eye* (1910).

**DUKE UNIVERSITY.** An institution for higher education at Durham, N. C.; established in 1924 by the expansion of Trinity College, made possible through benefactions from James B. Duke, as described in the article on the University in the 1925 YEAR BOOK. The enrollment for the autumn of 1926 was 1475, and for the summer session 1143. In the autumn the faculty numbered 121, 30 additions having been made beginning September, 1926. The endowment funds of the University amounted to \$27,500,000, and the income for the year was estimated at \$630,000. Eleven new buildings were in process of construction on the campus, four of which were completed and occupied dur-

ing the year, the remainder to be ready for occupancy by June 1, 1927. The University received the Angier B. Duke Memorial Loan for Students, amounting to \$330,000. President, William Preston Few, Ph.D. LL.D.

**DULA, ROBERT B.** American tobacco manufacturer, died in New York City, April 27. He was born at Lenoir, N. C. in 1849, and was educated at the University of North Carolina. He served in the Home Guards during the Civil War and, after moving to the west, settled in Missouri where he first taught school, and then went into the tobacco business at Wentzville, Mo. His activity here led to his association with the Drummond Tobacco Company of St. Louis, of which he had charge from 1886-98 when the business was taken over by the American Tobacco Company. During his life in St. Louis, Mr. Dula was active in public affairs, serving on the World's Fair Commission, the school board, and the boards of several financial institutions, as well as evincing interest in church work. In 1903 he came to New York as vice-president of the American Tobacco Company in charge of the operating department where his knowledge of the tobacco industry was an important factor in the growth of this company. Here he was associated with the president, James B. Duke, and was active until the company was broken up in 1911 when he retired from active participation in the tobacco business, retaining only his directorship in the Liggett & Myers Tobacco Company, of which his brother, Caleb C. Dula, was president.

**DUNKERS or DUNKARDS.** See BRETHREN, CHURCH OF THE.

**DUNN, ARTHUR WALLACE.** American newspaper correspondent, died at Washington, D. C., November 2. He was born in Meeker Co., Minn., on Feb. 11, 1859, and began his newspaper career on the *Grand Forks, (N. D.) Plain Dealer*, in 1883. In 1889 he went to Washington as the correspondent of the *St. Paul Pioneer Press*, later acting for the *Portland Oregonian*. In 1893 he was placed in charge of the congressional staff of the Associated Press in Washington, which position he held until 1906. For many years he sent a daily letter on Washington topics to the American Press Association, and he was a contributor to the *Review of Reviews*, *World's Work*, and other magazines. He was an organizer of the National Press Club and had been a member of the Gridiron Club since 1901, serving as president of the Gridiron in 1906. Shortly before his death he became the Washington correspondent of the *New York Graphic*. He was the author of *Gridiron Nights*, *Frontier Facts and Fiction*, and *How Presidents are Made*.

**DUNRAVEN AND MOUNT-EARL.** WINDHAM HENRY WYNDHAM-QUIN, FOURTH EARL OF. English politician, died in London, England, on June 14. He was born at Adare Abbey, Feb. 12, 1841, and was educated at Christ Church College, Oxford, where he was a lieutenant in the Oxford University Rifles, 1860-61. In 1865 he entered the Army and in 1867 he was war-correspondent for the *Daily Telegraph* in Abyssinia, serving in the same capacity during the Franco-Prussian War and the Siege of Paris. In 1868 he was aide-de-camp to the Lord Lieutenant of Ireland, and Under Secretary to the Colonies for the period 1885-87, in the Salisbury ministry. From 1888 to 1890 he was chairman of the House of Lords Committee to in-

investigate industrial sweating. In 1899 he was made an Irish Privy Councilor, having served as His Majesty's Lieutenant for County Limerick in 1894. He was chairman of the Irish Land Conference in 1902-1903, and was made C. M. G. in 1902. He was President of the Irish Reform Association, and served in South Africa as Captain of the 18th Battalion of Imperial Yeomanry Sharpshooters. In the engagements fought he won the Queen's medal with two clasps.

He was an enthusiastic yachtsman and twice built a sailing yacht in an attempt to win the America's Cup in the United States. With *Valkyrie II* in 1893 and *Valkyrie III* in 1895, he unsuccessfully competed for this trophy in the waters of New York Bay. The latter attempt resulted in a controversy due to charges being made against the American yacht. Lord Dunraven was an honorary Captain in the Royal Naval Reserve, and wrote on navigation and other subjects. He was honorary colonel of the 5th Battalion of the Royal Munster Fusiliers, disbanded in 1922. He received the Order of the British Empire, and on the formation of the Irish Free State he became a Senator. He wrote much and among his publications are: *The Great Divide: the Upper Yellowstone* (1874); *The Irish Question* (1880); *Canadian Nights* (1914); and *Past Times and Pastimes* (1922).

**DU PONT, COLONEL HENRY ALGERNON.** American soldier and politician, died on December 31, at Wilmington, Del. He was born at Eleutherian Mills, Newcastle County, Delaware, July 30, 1838. He received his early education in private schools, and later attended the University of Pennsylvania, but left in his junior year, to join the United States Military Academy at West Point, whence he graduated at the head of his class in July, 1861. He was commissioned a second lieutenant in the U. S. Corps of Engineers, and entered service with the Union Army in the Civil War. Within a year he had won a captaincy on the field, and before the end of the war was made brevet major, "for gallant and meritorious service at the Battles of Opequan and Fisher's Hill." He was brevet lieutenant colonel "for distinguished services at the Battle of Cedar Creek, and he received the Congressional Medal "for most distinguished gallantry and voluntary exposure to the enemy's fire at a critical moment," during the Cedar Creek engagement. He took part in many other engagements and skirmishes. In 1875 he resigned from the army after having been in command of Fortress Monroe. Colonel du Pont became president and general manager of the Wilmington and Northern Railway Company in 1879, and after 20 years as a railroad head he retired to his estate and busied himself with farming and politics. He was an unsuccessful candidate for the United States Senate, in 1895, but in 1899 again made the contest against the same opponent, J. Edward Addicks. A deadlock having occurred, the colonel refused again to be a candidate. In 1905, however, after a special election in the Legislature, Colonel du Pont was elected senator. Thereafter until 1917 he was a Senator continuously. During his 10 years in the Senate he did most of his work in committee and in the party councils. He became Chairman of the Committee on Military Affairs. His political life was a stormy one, in part owing to his private wealth, and the sug-

gestions of corruption which were leveled at him. In 1911, Senator Reed of Missouri challenged his election to the Senate but Colonel du Pont's right to the seat was upheld. He was defendant in a Government suit in 1911, the Government alleging that the du Pont Powder Company and 28 others maintained a combination in restraint of trade, in violation of the Sherman Anti-Trust Act. The company was found guilty but the bill against Colonel du Pont and numerous other individual defendants was dismissed. The colonel was also cited in connection with the Reading Company's railroad and mines case, but he was individually absolved.

**DUTCH EAST INDIES.** A possession of the Netherlands in the East Indies, comprising the territory of Dutch East India and consisting of the group of islands in the Pacific lying between 6° N and 11° S, and between 95° and 141° E longitude. Capital, Batavia.

**AREA AND POPULATION.** The usual method of dividing the colony is as follows: (1) Java and Madura, divided into 17 residencies, each under a resident and several assistants at the head of a large number of native officials; (2) the outposts, consisting of Sumatra, Borneo, Celebes, a part of New Guinea, the Molucca Archipelago, the Sunda Islands and other small islands, under functionaries variously entitled governor, resident, controller, etc. The area is estimated at 733,642 square miles; population, according to the census of 1920, 49,350,834. In the same year the Europeans numbered 169,708, and the Orientals, other than native, 876,506, mostly Chinese and Arab.

**PRODUCTION.** The harvested area in acres under various native crops in 1924 was as follows: Irrigated rice, 7,402,810; non-irrigated rice, 955,265; maize, 4,356,773; cassava, 1,822,345; sweet potatoes, 445,704; groundnuts, 476,413; soya beans, 417,861; other pulses, 509,872; tobacco (native), 488,794; other secondary crops, 1,453,849; total, 18,329,684. In the same year 423,626 acres were under sugar; the total production amounted to 1,997,068 tons; and the number of factories engaged in the preparation of the product, 181. The production of other products was: Coffee, 42,900 tons; rubber, 90,291,000 kilos; cinchona, 11,321,000 kilos; tobacco, 51,963,000 kilos; cacao, 1,051,000 kilos; tea, 56,902,000 kilos; and oil palms, 4,924,000 kilos of oil. The total yield of the tin mines worked by the government and private concerns in 1924 was 32,051 metric tons. In the same year the yield of the principal coal mines in Java, Sumatra, and Borneo, was 1,470,362 metric tons. Petroleum and other mineral oils in 1924 was 2,925,768 thousands of kilos. While the greater part of the soil of Java is claimed by the government, private estates are found chiefly in the western part, and mainly in the hands of the Europeans and Chinese.

**COMMERCE.** According to the United States Bureau of Foreign and Domestic Commerce the import trade of the Dutch East Indies in 1925 continued the definite upward trend which was established the previous year. Those items which are recorded by value, including textiles, registered an increase of 32 per cent in the first three-quarters of 1925, compared with the same period in 1924. Those recorded by weight showed an increase of 4 per cent. Articles entered in litres, however, showed a decrease of 17 per

cent, largely accounted for by decreased imports of kerosene. An estimate places the 1925 imports into Java at more than \$1,000,000 above those of 1924. The percentage of increase in 1925 of imports into the outlying districts, or outer possessions, was much greater than in Java and Madura. In the outlying districts, higher prices for products benefit the individual native to a much greater degree than in Java, where the percentage of direct production by natives is lower, most of the export produce coming from European-owned estates. For purposes of comparison, the total export trade of 1924 was 1,557,329,000 florins and the total import trade, 714,018,000 florins.

**FINANCE.** The budget estimates in 1925 were: Revenue, 653,155,229 guilders; expenditures, 694,001,913 guilders; deficit 40,846,684 guilders. For 1926, the figures were: Revenue, 661,449,087 guilders and the expenditures, 713,657,021 guilders, leaving a deficit of 52,207,934 guilders. The public debt on Dec. 31, 1925, was 1,104,122,000 guilders.

**COMMUNICATIONS.** In 1924, 10,198 steamers and 7741 sailing vessels of 7,280,755 and 432,012 tons respectively entered the ports of the Dutch East Indies. At the end of 1925 there were 4138 kilometers of railways. Of these 2857 were on the island of Java, 1234 kilometers in Sumatra, and 47 kilometers in the Celebes. The total book value of the roadbed at the end of the year was 417,190,835 florins. Receipts of the state railways from all sources during 1925 amounted to 74,592,883 florins, or about 4,600,000 more than in 1924. (The florin in 1925 had an average exchange value of \$0.4016.) The receipts from passenger traffic showed an increase for the first time since 1921, reaching 24,533,641 florins as against 24,087,833 florins in 1924. The revenue from the ordinary freight was considerably above that of 1924, when the income from this source was only 39,133,323 florins. The net income of the state railways for the year, after deductions for renewals, repairs, depreciation, and retirement funds, was 21,637,589 florins; the net revenue for 1924 was 18,211,126 florins. The ordinary operating expenses in 1925 were 47,281,710 florins and 45,702,250 florins in 1924. The increase was due largely to the new general wage and salary scale which was adopted by the government in February, 1925, but the introduction of changes and improvements in the periods of service and rest also contributed to making operation more expensive.

**GOVERNMENT.** The territory is under the sovereignty of the Netherlands (q.v.) but is partly under direct government and partly under subject native officials. The chief executive authority is the governor-general who is aided by a council of five members which acts partly as a legislative and partly as an advisory body. The governor-general and the council are nominated by the crown. Governor-General in 1926, Dr. de Graeff, appointed Mar. 26, 1926.

**DUTCH GUIANA, GE-IL'na. or SURINAM.** A possession of the Netherlands on the north coast of South America lying between French Guiana on the east and British Guiana on the west, bounded on the south by inaccessible territory reaching to the Tumuc-Humac mountains. Area, 54,291 square miles; population, Dec. 31, 1924, 135,754, including Negroes and Indians. Capital, Paramaribo, with 44,772 inhabitants.

The movement of population in 1924 was: Births, 3836; deaths, 1906; marriages, 403. Among the chief products are sugar, cacao, bananas, coffee, rice, maize, rum, and molasses. Gold production in 1924 was 322,671 grammes, and that of balata, 550,501 kilos. The foreign trade amounted to \$7,702,521 in 1925, an increase of \$1,800,164 or about 30 per cent over 1924. The exports amounted to \$3,972,910 in 1925, as against \$2,963,776 in the previous year and imports increased from \$2,998,581 in 1924 to \$3,789,611 in 1925. The increase in the value of the exports was due to increased production of coffee, sugar, and bauxite, and also to the increased prices received for cacao and balata. The increase in the value of imports was general, the more important gains being in food-stuffs, except rice, dry goods and clothing, machinery, mineral oils and tobacco. Imports from the United States were valued at \$1,206,557 and exports to the United States were valued at \$715,791. The executive authority rests with a governor and an assisting council, both nominated by the crown. Governor in 1926, Baron van Heemstra, who was appointed in December, 1920.

**DUTCH REFORMED CHURCH.** See REFORMED CHURCH OF AMERICA.

**DUTCH WEST INDIES.** The name applied to the Dutch possessions in the West Indies, viz., Dutch Guiana (q.v.) and Curaçao (q.v.).

**DYESTUFFS.** See CHEMISTRY, INDUSTRIAL.

**DYNAMO-ELECTRIC MACHINERY.** The year was notable for the installation of generators of large capacity, especially in public service stations. The New York Edison Company at the close of the year was installing at its 14th Street Station two single-shaft steam turbo-generators each of 60,000 kw. capacity. The ultimate generating capacity of this station was to be 700,000 kw. At the same plant this company completed the installation of a 40,000 kva. frequency changing set consisting of two generators on the same shaft capable of converting 50,000 hp. from 25-cycle to 60-cycle frequency. The armature of this machine weighed 113 tons, each rotor being 13 ft. in diameter and 20 ft. long. Another large generator was under construction for the Hudson Avenue Station in Brooklyn, New York. This was a cross-compound, 80,000 kw., 90-per cent power factor steam-turbo unit. Each generator was rated at 44,450 kva., 13,800 volts, 3-phase and 60 cycles, and it was expected that the machine would be placed in service during 1927. In Chicago, at the Crawford Avenue Station of the Commonwealth Edison Co., there was in process of erection a 77,000-kw., cross-compound turbo-generator, that would weigh complete 101,648 lb. Another unit on order for this station was to be of 90,000-kw. capacity.

The American Brown Boveri Electric Corporation was building a generating unit of 160,000-kw. capacity at 85 per cent power factor. This was to be the eighth unit for use in the Hell Gate, New York City, station of the United Electric Light & Power Co. (part of the Edison-United System) and when installed, would give this plant a total capacity of 445,000-kw. This machine was calculated to weigh when completed 2,800,000 lb., the heaviest piece to be erected weighing 330,000 lb.

The Buffalo, N. Y. General Electric Co. put in service a 60,000-kw. single unit generator

at its Charles R. Huntley Station during the year. Several generating units of even greater capacity than those mentioned were on order, but it was unlikely that they could be installed before 1928. At one of the meetings of the American Institute of Electrical Engineers, M. Eduard Roth stated that European engineers were confident that it was practicable to build 50-cycle turbo-alternators of more than 100,000-kva. capacity at 1500 r.p.m. and for 40,000 kva. at 3000 r.p.m.

For industrial plants, large motors were installed on an increasing scale. The Kokomo (Ind.) Steel & Wire Co. discontinued the use of steam engines for their rod mill and put in four wound-rotor induction motors of 1,200, 900, 1300, and 1500 hp. respectively. In the blooming mill of this company the steam engine formerly used was replaced by a direct-current, reversing roll motor of 3500 hp., 700 volts; a compound-wound machine designed to operate at between 50 and 120 revolutions per minute. An interesting detail of this large motor was the method of control, which was accomplished by means of two foot pedals for the speed and direction of rotation, each pedal, through the medium of a master switch, energizing the proper controls for these purposes. Rolling mill motors of as great as 7000 hp. were in use in large steel plants.

In descriptions of the large turbo-generators now common, confusion arises unless it be stated that the unit was a single machine, or a cross-compound. In the latter case two generators, one driven by a high-pressure turbine and the other by a low-pressure turbine, comprise the set.

**DYSENTERY.** In a paper by Dr. Louis A. Buie of the Mayo Foundation (*Journal of the American Medical Association*, October 16) on chronic ulcerative colitis, a somewhat rare affection closely resembling the dysenteries, the author announces his belief that the cause, which has hitherto defied research, is a micro-organism first described by Barger in 1924—a lancet shaped, gram positive diplococcus. However, the disease cannot be placed among the bacillary dysenteries, for infection according to the author does not take place from direct contact with the mucous membrane of the colon, but through the blood stream, which partly explains the relative infrequency of the disease and the fact that it does not become epidemic. A mixed form may result from local superinfection with the causal agent of amebic dysentery. During a period of two years 132 cases of chronic ulcerative colitis were treated at the Mayo Foundation, and although the disease naturally has a high mortality the results obtained show that this can be overcome. The real danger to life appears to lie in a secondary infection of the small ulcers which characterize the disease with ordinary pus-formers, which at once adds several threatening complications and gives the disease its pernicious quality. Surgery alone can save life at this stage of the disease. Only four of the 132 patients were known to have died thus far, although 18 others had not been heard from since discharge.

In regard to amebic dysentery the discovery that the *endameba histolytica* can be readily cultivated in a test-tube, which was announced in 1925, has led to further progress in this direction as announced in an editorial in the

*Lancet* for October 9. Dobell and Laidlaw recently made instructive experiments with such cultures, which are not only of great value in diagnosis for identifying the presence of the *endameba* in the stools but furnish an opportunity for the comparative study of remedies. It was found that emetine, the most useful remedy in amebic dysentery, can destroy in high concentrations, while even in feeble ones it possesses the power of slowly poisoning the micro-organism. It cannot be, however, understood why some patients with this form of dysentery do not respond in the least to this treatment. Cephaelin, the other chief alkaloid of ipecacuanha, is more toxic in the test-tube but less efficient clinically. Some cases as is well known, even severe and obstinate ones, are curable with a few enemas containing each one grain of emetin. According to the *Lancet* no disease has so many healthy carriers as amebic dysentery for it is estimated that in England alone there are 2,000,000 of these. Yet in all of this material only some two cases develop annually on English soil.

**DZERZHINSKY**, dschër-sin'ski, FELIX E. Chairman of the Supreme Economic Council in the Soviet Government, died at Moscow, Russia, July 20. Little is known of his early history, but it is assumed that he was active as a revolutionary in the days of the Nihilists and it was stated that he had spent 11 years in prison. Having been exiled to Siberia in 1914, in March, 1917, at the time of the revolution, he was a convict in a mine beyond the Ural Mountains, and being freed returned to European Russia. He was in Petrograd at the time the Provisional Government was swept away and the Bolsheviks gained power. Even before the Bolshevik revolution he had been elected to the Revolutionary Committee of the Bolsheviks, and after the consummation of the revolution he became connected with the administration of justice in a position somewhat similar to that of attorney general. It was here that he developed the idea of the Cheka as an agency both for the apprehension and trial of alleged enemies of the state and their judgment, and his scheme was approved by Lenin. This organization was effectively developed; a remarkable organization involving a spy system and a reign of universal terror as the judgments of its head were marked by severity and cruelty.

Dzerzhinsky was never popular with the masses, but his associates adored him as a man of power and organizing skill. On the day of his death he delivered a speech opposing Trotsky and his other opponents and justifying the methods that the administration were employing in remedying the defects of the Soviet industrial organization. At the end of his speech, which received great applause, Dzerzhinsky complained of feeling faint and returning to his apartment in the Kremlin fell dead. At the time of his death Dzerzhinsky was chairman of the Supreme Council of National Economy of the Soviet Republic, having been promoted to this activity from being head of the Cheka. At that time he was a member of the Central Committee of the Russian Communist Party, of the All-Russian Executive Committee and of the Soviet of Labor and Defense of the Russian Soviet Republic, of the Federation Central Executive Committee and the Soviet of Labor and Defense of the Soviet Federation. He possessed great in-

fluence over Lenin and he developed the Cheka to where its force and remorselessness were irresistible, and finally he occupied one of the posts of connection between the Third International and the Russian Communist party and the Union of Socialist Soviet Republics.

**EARTH, NATURE OF.** See SEISMOLOGY.

**EARTH, STUDY OF.** See GEOLOGY.

**EARTHQUAKES.** It is estimated that an earthquake is felt in some part of the world on an average of 4000 times annually; in the United States alone, one or two hundred usually occur each year. Fortunately, the vast majority of these are feeble and harmless, or else occur under the sea or in thinly populated districts. The year 1926 had the usual quota of quakes, many of which caused considerable damage and loss of life locally, but no great outstanding disasters occurred.

A number of villages were demolished, and many lives lost, in Sumatra during a series of shocks in June and July. Egypt and the islands of the Mediterranean and the Aegean Seas were shaken, June, 26-27, Crete and Rhodes being badly damaged; the Eolian Islands experienced a further shock on August 21. Destructive shocks damaged Foggia in southern Italy, June 28; and Horta in the Azores, August 31. A series of violent quakes in the Alexandropol district of Armenia (an active earthquake centre) during October and November destroyed many villages and occasioned considerable loss of life. Southern California was shaken by a moderately severe quake on June 29. See SEISMOLOGY; GEOLOGY.

**EAST AFRICA PROTECTORATE.** See KENYA COLONY.

**EBERLEIN,** ãhër-lin, GUSTAV. German sculptor, died at Berlin, February 5. He was born at Spiekershausen, Hanover, in 1847 and after studying at the Art Academy of Nuremberg worked at Berlin under Blaaser, a pupil of Rauch. After studying in Rome he returned to Berlin, where he became identified with the so-called realistic group of sculptors of which Reinhold Begas was the chief representative. His early important works were "Boy Extracting a Thorn" in the National Gallery, Berlin, the "Greek Flute Player," and "The Secret." Among his religious pieces were groups depicting the life of Adam and Eve, while he did the frieze of the Berlin Ministry of Public Instruction which contained 50 life-size figures. He was celebrated for the number of public monuments such as those of Emperor William I at Elberfeld, Mannheim, Altona, and Ruhrort; Bismarck at Krefeld; Richard Wagner in Berlin; and Goethe in Rome. He also did heroic statues of Queen Louise at Tilsit and King Frederick I and Frederick William III in the Siegesallee, Berlin. In 1892 he wrote: *Aus eines Bildners Seelenleben, Plastik, Malerei und Poesie.*

**ECLIPSES.** See ASTRONOMY.

**ECONOMIC ENTOMOLOGY.** See ENTOMOLOGY, ECONOMIC.

**ECONOMICS.** See LABOR; FINANCIAL REVIEW; INSURANCE; STRIKES AND LOCKOUTS; and other articles on economic topics.

**ECUADOR,** êk'wâ-dôr. A South American republic on the northwest coast of the continent between Colombia on the north and Peru on the south. Capital, Quito.

**AREA AND POPULATION.** The area in 1926 was still undetermined because of the boundary dispute with Peru, but was variously estimated by

six different authorities at from 116,000 to 276,000 square miles. The population has been recently estimated at approximately 2,000,000, about three-quarters of whom were Indians and the remainder of mixed blood. The last official census in 1903 placed the population at 1,328,821. The chief towns with their populations are: Quito, 80,702; Guayaquil, 100,000; Cuenca, 30,000; Rioamba, 12,000; and Ambato, Loja, and Latacunga, each with about 10,000 inhabitants.

**EDUCATION.** Elementary instruction is free and compulsory. No later statistics are available than those given in the preceding YEAR BOOK, when there were 1488 schools in operation, 1170 of which were government schools, 127 municipal, and 191 private. The total attendance was 101,378 and the number of teachers 1838. Institutions of higher learning include Central University at Guayaquil, and Azuay University at Cuenca, and a Law College at Loja.

**PRODUCTION.** The chief source of wealth of the country is cacao. The production in 1924 was 564,840 hundredweight as compared with 546,948 in 1923. Other crops are coffee, rubber, ivory nuts, tobacco, and sugar. Ecuador has practically monopolized the manufacture of Panama hats, which are produced at the rate of 700 dozen per month. The mineral resources include gold, silver, petroleum, copper, iron, lead, coal, and sulphur, but mining is almost exclusively confined to gold, of which practically the whole output is exported to the United States.

**COMMERCE.** The accompanying material on the commerce of Ecuador was published in 1926 by the Pan American Union. The total foreign trade of Ecuador for the year 1924 amounted to 113,270,860 sucres, represented by imports to the value of 52,002,941 sucres, and exports of 61,267,919 sucres. For the preceding year, 1923, the figures were: Imports, 36,804,758 sucres; exports, 38,386,359 sucres; total, 75,191,117 sucres. There was, therefore, an increase in imports of 15,198,183 sucres, and in exports of 22,881,560 sucres, or a total increase in the trade of 38,079,743 sucres.

Expressed in United States currency, estimating the sucre at 48.6 cents (10 sucres = £1); the foreign trade in 1924 was: Imports, \$25,273,429; exports, \$29,776,209; total, \$55,049,638. The figures for the year 1923 were: Imports, \$17,887,112; exports, \$18,655,770; total, \$36,542,882.

TEN-YEAR TABLE OF FOREIGN TRADE

Year	Imports	Exports	Total
1915	\$8,408,143	\$12,895,069	\$21,303,212
1916	9,330,171	17,569,691	26,899,862
1917	10,176,887	16,309,195	26,486,082
1918	8,111,690	13,364,774	21,476,464
1919	11,667,736	21,005,191	32,672,927
1920	21,138,476	24,247,478	45,385,954
1921	11,414,285	16,506,885	27,921,170
1922	16,243,499	22,407,980	38,651,479
1923	17,887,112	18,655,770	36,542,882
1924	25,273,429	29,776,209	55,049,638

**FINANCE.** The revised national budget for the year 1926 as approved, provided for receipts and expenditures to balance at 41,988,000 sucres. Principal receipts are from export and import duties and the estimated funds from this source were 11,000,000 sucres. The chief items of expenditure were 9,000,000 sucres for public works and 7,400,000 sucres for the army. A new customs tariff law was established in Ecuador by decree of the provisional president and became effective on June 10, 1926, in regard to export

duties and on July 1 in regard to import duties. The primary purpose of this tariff revision is to augment the revenue of the government which has suffered from the downward trend of the sucre during the past few years. A secondary motive is the protection of such industries as have been established in the country, including woolen and cotton mills, shoe factories, and a nail factory. Duties on exports have been reduced in order to promote the country's export trade. An important feature of the new tariff is the change in form and structure of the schedules, and the new provisions for customs procedure. The rather archaic form of the old tariff has been abandoned and in its place is one more logical, systematic, and up to date.

**COMMUNICATIONS.** For the year ended June 30, 1925, 488 vessels of 1,178,010 tons entered at the port of Guayaquil and 486 vessels of 1,181,381 tons cleared. The steamships of nine European lines visit Guayaquil by the way of Magellan Straits, and the port is also visited by steamers plying on the Pacific Coast. In 1923 the total length of railways in operation was 413 miles.

**GOVERNMENT.** Executive power is vested in a president elected for four years, who acts through a cabinet of five ministers, and legislative power in a congress of two houses, a senate of 32 members and a chamber of deputies of 48 members. At the beginning of 1926 there was no president because of the coup d'état executed on July 9, 1925.

**HISTORY.** As noted in the preceding YEAR BOOK, there was a bloodless revolution on July 9, 1925, which succeeded in driving the constitutionally elected president, Dr. Don Gonzalo Cordova, from office. A military junta was established under the leadership of General Gomez de la Torre, Luis Napoleon Dillon, and José Rafael Bustamante. This military government established Modesta Larrea Jijon as premier and held power throughout the remainder of the year, and it was not until January 13, 1926, that the military government was replaced by a civil organization. On April 2, Dr. Isidro Ayora became the head of the council of government of Ecuador, to hold office until May 24, when the constituent assembly was to elect a president to succeed the overthrown Dr. Cordova. At the end of the year, however, he was still acting president. About the same time it was announced that Professor Kemmerer, of Princeton University, was engaged by the government to reorganize the state financial system. He had already accomplished considerable results in reorganizing the financial systems of Poland, Colombia, and Chile, and was expected to go to Bolivia after his work in Ecuador was completed.

It was announced in the spring that important archaeological explorations had been made in the Huaca Mountains in the province of Carchi, where bones and pottery of prehistoric ages had been unearthed. The government planned to organize an expedition on a large scale to completely explore the region.

**EDGEWORTH, FRANCIS YSIDRO.** British economist and emeritus professor of political economy at Oxford, died at Oxford, February 14. He was born at Edgeworthstown, Ireland, February 8, 1845, and after studying at home attended Trinity College, Dublin, and Balliol College, Oxford, where he took honors. He was lecturer on logic, and afterwards Tooke Professor

of Political Economy at King's College, London, holding the latter chair until 1891. He was a fellow of King's College, London, also of All Souls College, Oxford, becoming professor of political economy at Oxford, a chair he held until he was made emeritus. He was a fellow of the British Academy and at one time president of the Royal Statistical Society, and joint editor of the *Economic Journal*. He had a wide range of learning, being not only an accomplished mathematician and deeply read in foreign literature and the classics as well as in economics, but also manifested a keen interest in the developments of the physical sciences. He was the author of: *Mathematical Psychics* (1881); articles on Probabilities, Statistics, and Economics in the *Philosophical Magazine*, *Journal of the Statistical Society*, *Economic Journal*, and other periodicals.

#### EDUCATION IN THE UNITED STATES.

**ENROLLMENT AND ATTENDANCE.** At the end of 1926 the latest available statistics for Education was for the school year ending June, 1924. The United States Bureau of Education reported enrollment and attendance as follows: Enrolled in public and private kindergartens 618,819 pupils, of whom 564,363 were in public school kindergartens. The number of pupils in private kindergartens had gradually decreased, while the numbers in public institutions had greatly increased. Reports showed, however, that less than 13 per cent of children of kindergarten age (four and five years) were enrolled. The average daily attendance in both public and private institutions was 366,718. In the public kindergartens the average daily attendance was about 59 per cent. In kindergartens where tuition is often charged the attendance was about 67 per cent of the enrollment.

The enrollment in the public elementary schools in grades one to eight inclusive was 19,891,087. The enrollment reported for private and parochial elementary schools was 1,473,145. Of each 1000 pupils enrolled in the public elementary schools 206 were in the first grade. For the next three grades the enrollment was fairly uniform being 139 for the second grade, 138 for the third and 133 for the fourth. The compulsory school attendance laws in some states are such that children may withdraw when they have reached the age necessary to attend the fifth grade and only 120 of each thousand were enrolled in this grade. The decrease in enrollment from the fifth grade on was very pronounced. In the sixth grade there were 105 of each thousand, in the seventh grade 91 and in the eighth grade only 68 remained. About one-half of the children who entered the elementary school remained to complete the eighth year.

The United States Bureau of Education compiled statistics relating to the enrollment of 1,877,949 colored children in 16 states. Among each 100 children who were enrolled in the eight grades of the elementary school 34 were in the first grade, 17 in the second, 15 in the third, 13 in the fourth, 10 in the fifth, 6 in the sixth, 4 in the seventh and only 1 in the eighth grade.

The public schools were in session an average of 168 days, and the average pupil attended 132.5 days.

A total of 3,176,074 high school students were reported. The number of secondary students had doubled since 1915. Of each thousand students 392 were in the first year, 271 in the second

year, 192 in the third and 145 remained in the fourth year. At no previous time had the high schools carried as many of the students through the entire four years. When the class that was graduated in June, 1924, entered school in September, 1913, there were 3,922,183 pupils. When this class reached the last year of the elementary school in 1920 there were 1,220,012 pupils. Of this number, it was estimated that 1,019,686 entered the high school, and 459,156 continued through the entire four-year course.

For the school year ending in June, 1924, a total of 2124 private high schools and academics reported to the United Bureau of Education. Of these, 1553 were denominational and 591 were non-sectarian. The denominational schools reported 160,418 students and the non-sectarian 57,998.

The cities of 10,000 population and more reported 696 junior high schools with an enrollment of 499,964 students and an average daily attendance of 428,722.

In the cities of 10,000 population and more there were 2155 special schools for the deaf, the blind, the feeble-minded, etc. These schools enrolled 72,176 pupils and had an average daily attendance of 59,891. Of these cities 422 reported night schools and 126 Americanization classes. The enrollment in the Americanization classes was 182,814.

**TEACHERS.** The kindergartens and elementary schools employed 617,078 different teachers while the high schools and local normal schools and vocation schools employed 144,230 teachers. This made a total of 761,308 who were employed during the school year. There were 748,309 teaching positions. In the public high schools there was one teacher to every 22 students. In the private high schools each teacher had only about 14 students.

**INCOME.** The total revenue receipts for the State school systems for the school year ending June 30, 1924, were \$1,618,437,825. This was derived as follows: From permanent school funds and leases of school lands 1.5 per cent, taxation and appropriations 93.8 per cent, and from other sources 4.7 per cent. Of money raised by taxation 16.3 per cent came from the state, 10.2 per cent from the county, and 73.5 was derived from local taxation.

There was wide variation among the States in regard to the sources from which the school funds were derived. Delaware secured 77.3 of its receipts from taxation from the State and the remainder from local taxation. Kansas on the other hand depended upon State taxation for only four-tenths of one per cent of its receipts, the remaining 96.6 per cent of the receipts from taxation was from local taxation. Louisiana secured 70.8 per cent of its receipts from taxes from the county and only 2.3 per cent from local taxation.

**COSTS.** The value of all property used for school purposes totaled \$3,744,780,714. The value of sites and buildings was \$2,783,980,933 and the value of equipment was \$279,288,113. The value of school property per pupil enrolled varied from \$39 in Mississippi and Georgia to \$272 in Nevada. The average for the country was \$154.

The school bonds outstanding and other forms of debts amounted to \$1,446,621,583 against which there were sinking funds amounting to \$82,839,791. It appears therefore that only a

little more than half of the school property was free from debt. The public schools paid interest amounting to \$58,962,573 and \$8,908,508 was transferred to sinking funds. The total amount paid on indebtedness was \$90,055,335. Only four states reported no indebtedness. These were: Connecticut, Kentucky, Louisiana and Maine.

The total current expenses, excluding outlays for new buildings, sites and equipment were \$1,432,274,793, divided as follows: General control 3.8 per cent, instruction 70.3 per cent, and miscellaneous current expenses 25.9 per cent.

The outlays for new buildings, sites and new equipment were \$388,409,143 and the payments on debts including sinking funds were \$117,251,169. This made the total expenses of the state school systems \$1,937,995,105. Of this amount \$305,314,829 was secured from loans and bond issues.

The cost of education per pupil attending school varied from \$25.30 in Mississippi to \$170.94 in Nevada. The average for all of the states was \$95.16. In 1900 the expenditure per pupil in average attendance was \$20.21, in 1910 it was \$33.23 while in 1920 it was \$64.15. In 1923-24 the average total expenditure per day for each pupil attending was 56.6 cents.

**PRIVATE, COMMERCIAL AND BUSINESS SCHOOLS.** The United States Bureau of Education published the following statistics for private, commercial and business schools for the school year 1924-25: The number of private schools had decreased since 1920. In that year 903 institutions reported to the Bureau an enrollment of 336,032 students. For 1924-25 only 739 schools reported, and these had an enrollment of 188,363 students. The reduction in the number of day students was about 40 per cent, and in night students 51 per cent. The stenographic course with an enrollment of 71,173 students is the largest. Next comes the bookkeeping course with 41,717 students. The secretarial course with 23,832 students showed the only increase in enrollment.

There were 20 public commercial and business high schools enrolling 35,120 students. In addition there was in 1924 a total of 3742 public high schools in which 430,975 students were enrolled in commercial courses and 740 private high schools enrolling 11,941 students.

**EDUCATIONAL COSTS.** The increasing costs of public education was causing much concern among the school administrators of the country. In various cities there had been pronounced efforts to economize. In some cities there had been a change in the organization of the high schools so as to reduce the number of small classes and to increase the number of students per teacher. In the country as a whole, however, the number of high school students had decreased since 1900. In that year there was an average of 25 students per teacher. Now the average is 22.1 pupils.

There was a widespread belief that economies must be introduced into the administration of high schools. Often one heard the suggestion that tuition might be charged for secondary education. This plan had not been proposed for adoption in any city or state, but it will not be surprising if this should become a real issue in near future.

There was an insistent demand that the schools assume added responsibilities. No matter how desirable these newer ventures in education may be, they always tend to increase the expense of

the school system. Kindergartens were increasing, and there was a strong emphasis upon the care of younger children in pre-kindergarten or nursery schools. During several years many school systems spent considerable amounts in the revision of the courses of study. Some of the cities made permanent provision for bureaus of curriculum revision.

The consolidation of rural schools had been under way for a number of years. In 1923-24 the United States Bureau of Education reported a total of 14,134 consolidated schools, while there were still 157,034 one-room school buildings. During the period of unusual prosperity some sections constructed consolidated school buildings that cost very large amounts. Usually the money for these new buildings was obtained by bond issues. Now with the decline in agriculture some of the consolidated districts find themselves with serious financial problems.

Early in 1926 a National Commission on Economy and Efficiency of the Business Administration of School Systems was appointed by the joint action of Secretary of Commerce Hoover, Secretary of the Interior Work, and Dr. Frank W. Ballou, at the time president of the Department of Superintendence of the National Education Association. The purpose of the commission is contained in the following statement:

It is the unanimous opinion of the members of the commission that, although the American people have faith in the public schools, the cost has become so great that approval of continued rapid expansion along present lines is by no means unanimous. There is an insistent demand for the adoption of the fundamental principles of good business management in the administration of all school systems. It is felt that while the taxpayers are ready and willing to meet the present annual bills they will only agree to any considerable increase in those bills if they can be assured that the money is being expended wisely and that the product is the best that money can buy.

For these reasons the first questions which will be dealt with by the commission will have to do with a comparison of present-day methods of school administration with the practices in vogue in large industrial and commercial establishments. By such comparisons the commission hopes to point out economies which might be effected without any depreciation of the quality of the education given. Such economies would result in making additional funds available for the expansion of the school plant without adding to the present burden of the taxpayers.

The annual cost of public education has nearly doubled during the past five years and is almost four times as great as it was in 1915. Some of this unusual increase can, of course, be explained by the loss in the value of the dollar and by the rapid growth in school attendance, but by no means all of it. Some of it has certainly been due to a growing insistence on the part of the public for more and better schools, modern equipment, greater play facilities, increased extra-curricula activities, better pay for teachers in order to obtain better teachers, an expansion of health conservation facilities such as dental and medical clinics, and a host of other demands indicating a very positive belief in the public school as an institution which is essential to the welfare and progress of the nation.

**STATE EDUCATIONAL SYSTEMS RANKED.** Dr. Frank M. Phillips using an index number method has ranked the State education systems as reported in *The United States Daily*. Dr. Phillips took into consideration the following items:

Percentage of school population from 5 to 17 years of age, inclusive, in daily attendance; average days attended by each child 5 to 17 years of age, inclusive; average number of days on which schools were in session; percentage of the total enrollment in high schools; ratio of boys and girls in high schools; average expenditure per teacher employed; expenditure per child attending the schools; average expenditure per teacher employed; expenditure per pupil for purposes other than teachers' salaries, and expenditures per teacher for salaries.

The ranking of the States educationally on the foregoing basis was as follows: 1, California; 2, Nevada; 3, New York; 4, New Jersey; 5, Ohio; 6, Michigan; 7, Colorado; 8, Wyoming; 9, Massachusetts; 10, Washington; 11, Minnesota; 12, Arizona; 13, District of Columbia; 14, Connecticut; 15, Oregon; 16, Illinois; 17, Indiana; 18, Wisconsin; 19, Pennsylvania; 20, South Dakota; 21, Rhode Island; 22, Kansas; 23, Iowa; 24, Utah; 25, Nebraska; 26, North Dakota; 27, Maryland; 28, Delaware; 29, Idaho; 30, Montana; 31, New Hampshire; 32, Maine; 33, Missouri; 34, Vermont; 35, Oklahoma; 36, West Virginia; 37, New Mexico; 38, Florida; 39, Texas; 40, Louisiana; 41, North Carolina; 42, Virginia; 43, Kentucky; 44, Tennessee; 45, Georgia; 46, Alabama; 47, Mississippi; 48, South Carolina; 49, Arkansas.

**TEACHER SUPPLY.** There were evidences in 1926 that the supply of teachers was rapidly exceeding the demand. In some States only about one-half of the graduates from the normal schools and teachers colleges in June found employment as teachers. The same conditions existed in some of the city training schools. As reported by the United States Bureau of Education there were in 1923-24 a total of 748,309 teaching positions in the State school systems. During the same year 418,533 were preparing to teach. Of these 253,747 were enrolled in the regular sessions and 191,311 were in summer sessions. It was estimated that the various institutions turned out no less than 107,488 prospective teachers. It is evident therefore that during that year there was a possibility of replacing one teacher in every seven in the public schools by a recent graduate from the teacher training institutions.

In addition to those who were available from the teacher training schools it was reported that many of those who left teaching to take up business or commercial positions were returning. The initial salaries that are paid to teachers are such as to attract to teaching many who do not expect to continue teaching. In New York City there is a group of young men teaching in the elementary schools. Few if any of these intend to remain as teachers. They are using the salaries that they receive from teaching to prepare themselves for positions in the professions.

Of the 382 teacher institutions that were reported, 88 were teachers' colleges. These colleges have attracted many students who have no desire to teach but take this method of obtaining a college education. In some States it is evident that the introduction of teachers' colleges has been closely equivalent to establishing institutions that parallel the purposes of the State university.

One effect of the surplus of teachers is the attempt on the part of various institutions to raise admission requirements and to raise the standards of the institutions itself.

Another effect has been the efforts on the part of a number of cities and villages to decrease the salaries of teachers. Few of these attempts have been successful. The salaries of teachers are so controlled by State laws that it is difficult to decrease them, but it is a question as to whether the increasing surplus of teachers will not force a decrease in salaries.

Some States are making vigorous efforts to raise the requirements for certification to teach. Usually the rights of those who have been certificated are such that only those who enter teaching have been greatly affected by such changes.

**RELIGIOUS INSTRUCTION.** The right of city boards of education to dismiss school children for periods of religious instruction outside of

the school was before the New York State courts. The practice of excusing children from the public schools to attend religious instruction in the churches or institutions selected by their parents was found in more than 125 cities and villages in the State. Early in 1926, the president of the Freethinkers' Society sought a writ of mandamus to compel the Commissioner of Education to require the Board of Education of White Plains to discontinue their practice of permitting public school children to attend religious instruction for one hour a week during school hours in the various churches and places provided for such instruction. The Justice in the Supreme Court in which the case was argued decided in favor of the defendants. He stated the following propositions:

That the right of the parent to direct the training and nurture of the child is a fundamental right;

That the obligations of citizenship require the promotion of a spirit of patriotic and civic service and the fostering in children of moral as well as intellectual qualities;

That the religious conscience, conviction, and accountability are the least dispensable foundations for good citizenship and real patriotism;

That the moral growth and intellectual growth go hand in hand to make the essential elements of character and good citizenship;

That the right of the State to enforce school attendance does not mean that the mental and moral development of all children must be standardized;

That the regulation (the Board's ruling dismissing the children for religious instruction) does not require a union between church and state or teach any sectarianism in the school or invade the religious freedom or conscience of any individual.

The case was carried to the Appellate Division of the Supreme Court. The counsel in behalf of the appeal attacked the constitutionality of the State statute under which the Commissioner of Education had ruled that the Board of Education of White Plains might excuse pupils for religious instruction outside of the school. It was declared that this was in conflict with the compulsory education law which the Commissioner of Education was required to enforce. The law was also attacked as subversive of the fundamental constitutional provision for divorce of church and state.

Counsel for the State department argued that "to refuse to permit children to absent themselves from their regular school work for religious instruction would be an interference with the constitutional guaranty of freedom of worship and religious liberty."

The appeal was dismissed, but it was announced that the case would be carried to higher courts.

**EDUCATIONAL MOTION PICTURES.** The Eastman Kodak Company was conducting a teaching experiment with classroom films, in ten cities. The purpose of the experiment was set forth in a following quotation from a letter written by George Eastman, president of the Eastman Kodak Company to Will H. Hays, president of the Motion Picture Producers and Distributors:

For the last three years the Eastman Kodak Company has been making a survey of the use of motion pictures in teaching as a supplement to text-books to find out what has been done and what promise there was of future sound development. Such films were not practicable until an easily operated projector and economical films were available to schools.

The survey led us to the conclusion that very little had been accomplished in producing teaching films suitable for classroom use and that there was little prospect of any organization with the necessary resources attempting to solve the problem. Therefore, after full con-

sideration, the company has decided to approach the solution of this problem in an experimental way.

It proposes to make a number of teaching films closely correlated with selected courses and in accordance with a definite educational plan. These films will be prepared with the advice and assistance of competent educators and will be put into a limited number of representative schools in different cities for trial in their classrooms. As the work of production goes on, the company will thus have definite information as to whether the right sort of films are being made.

In making this announcement the company wants it to be clearly understood that it will have no apparatus or films for sale to schools during this experimental period, which will take about two years. Any future developments will be determined by the success of these experiments. The company leaves itself free to discontinue this undertaking if at any time it feels that there are insurmountable obstacles to its success.

The Kodak Company was producing films for the study of geography, health and hygiene, civics, fine and practical arts and general science in the fourth, fifth, and sixth grades and the junior high schools.

The cities in which the experiment is being tried are Rochester, Detroit, Chicago, Kansas City, Denver, Los Angeles, New York, Springfield, Mass., Atlanta, and Winston-Salem, N. C.

**THE PAN-PACIFIC EDUCATION CONFERENCE.** In the early part of 1926, Congress authorized and requested the president to call a Pan-Pacific Conference on Education, Rehabilitation, Reclamation and Recreation. The act provided that the conference shall be organized and conducted by the Secretary of the Interior. The conference will be held in Honolulu, Hawaii, April 11 to 16, 1927. The members of the conference will discuss the mutual problems relating to education, reclamation, rehabilitation and recreation. The Secretary of State has issued invitations to the nations bordering on the Pacific Ocean or having territorial interests in the Pacific.

**WORLD FEDERATION OF EDUCATION ASSOCIATIONS.** The second biennial conference of the World Federation of Education Associations was announced to be held in Toronto, Canada, Aug. 7-12, 1927. The first meeting of the Association was held in Edinburgh, Scotland. At that meeting various committees were appointed and these were to report at the Toronto meeting. Among these were to be reports on International Athletics; Military Training; Text-Books; Co-operation for Peace, and Peaceful Means Used to Settle International Difficulties. The tentative programme included a wide range of educational topics and many well-known men and women were to speak. Plans had been made to care for about 5000 delegates and others.

**ADULT EDUCATION.** During recent years there has been much discussion regarding adult education. In many cases attention has been centred upon the teaching of illiterates, although there are various clubs and classes that meet the needs of particular groups. The Carnegie Corporation conducted an extensive survey of existing adult education enterprises, and secured the judgments of those who were interested in the work. In response to the needs that were indicated by the survey the American Association for Adult Education (q.v.) with offices at 41 East 42nd Street, New York City, was organized. A statement issued by the Association contains the following:

The studies which preceded the organization of the association revealed an active and widespread interest in adult education. Though often unconscious that they were pioneers in a new movement across intellectual frontiers, adults were pursuing education. There has

been adult education in the country without an association and before one was thought of. Perhaps its highest value lay in that it had arisen on impulses generated from within rather than stimulated from without. In small spontaneously formed study groups, in workers' classes, in institutes and forums or university extension classes, throughout the country, men and women were occupied in studying in their leisure hours.

Early in 1926 a series of conferences was held in New York, San Francisco, Chicago, Nashville and Cleveland to consider what deductions might be made from these facts. To the conferences came, not those with interests at large or those interested habitually in new movements, but men and women professionally engaged in adult education. They expressed the belief that an organization, which sought not to centralize, standardize or impose uniformity, but to serve as a clearing house of information and ideas, a centre of discussion and a repository of the records and practices of the profession, would further the idea of adult education and give assistance to adult educators and students.

An organization was formed and its offices are now open, with Morse A. Cartwright as executive director and an executive board which reflects the differences in point of view and practice to be found in the field. It is to be the association's policy to proceed slowly and to make progress enduringly rather than swiftly. Its first object will be to establish relations with those engaged in adult education, whether as teachers or students; groups, schools and individuals are eligible to membership. Preliminary to opening the association's offices, Mr. Cartwright attended a conference of the World Association for Adult Education in Copenhagen last August and put himself in touch with adult educators in European countries, where there is a much larger body of experience than here.

The association plans no campaigns, no drives. It will seek to put on record the efforts at adult education already begun, and stand ready to give them what assistance it can. Similarly it will stand ready to give advice and assistance to those which are in prospect or contemplation. It will publish pertinent material at intervals and convene conferences when subjects vital enough press for discussion. Most of all, it will seek to accumulate a body of material bearing on the problems of adult education to which all those facing such problems may resort.

The association in coöperation with the New School for Social Research in New York City opened courses dealing with the Fundamental Problems in Adult Education, Method and Content of Adult Education, Practice Course and Educational Psychology.

**EGYPT.** A kingdom in northeastern Africa, governed by a King since Mar. 15, 1922, after the termination of the British protectorate declared Dec. 18, 1914; occupying the valley of the Nile, the Libyan desert, the region between the Nile and the Red Sea and the Sinai peninsula; claiming jurisdiction also over the Sudan, which claim, however, is denied by the British. Capital, Cairo.

**AREA AND POPULATION.** The total area of Egypt proper which is described above is about 383,000 square miles. This figure does not include the Sudan. The cultivated and settled area, comprising the Nile valley and delta, is only 12,023 square miles. The last census of the settled area, taken in March, 1917, gave the total population at 12,750,918; estimated in March, 1925, at 14,055,000. The chief cities with their populations at the census of 1917 are: Cairo, 790,939; Alexandria, 444,617; Port Said (including Ismailia), 91,090; Suez, 30,996; Tanta, 74,195; Mansura, 49,238; Asyut, 51,431; Damanhur, 47,867; Fayum, 44,000. In the same year the population was distributed among the various religions as follows: Mohammedans, 11,058,148; Greek Orthodox, 854,778; Roman Catholic, 107,687; Jews, 59,581; Protestants, 47,481. The movement of population in 1924 was: Births, 604,410; deaths, 343,515.

**EDUCATION.** Primary instruction is supplied by native schools called *Maktabs*. In 1924-25 the number of these receiving grants-in-aid and

under government inspection was 2801, with 5632 teachers and 218,428 pupils, while those under the immediate direction of the government in 1925 was 407 with 33,378 boys and 19,640 girls in attendance. In addition there are higher elementary and higher primary schools, a few schools for special and technical training, and higher colleges of law, engineering, military science, veterinary science, agriculture, pedagogy, commerce and accounting, medicine, and agriculture. The total number of schools under the control of the provincial councils in January, 1925, was 3461, with 285,112 pupils, while those directly under the ministry of education had an attendance of 82,842. The centre of Moslem culture is the mosque and university of El-Azhar at Cairo.

**PRODUCTION.** The number of landowners in Egypt has steadily increased during the last decade, and a decreasing percentage of this number are foreigners; the 1925 total was 2,040,000, of whom less than 7000 were non-Egyptians. Efforts have been made to compel farmers to introduce the three-year crop rotation system, but the difficulties of enforcement are such that it will be cropped with cotton at least every second year. New enactments expected to have far-reaching effects on agricultural conditions were the prohibition of the mixing of different varieties of seed and the appropriation of £E4,000,000 to inaugurate the agricultural financing scheme by which four-per cent loans will be made to small farmers. After the opening of the Sennar Dam in January, 1926, there was considerable discussion as to whether extension of irrigation in the Sudan will effect Egypt's water supply, but as the appropriations for furthering this construction have been partly canceled for 1926, the problem is not a pressing one.

The cultivable area of Egypt was estimated at 8,070,186 feddans (1 feddan equals 1.038 acres) in 1924, and of this 2,936,698 were uncultivated because of want of reclamation. The cotton area and crop for 1924-25 was 1,787,843 feddans and 7,273,974 kantars. See *COTTON*. Other important crops with figures for 1924 are: Wheat, 1,415,883 acres and 930,387 tons; barley, 372,206 acres and 234,144 tons; beans, 452,424 acres and 267,003 tons; lentils, 75,961 acres and 47,498 tons; onions, 40,770 acres and 261,079 tons; maize, 1,877,662 acres; millet, 238,901 acres; rice, 254,923 acres; sugar cane, 53,463 acres. Also see Table of Production by Countries under article *AGRICULTURAL*. The principal mineral products in 1924 in metric tons were phosphate rock, 87,869; petroleum, 163,341; and manganese iron ore, 150,194. Other products are building stone, clay, carbonate and sulphate of soda, gypsum, nitrate, shale, salt, talc, turquoise, ochres, etc. Manufacturing in Egypt is still in its infancy, but indications point to systematic and more rapid development during the next decade. Although the cigarette industry is one of the most important in the country, no tobacco is raised in Egypt, but \$7,000,000 worth is imported annually.

**COMMERCE.** According to the United States Bureau of Foreign and Domestic Commerce, in 1925, for the fourth consecutive year, Egypt's trade showed an export surplus, although, because of the slow export movement of the 1925-26 cotton crop and a very marked advance in commodity imports the amount of this favorable

balance was only a small fraction of the average of the three preceding years (£E13,025,698). During the first six months of 1926, however, not only did exports and reexports continue to decrease, totaling £E23,189,000 as compared with £E31,746,000 in the first half of 1925, but imports also dropped off slightly, totaling £E24,744,000 as compared with £E26,487,000 in the first half of 1925. This fall, caused almost wholly by continued lower cotton prices, has at last converted the four-year export surplus into an import surplus, amounting to about £E1,500,000 in the first six months of 1926 and to nearly £E4,000,000 in the first seven months of the year. In spite of this fact, business conditions continued firm. The accompanying table from the above mentioned source shows the exports and imports for the year 1925 and the first half of 1926:

VALUE OF EGYPT'S FOREIGN TRADE  
(In thousand Egyptian pounds \*)

	1925	1926 (January-June)
<b>Imports</b>		
Yarns and textiles . . . . .	17,966	6,464
Metals and metal ware . . . . .	8,472	4,367
Cereals, flour, and agricultural produce . . . . .	7,101	3,180
Wood and coal . . . . .	4,840	1,850

Surplus . . . . .	2,244	1,575
Equivalent in dollars . . . . .	11,108	7,848

\* Exchange rates, used for conversion of totals, are: 1925, \$4.95; 1926 (first six months), \$4.98.

<sup>b</sup> Including raw-cotton exports, amounting in 1925, to 6,423,939 kantars (288,630 metric tons), valued at £E51,659,806 in 1926 (first six months), to 8,357,934 kantars (150,870 metric tons), valued at £E18,385,488.

**FINANCE.** The budget estimates for 1925-26 were: Revenue £E30,870,000; expenditure, £E30,288,266. The estimated surplus of £E581,734 was expected to be considerably exceeded by the actual receipts. Customs receipts for the year amounted to £E12,342,000. It is noteworthy that while most governments were heavily burdened by debts, Egypt enjoyed an enviable position. The total debt, as of Mar. 31, 1926, was only £E91,976,000 (\$458,040,000), and 57 per cent of

this total was held in the country as compared with 14 per cent in 1919. Moreover, it is largely counterbalanced by the rapidly growing government reserve fund, which amounted on the above date to \$127,786,000, as compared with \$89,172,000 at the beginning of the fiscal year, 1925-26. The exchange value of the Egyptian pound continued to rise, averaging \$4.95 in 1925 and \$4.98 in the first eight months of 1926.

**COMMUNICATIONS.** Steamships, exclusive of warships, etc., entering the ports of Egypt in 1924, numbered 8037 of a net tonnage of 25,735,955 and 8058 steamers of 25,794,724 net tons cleared. The figures for steamships include the transit of the Suez Canal (q.v.). Sailing vessels entered numbered 2306 of 136,847 net tons; cleared, 2199 of 127,240 net tons. On Mar. 31, 1925, there were (exclusive of sidings) 2272 miles of rails belonging to and operated by the state, and 852 miles operated by private companies. The greater part of the private and approximately one-half of the state railways are in the delta region.

**GOVERNMENT.** According to the constitution proclaimed Apr. 20, 1923, Egypt was declared a sovereign state under a hereditary monarchy, with a representative government. Equal rights, irrespective of race, language, or religion, were guaranteed, as was the liberty of the individual and religious belief. Executive power was vested in the king, who also exercises legislative power in concurrence with the legislature. The latter was to consist of a senate and a chamber of deputies, the senate to be composed of three-fifths elected by universal suffrage and two-fifths appointed by the king (the term of office is ten years; one-half is renewed every five years); and the chamber of deputies to consist of members elected by universal suffrage for five years. The king can dissolve the chamber of deputies to which the ministers are jointly and separately responsible. Mohammedanism is the state religion and Arabic the official language. The king in 1926 was Fuad I, who acceded Mar. 15, 1922. The cabinet as reconstructed in September, 1925, was made up as follows: Prime Minister and Minister of Foreign Affairs, Ahmed Ziwari; Interior, Helmi Issa; Finance, Yehia Ibrahim; War, Moussa Fouad; Education, Ali Maher; Communications, Mohammed Tewfik Rifaat; Public Works, Ismail Sirri; Agriculture, Nakhla el-Motéi; Wakfs, Mohammed Tewfik Rifaat.

## HISTORY

**SITUATION AT THE BEGINNING OF THE YEAR.** The year opened with the struggle between Ziwari Pasha, the pro-British prime minister, and Zaghlul Pasha, his bitter opponent, unabated. The prime minister announced on January 12 that he intended to hold the elections for a new parliament as soon as possible and that direct voting would prevail. He stated that if possible the elections would be held in April and a meeting of the legislature would assemble in the following month. The opposition parties held a meeting on February 19 in the face of government prohibition and bitterly attacked the Ziwari government, stating that it was unconstitutional and also debating the question as to whether the opposition parties should participate in the forthcoming election or wait until King Fuad had appointed another cabinet. This procedure was finally rejected and the three

opposition parties determined to unite on a single candidate in each district so as to present as much strength against the government as possible.

Early in the year John D. Rockefeller, Jr., presented a plan through Prof. James H. Breasted, by which he would donate to Egypt the sum of \$10,000,000 for the erection of a suitable building at Cairo to house the tremendous mass of archaeological exhibits which had been unearthed in Egypt in recent years. The proposition was submitted to legal advisers by the government and considerable comment both pro and con ensued in the press. Many Egyptian nationalists took the stand that the offer should be rejected on the grounds that it more or less smacked of charity on the part of the oil king. The chief objection on the part of the government was the fact that one of the principal conditions of the gift was the fact that the administration of the work under the gift should be in the hands of a committee for 33 years, which committee should consist of eight members, two each from the United States, Great Britain, France, and Egypt. So much opposition to the plan developed that Mr. Rockefeller finally withdrew his offer on April 27.

**THE ELECTIONS.** The long-awaited for elections were finally held on May 22, and, as had been confidently expected by the opposition parties, resulted in a complete defeat for the forces of Ziwar Pasha. Zaghlul almost immediately thereafter announced his intention of forming a cabinet of his own, but was finally dissuaded and stepped aside in favor of his ally, Adly Pasha. It was only by this means that the opposition was able to hold the fruits of its victory, because it was common gossip that Great Britain, acting through her representative in Egypt, Lord Lloyd, would never permit a Zaghlul ministry. Needless to say, this called forth a large amount of comment in the press the world over as to whether Egypt was a sovereign state or whether she was still a puppet and pawn of Great Britain. The cabinet as ultimately formed on June 6, consisted of the following members: Premier and Minister of the Interior, Adly Pasha; Foreign Affairs, Abd-el Khalek Sarvat Pasha; Finance, Morcos Hanna Pasha; Justice, Zake Pasha Abd-el Seoud; War, Kamel Bey Khasaba; Communications, Mohammed Pasha Mahmoud, Pious Foundations, Neguib Pasha Gharabali; Agriculture, Fathalla Barakat Pasha; Public Works, Osman Moharam Pasha.

**PARLIAMENT.** For the first time in more than a year and a half a regularly elected parliament of Egypt assembled on June 10. All the attending pomp and ceremony were carried out in the presence of King Fuad and the British representative, Lord Lloyd. Premier Adly Pasha, in his opening address stated that it would be his policy to strengthen parliamentary government and a respect for the constitution. With regard to relations with Great Britain he said "The Government particularly concerns to establish between the British and Egyptian nations and their governments mutual confidence and cordial relations, and to prepare an atmosphere of good understanding which will permit Egypt to enjoy complete independence. The Government considers that the measures taken in the Sudan cannot impair Egypt's legitimate claims, which remain what they were, and will

do all that is possible to reach in this connection a solution giving Egypt satisfaction." Zaghlul Pasha was elected president of the legislative body and declared that while he and his party would support the Adly government as a national union of parties, he would reserve the right to criticize it if he considered it fell short of its duties.

For the time being the question of the acts of the Ziwar ministry were not brought up for discussion and the country enjoyed a period of comparative political quiet which had been unknown for some time. In early August a complete survey was made of the decree laws issued by the Ziwar government and some of them were validated and the rest declared void because of the unconstitutional aspects of his ministry. The parliament spent weeks in discussing the financial situation and decided to discontinue several legations and consular offices abroad in the interest of economy. The whole question of state salaries was gone into and several changes, mostly of a downward nature, were made. The King's civil list was approved after a bitter debate during which a resolution was passed stating that "His Majesty should cause reductions to be made, so that the administration of the royal revenues may be an example of economy and good management to the country as a whole." As a result of the discussions of the budget a reduction of about \$5,000,000 was effected, although even allowing for that a deficit of more than twice that sum was expected.

The fall term of parliament opened its session on November 18. Premier Adly in his speech stressed the necessity of financially aiding the cotton grower, as well as restricting the area planted to secure price control and the formation of cooperative associations to help the agricultural producers. Plans were also suggested for bettering the control of the waters of the Nile, upon which Egypt must depend almost entirely for the fertility of her soil. He stated that the foreign relations of the country were in a most satisfactory condition and that Great Britain and Egypt were understanding each other better than ever before. Zaghlul was again elected president of the chamber by a unanimous vote. On December 8, the government passed a law limiting the acreage sown to cotton to about one-third of its 1920 area. The law was to be in effect for three years. See **ARCHAEOLOGY**.

**EINSTEIN THEORY.** See **ASTRONOMY**; **PHYSICS**; **RELATIVITY**.

**ELECTRICAL ENGINEERS, AMERICAN INSTITUTE OF.** A national organization representing the electrical engineering profession, founded in 1884. The objects of the Institute are the advancement of the theory and practice of electrical engineering and of the allied arts and sciences, the maintenance of a high professional standing among its members, and the development of the individual engineer. It is governed by a board of directors, elected by the membership, consisting of a president, the two junior past presidents, 10 vice-presidents, 12 managers, and a treasurer. There are 51 sections of the Institute located in various cities throughout the country and 89 branches in colleges giving courses in electrical engineering. Three annual conventions are held, in addition to regional meetings and local section and branch meetings. Much of the Institute's work is accomplished

through its standing and technical committees, of which there are 33. It maintains, in coöperation with other national engineering societies, the Engineering Societies Library and a national employment service. There are three grades of members, as follows: Associate, member, and fellow; and the total membership on Oct. 1, 1926, was 18,351. The principal publications of the Institute are the monthly *Journal*, the annual *Transactions*, the *Standards of the A. I. E. E.*, and the *Year Book*. The officers for 1926-27 were: President, C. C. Chesney; junior past presidents, Farley Osgood, M. I. Pupin; vice-presidents, A. E. Bettis, W. P. Dobson, P. M. Downing, H. M. Hobart, B. G. Jamieson, G. L. Knight, W. E. Mitchell, A. G. Pierce, H. S. Sands, H. H. Schooffield; managers, J. M. Bryant, H. P. Charlesworth, F. J. Chesterman, H. C. Don Carlos, M. M. Fowler, H. A. Kidder, W. M. McConahey, E. B. Merriam, I. E. Moulthrop, E. C. Stone, W. K. Vanderpoel, J. B. Whitehead; national treasurer, George A. Hamilton; secretary, F. L. Hutchinson. The national headquarters are in the Engineering Societies Building, 33 West 39th Street, New York, of which it is joint owner with three other national societies.

**ELECTRICAL INDUSTRIES.** The year 1926 was notable for great increases of output by electric light and power companies as well as in the number of customers served. At the beginning of 1926, the capacity of generating plants in the United States was estimated to be 26,200,000 kva., and this was greatly increased during the year. The activity in all lines of industry during the year, especially building construction, produced increased demands for electricity and the construction of lines through which to supply it. The constantly widening use of various domestic appliances, particularly electric refrigerators, for the introduction of which an active sales campaign was inaugurated was responsible for much of the new demand. Electric energy displaced steam power at an increasingly rapid rate. An interesting survey by *Electrical World* showed that more than 44 per cent of all the electric motors installed were located in the three States of Pennsylvania, Ohio and New York. In Pennsylvania there were 3,457,471 hp. of motors, Ohio was second on the list with 2,291,179 hp. installed and in New York the total was 2,208,621.

By industries, this investigation also disclosed the proportion of electric motor horsepower in use in the principal industries as given in the following table:

	Per cent
Iron and steel . . . . .	21
Machinery . . . . .	11
Textiles . . . . .	11
Food . . . . .	10
Chemicals . . . . .	8
Transportation . . . . .	7
Paper and printing . . . . .	7
Stone, clay, and glass . . . . .	6
Miscellaneous . . . . .	19

Electric light and power companies, electric street railways, electrical manufacturing and the telephone business enjoyed an enormous gross revenue during the year, amounting to \$5,934,000,000. The invested capital of these companies was reported to be \$19,500,000,000—to which

they added, during the year \$1,570,000,000.—The total investment in the electric light and power industry was estimated by *Electrical World* to be \$8,400,000,000, and at the close of the year these undertakings were serving a total of 19,528,581 customers of which number 1,460,360 were added during the year. At that time, also it was planned to expend \$397,000,000 for generating stations and \$561,000,000 for transmission lines and distribution facilities.

**ELECTRIC LIGHTING.** One of the outstanding features of the year was the increased efforts on the part of municipalities and automobile clubs to improve traffic light signal systems. In many of the larger and in not a few of the smaller cities, the practice of using three colors for traffic signals was adopted. In some localities, it was found more satisfactory to employ only red and green, for indicating "stop" and "go," respectively; while in others, the use of yellow for caution conferred an added degree of safety both for pedestrians and drivers of motor cars. In Chicago, Cincinnati, to a limited extent in New York and in a few other cities, traffic signals were satisfactorily controlled from a single station by automatic timing devices which could be so set as to give any desired time interval for the movement of vehicles on main thoroughfares or for dangerous street intersections.

In some localities, where fatal accidents to pedestrians had been especially frequent, great improvement was brought about by substituting more and brighter lamps for street illumination. Illuminating engineers were in many places engaged in a study of this problem which was to some extent complicated by the presence of shop window illumination, flashing signs, etc. In one city it was found necessary to install on a busy avenue lighting units of 2500 candle power (25,000 lumens by new rating) set on 18-foot poles 100 feet apart. There was considerable improvement in the lighting of highways, the tendency being in the direction of brighter lights, but the use and adjustment of automobile headlights, as regards avoidance of glare, was still far from satisfactory. The Society of Automotive Engineers and the Illuminating Engineering Society appointed a joint committee for the investigation of automobile headlighting with a view to its improvement.

The increasing extension of airplane mail routes, involving night flying, brought many new problems to the attention of engineers and involved the erection of specially designed beacons for the guidance of aviators.

**ELECTRIC SIGNS.** An interesting aspect of outdoor illumination was furnished by the report of an electric sign survey in the City of New York, which disclosed the fact that the illuminated signs along the city's "Great White Way" were estimated at 25,000,000 cp. by Arthur Williams, vice-president for commercial relations of the New York Edison Co. Of the 17,000 electric signs below 135th Street, restaurants showed more than 2800; 1300 were on barber shops; 1100 advertised tobacco, 867 clothing, and 763 called attention to the display of automobiles and their accessories. It was also reported that during 1925 almost 5000 new electric signs had been added to the nightly display.

The lighting of factory interiors was char-

acterized by brighter and better diffused illumination in order to bring about better working conditions with diminished eye strain and as a result secure a greater output.

**ELECTRIC POWER TRANSMISSION.** An analysis made by *Electrical World* showed that in 1925, of the smaller companies (generator rating of less than 500 kva), 2091 were generating all their energy, and in 1924 there were 2321 such companies. At the end of 1926, there were even fewer. The smaller central stations, by means of interconnection with stations of the large systems, were abandoning their generating equipment and purchasing energy from the larger companies, thus becoming distributors only, of energy. The same authority also stated that during the year 1926, 1738 companies had no generating or power-house equipment and no high-tension transmission lines.

There were 114 systems with generator or transformer ratings of more than 50,000 kva. Of these, 91 generated all their own energy, 21 generated and also purchased energy from other systems and only 2 purchased all their energy. The combined rating of these companies was 19,352,002 kva., or 69.3 per cent of the total rating of all systems in the United States.

As in 1925, many instances of interconnections between transmission lines were evidence of the large-scale development work that was being prosecuted. In California, a 105-mile line was built to connect two large power systems whose hydroelectric generating plants were situated 450 miles apart. This tie line was said to have cost more than \$2,000,000. Another California undertaking was a 220-kv. line under construction for the purpose of transmitting energy from the Big Creek plants to the Los Angeles district. It was 223 miles long and was estimated to cost \$11,000,000, including the construction of 75 miles of road for transporting tower and line material through a hitherto inaccessible and untraveled part of the mountains.

Near Allentown, Pa., the Pennsylvania Power & Light Co. completed, during the year, a 220-kv. transmission line 65 miles long; the first line built in the East for so high a voltage. Special features were embodied in the design of the insulators, conductors and steel towers for the purpose of insuring uninterrupted service as the line passed over the mountains in a district where sleet storms were of frequent occurrence. It was expected that satisfactory operation of this undertaking would to a large extent influence the design of other high-tension circuits that were under consideration in the East.

As in 1925, higher voltages on both underground and submarine cables characterized the year's developments. In Chicago, two 66,000-volt cables were put in service, one connecting Crawford Avenue generating station with Northwest station 10 miles distant; the other connecting the former with Fisk Street station. Between St. Louis, Mo., and East St. Louis, three submarine cables, each of 33,000 kw. capacity, were laid under the Mississippi. A novel feature of this work was the manufacture of the cables in 2,500-ft. lengths in order to obviate the necessity of splicing in mid-stream. A 15,000-volt cable was laid across Puget Sound, where the water was 840 ft. deep. This cable was insulated with rubber instead of impregnated paper, and

its installation was considered especially notable on account of the weight to be handled (15¼ lb. per foot of length) and the great depth of water. See POWER; WATER POWER.

**ELIOT, CHARLES WILLIAM.** American educator and president emeritus of Harvard University, died at Northeast Harbor, Me., August 22. He was born in Boston, Mass., Mar. 20, 1834, and, preparing for college at the Boston Latin School, graduated from Harvard in 1853. In 1854 he became tutor in mathematics, and a student in chemistry with Professor Josiah P. Cooke. In 1858 he was made assistant professor of mathematics and chemistry in the Lawrence Scientific School, serving in that capacity until 1863, when he visited Europe studying chemistry and investigating modern educational methods. On his return in 1865 he became professor of analytical chemistry in the Massachusetts Institute of Technology, then recently founded in Boston. He visited France in 1867-68 and in 1869 was elected 22d president of Harvard College. Immediately he undertook a series of reforms and radically transformed the institution, the innovations adopted under his administration having a marked effect upon educational methods and systems in other American colleges. He remodeled the curriculum to secure a more liberal basis of studies, patterning the general scheme of instruction somewhat on the model of European universities. He introduced what was known as the elective system with the object of granting greater breadth and privilege than previously had been associated with the American college. Dr. Eliot effected the substitution of lecture courses for recitations and all-written tests for oral examinations.

In his first report he singled out the Harvard Medical School for special comment and remarked, "the whole system of medical education in this country needs thorough reformation." One of the results of his interest in this field was the development of the idea of full laboratory work, and a broad course of study in which were included all recognized subjects of medical instruction. In the Harvard Law School under President Eliot's administration, the case system was introduced into the teaching of law, and the level of the school rose to the place where the scientific teaching of law was carried on. There were few departments of the university in which the president's influence was not felt and, while his methods were the subject of controversies both at Harvard and in university circles generally, he was early recognized as an authority on higher education, and his annual reports were studied as important contributions to the solution of problems that concerned the development of higher education in the United States. Harvard University under Eliot's administration continued to increase in influence and reputation. From a college of 75 teachers and hardly more than 1000 students it grew into a university which, when he relinquished its active control in 1909, had more than 500 officers of instruction and more than 5000 students, with an income five times

as large as in 1869. The Graduate School, established as one of his first official acts, soon took rank with the leading universities of the world, while it was made possible to cover the undergraduate course in three years by a student passing into professional or post graduate work.

While at Harvard Dr. Eliot became widely known as a speaker and writer on various topics outside of educational matters, and he was fearless in his addresses, speaking his mind freely, and often bringing about widespread criticism. He made many public addresses on labor topics in which he criticised the labor union, believing that it shared with capitalism responsibility for the failure to develop a pure and efficient democracy. He became a member of the National Civic Federation and participated in many conferences with labor leaders and capitalists, enjoying the respect of both groups, though by many regarded as a bitter enemy of organized labor. Dr. Eliot also spoke and wrote on religious topics and stimulated thought and discussion by the frankness of his pronouncements on the religion of the future. Dr. Eliot resigned as president of Harvard in 1909 to become president emeritus, an honor he enjoyed at the time of his death. In March, 1909, President Taft offered him the post of ambassador to the Court of St. James's, a tender which received the unanimous approval of the American press and the public generally. Dr. Eliot declined this honor as he wished to be entirely free from official responsibility for the remainder of his life.

During the World War, however, he was active with voice and pen in behalf of the Allies, maintaining that "the hope of the world lies in complete coöperation between the British Empire and the United States of America, the two great sections of the English-speaking peoples." After the War he was a vigorous supporter of the League of Nations and defended the plan against the criticisms of its opponents. The latter years of Dr. Eliot's life found him in full possession of his intellectual powers, and from time to time he published essays in which he criticised various shortcomings of American civilization as he saw it. He called attention to such violations of the principle of majority rule as filibustering in the United States Senate, the resistance to the execution of the Volstead law by a minority of the total population, the prevalence of lynching, and the activities of the Ku Klux Klan. He also condemned the tendency to standardization in education and industry, and was outspoken for civic and intellectual betterment.

President Eliot's reputation was by no means restricted to his own university and the United States. He received from France the honor of Commandeur Légion d'Honneur; from Italy that of Grand Officer of the Crown of Italy in 1908; from Japan the Imperial Order of the Rising Sun of first class in 1909; from Germany the Royal Prussian Order of the Crown, first class, in 1909; from Belgium the Order of the Crown of Belgium, 1919; and from Serbia the Grand Cordon of the Order of St. Sava, 1923. He was a corresponding member of the Academy of Moral and Political Sciences of the Institut de France, and of the British Academy. In the United States he was awarded the first gold medal of the American Academy of Arts

and Letters as a recognition of "special distinction" in 1915, and was a fellow of the American Academy of Arts and Sciences, a member of the Massachusetts Historical Society, of the American Philosophical Society, honorary president of the National Conservation Association, president of the Massachusetts Society of Social Hygiene, 1915-20, a member of the General Education Board, 1908-17, of the Rockefeller Foundation, 1914-17, and of the International Health Board, 1913-17. From Harvard he received the honorary degrees of LL.D. and M.D. in 1909. He also received the degree of LL.D. from Williams and Princeton in 1869, Yale in 1870, Johns Hopkins in 1902, Tulane, University of Missouri and Dartmouth in 1909, Brown in 1914, Boston University in 1923, University of the State of New York in 1924, and Ph.D. from the University of Breslau in 1911. In 1923 he was presented with a medal for "distinguished service" by the National Council of Civic Reform. His writings include: *Manual of Qualitative Chemical Analysis* (with Prof. Francis H. Storer); *Manual of Inorganic Chemistry* (with same); *Five American Contributions to Civilization, and Other Essays*; *Educational Reform*; *Charles Eliot—Landscape Architect* (1902); *Annual Reports of the President of Harvard University* (1869-1909); *More Money for the Public Schools* (1903); *John Gilley* (1904); *The Happy Life* (new edition) (1905); *Four American Leaders* (1906); *The Durable Satisfaction of Life* (1910); *The Road Toward Peace* (1915); and *Late Harvest* (1924).

**EMERY, ALBERT HAMILTON.** American inventor and mechanical engineer, died at Stamford, Conn., on December 2. He was born at Mexico, N. Y., on June 21, 1834, and was educated at the Mexico Academy and at Rensselaer Polytechnic Institute, Troy, N. Y. His first notable invention was a testing machine which was in use for many years at the Watertown, Mass., arsenal. From this point he went on with his experiments in precise measurements of large quantities and among other machines of this nature of which he was the inventor are two installed at the Bureau of Standards in Washington. One of them has 230,000 pounds capacity for tension and compression, and the other has 150,000 pounds capacity for tension and 2,300,000 pounds for compression on specimens of all lengths up to 33 feet. He was also the inventor of the method of constructing guns by hydraulic radial expansion. He was active in experimental work and business until 1919, when he had reached the age of 85 years. One of his latest inventions was the plate fulcrum railway track scale which was employed on the Pennsylvania, Illinois Central, and several other railroad systems, as well as for master scales.

**EMMOTT, LORD.** British Liberal politician and manufacturer, died in London, England, December 13. He was born in 1858. After graduating from London University, he entered business. Apart from his interest in business, he displayed great aptitude for political life. From 1899 to 1911 he was a Liberal member of Parliament from Oldham, from 1906 to 1911 being Chairman of the Ways and Means Committee in the House of Commons. He was the head of one of the biggest cotton-spinning companies in England, and had served as First Commissioner of Works in the British Government. From 1911 to 1914 he was Under Secretary for the Colonies.

**EMPLOYER'S LIABILITY.** See WORKMEN'S COMPENSATION.

**ENDICOTT, MORDECAI THOMAS.** An American naval officer and civil engineer, died at Washington, D. C., March 6. He was born at May's Landing, N. J., Nov. 26, 1844, and graduated from the Rensselaer Polytechnic Institute in 1868 with the degree of C. E. After spending the intervening time in practice as a civil engineer and in mining, he was appointed civil engineer of the United States Navy, July 14, 1874, and was on duty at various navy yards and in the Navy Department at Washington as a consulting engineer. In 1895 he was appointed a member of the Nicaragua Canal Commission, and in 1897 a member of the United States Naval Armor Factory Board. In 1905 he was appointed a member of the Isthmian Canal Commission. In 1898 he was appointed chief of the Bureau of Yards and Docks of the Navy Department with the rank of commodore, and later advanced to the rank of rear-admiral. In 1902 he was reappointed and retired from active service Nov. 26, 1906, but continued upon active duties until June 30, 1909. During the World War he was recalled to active duty in the Navy Department. He was president of the American Society of Civil Engineers in 1911.

**ENDOWMENTS, COLLEGE.** See UNIVERSITIES AND COLLEGES.

**ENGINEERING.** See AQUEDUCTS; BOILERS; BRIDGES; CANALS; DAMS; DYNAMO-ELECTRIC MACHINERY; FIRE PROTECTION; GARBAGE AND REFUSE DISPOSAL; PORTS AND HARBORS; RADIO TELEGRAPHY AND TELEPHONY; TUNNELS; ETC.

**ENGINES, GAS OR OIL.** See INTERNAL COMBUSTION ENGINES.

**ENGINES, STEAM.** See STEAM ENGINES; STEAM TURBINES.

**ENGLAND.** The term in its strictest sense applies to the largest and most densely populated part of the island of Great Britain. As employed in reference to the government it often indicates the United Kingdom and Ireland. See GREAT BRITAIN.

**ENGLAND, CHURCH OF.** The established church of England. Its faith is represented in the United States by the Protestant Episcopal Church (q.v.). The King is the supreme governor of the Church, possessing the right to nominate to vacant archbishoprics and bishoprics.

The King and the First Lord of the Treasury also appoint to certain deaneries, prebendaries, and canonries, and the Lord Chancellor to certain canonries. For administrative purposes the country is divided into two provinces: the Convocation of Canterbury and the Convocation of York, each under the control of an archbishop. The Church Assembly, established in 1920 "to deliberate on all matters concerning the Church of England and to make provision in respect thereof," consists of three Houses, composed of Bishops, Clergy, and Laity respectively, the Laity being elected every five years by the lay members of the Diocesan Conferences, which consist of representatives elected by members of the Church. Every measure passed by the Church Assembly must be submitted to an Ecclesiastical Committee, consisting of 15 members of the House of Lords and 15 members of the House of Commons. This Committee reports on each measure to Parliament, and the measure becomes a law if it is passed by both

Houses of Parliament. Parochial affairs are managed by the lay members of the Diocesan Conferences.

The following acts were passed by the Assembly and received royal assent in 1926: The Rural Deaneries of Pontefract and Hemsworth (Transfer) Measure, and the Brialington Parishes (Transfer) Measure, transferring these parishes from one diocese to another; the Parish of Manchester Division Act, 1850 (Amendment) Measure severing the Canonries in the Cathedral Church of Manchester from benefices attached thereto; First Fruits and Tenths Measure, abolishing First Fruits and Tenths from July 16, 1926; Ecclesiastical Commissioners Measure, including clauses for the augmentation of Archdeacons from £200 to £300 per annum, for the upkeep of ancient episcopal residences, the payment of Bishops' costs in legal proceedings, and for funds to aid in the formation of new Bishoprics; Clergy Pensions Measure, providing a pension of £200 per annum at the age of 70 and correspondingly lower pensions if incapacitated before pension age, returnable premiums with 2½ per cent interest on death before pension age, a full year's pension if death occurs in first year of retirement, on conditions of payment of 3 per cent of annual net income and 40 years' service for full pension at the age of 70; Episcopal Pensions Measure, providing for pensions for Diocesan Bishops in England; Benefices (Ecclesiastical Duties) Measure, amending and consolidating the law relating to the due performance of Ecclesiastical Duties of Benefices and making provision for the stipends of curates appointed under the Measure.

The following appointments took place during the year: Dr. E. A. Burroughs as Bishop of Ripon; Dr. Lionel Ford as Dean of York; Canon J. J. Scott, elected Prolocutor of the Lower House of Convocation of York; the Rev. B. O. F. Heywood as Bishop of Southwell; the Rev. B. S. Batty to the newly constituted Suffragan Bishopric of Fulham; the Rev. R. S. M. O'Ferrall as Bishop of Madagascar; the Rev. H. S. Pellham as Bishop Suffragan of Barrow-in-Furness, replacing Dr. Campbell West-Watson, who was appointed Bishop of Christ Church, New Zealand; the Ven. T. W. Cook as Bishop Suffragan of Lewes; the Rev. Hugh I. Embling as Assistant Bishop in the Diocese of Korea; Canon R. G. Parsons to the newly constituted Suffragan Bishopric of Middleton; the Rev. Leonard Kitching as Bishop on the Upper Nile; the Rev. W. V. Lucas as Bishop in Masai. Dr. C. A. Seagar was elected Bishop of Ontario; the Ven. L. R. Sherman elected Bishop of Calgary; and Archdeacon C. A. Cherrington to the new Bishopric of Waikato, New Zealand. The Rt. Rev. C. C. B. Bardsley was translated from the Diocese of Peterborough to the newly constituted see of Leicester, and the Rt. Rev. P. M. Herbert, Bishop Suffragan of Kingston-on-Thames was translated to the newly constituted Diocese of Blackburn.

In 1925, the receipts amounted to £121,414, of which sum Diocesan contributions amounted to £100,830. Expenditures for the year were as follows: ex-service and civilian training, £25,950; religious education, £16,896; special purposes, including the Japanese Relief Fund, £920; missionary council, £3,148; pensions committee, £960; investment of gifts to capital, £7521;

clergy pensions, £47,000; general administration, £19,019. In 1925 the number of baptisms was 477,954, the Easter communicants in the various Dioceses numbered 2,518,874. The total gross income of 12,908 incumbents was £6,402,150, including £200,766 Easter offering. The stipends of the assistant clergy were £1,060,292. The amount of voluntary parochial contributions was £7,232,433, and the total from all sources £9,808,900.

Officers of the assembly in 1926 were: chairman, the Archbishop of Canterbury; vice-chairman, the Archbishop of York; treasurer, Col. Sir R. Williams, Bart.; secretary, Sir Philip W. Baker-Wilbraham, Bart.; chairman of the House of Bishops, the Archbishop of Canterbury; chairman of the House of Clergy, the Dean of Westminster; chairman of the House of Laity, the Earl of Selborne, K. G. Headquarters are at 8, Dean's Yard, Westminster, S.W. 1, London.

**ENTOMOLOGY, ECONOMIC.** The continued spread and increased density of infestation by the European corn borer, and the spread of the Japanese beetle and of the Mexican bean beetle were the most striking features in the field of economic entomology in the year 1926.

**EUROPEAN CORN BORER.** The European corn borer continued its spread, adding 20,000 square miles in 1926 to the infested area, which at the end of the year extended to Berrien County, Michigan, and Noble County, Indiana. A survey made during the year in the original infested area in New York showed an increase in the density of infestation of 300 per cent over that recorded in the survey made in 1924. The work of introducing its natural parasitic enemies from Europe proceeded most satisfactorily, three additional species having become established during the year, and several other new and promising parasites discovered by investigators sent from this country to Italy and France. In control work, the States of Michigan, Ohio, and Pennsylvania promulgated compulsory clean-up regulations, and favorable results were becoming apparent. Among the most important and promising recent results in investigational work was the development of agricultural machinery to meet in an economical manner the needs of the corn borer clean-up requirement. It appears to have been amply demonstrated, both in Europe and the United States, that the control of this pest depends largely if not principally upon the manner of disposal of the cornstalks and cobs. To combat the insect in its winter quarters, it is necessary to destroy or ensile the entire stalk of the plant. The investigational work aimed at the perfection of a device which will cut the corn at the ground line and which can be attached at a reasonable cost to the existing corn-harvesting machinery had met with success, and the large-scale manufacturers of farm machinery had adopted the device and placed it on the market. In addition, there had been brought to a high state of development machinery which it was believed would successfully pick and husk corn and shred the residue for silage or for immediate return to the soil at slight increase in present harvesting cost. An international conference of American and Canadian agricultural officials, experiment station directors, agronomists, and entomologists of nearly all the corn-belt States, manufacturers of farm machinery, and others was held to consider the

control problem, and the infested area in Ohio, Michigan, and Ontario was visited on October 23 and 24. A Congressional appropriation of several million dollars for an intensive clean-up campaign was recommended by the President at the close of the War.

**JAPANESE BEETLE.** The Japanese beetle continued to spread, having extended its range up the Hudson River as far as Ossining, N. Y., to Stamford, Conn., southward to Long Island, and westward in Pennsylvania to Harrisburg and northward to Easton. By June 30 the quarantine area had been increased from 5122 to 6047 square miles. A material known as coated arsenate of lead, which has been developed for use as a spray, is now commercially manufactured and on the market. The advantage gained in the use of this form lies in its greater adhesive properties, which reduces the number of sprayings that may be necessary to effect control. It is recommended for use on shade trees and ornamental plants, but is unsafe for use as a general fruit spray, since too large a quantity of arsenate would remain on the fruit at the time of harvest. Pyrethrum soap, developed as a contact killer, has given satisfactory results for this purpose, and under experimental conditions kills of 95 and 98 per cent have been made.

**ORIENTAL FRUIT MOTII.** The spread of the oriental peach moth continued, it having been found late in 1925 to infest the Niagara fruit district of Ontario from Hamilton to the Niagara River, and a light infestation occurred in 1926. An infestation by what was apparently this pest was recorded for the first time from Michigan. Studies of its life history have shown that the pest develops five broods of larvæ each year at Riverton, N. J., and that some of the third, many of the fourth, and all of the fifth overwinter in cocoons. Parasites were found to play an important part in its control in that State. A bait consisting of fermenting molasses was found to attract the moths, about 50 per cent of those captured in this way being females which had not deposited their eggs. The Federal Bureau of Entomology confirmed a prophecy made the preceding year, that this fruit moth would not be a serious pest under Georgia conditions. This is due to the fact that the latest variety of peach grown commercially matures about midsummer, and this greatly interferes with the late summer and fall food supply of the larvæ. This is considered very fortunate, as seven generations were reared in that State in 1926.

**MEXICAN BEAN BEETLE.** There was a very material increase in infestation by the Mexican bean beetle in 1926, it having been reported for the first time in Garrett and Washington Counties, Maryland; in Virginia it advanced near to the eastern border and in North Carolina approached the centre of the State. Its invasion of Ohio was completed, and it advanced westward to Clinton County, Indiana, and in Pennsylvania eastward to Dauphin County near Harrisburg.

**PINK BOLLWORM.** The pink bollworm was held to the infested areas in the Upper Rio Grande and Pecos Valleys in western Texas and New Mexico through quarantines and controlling and safeguarding the movement from such areas of products in which the pest might be carried. The important developments in the infested areas for the year ended June 30, 1926, include (1) the rediscovery of the insect in the Mesilla Valley for the first time since 1922, (2) the rediscovery

of the insect in the Pecos Valley of New Mexico for the first time since 1921 and the extension of the infestation in that valley to a point 40 miles north of the 1921 infestation, (3) the discovery of a number of isolated infestations located from 35 to 50 miles from any other known infestation, (4) the increased destructiveness of the insect in the Big Bend and in the El Paso Valley, and (5) the discovery of insect injury at Odessa, Tex., having all the characteristics of pink bollworm injury.

**GIPEY MOTII.** In work with the gipsy moth less infestation was found in the barrier zone than during the preceding year, the pest having been exterminated in some of the colonies and the quarantine lifted from 75 towns in Vermont, 33 in Massachusetts, and 5 in Connecticut. The colonies occurring on Long Island were carefully treated and should be completely stamped out. A hurried survey indicated that there had been a marked increase in abundance throughout the eastern part of the infested territory. Conditions on Cape Cod were more serious than during the preceding year, defoliation taking place over thousands of acres of woodland, extending in many localities as far as the eye could reach. It is estimated that 47,000 acres were completely defoliated and 11,000 acres partially defoliated on Cape Cod.

**BROWN-TAIL MOTH.** The brown-tail moth was somewhat more abundant than throughout the preceding year, particularly in southern New Hampshire, the parasitism averaging slightly less.

**BOLL WEEVIL.** Climatic conditions unfavorable to the boll weevil resulted in a great reduction in infestation by the pest and a correspondingly large cotton crop. Comparatively slight injury was caused to the main crop, but late in the season there was considerable injury to the top crop. Its principal injury was caused in the delta region of Mississippi, Louisiana, and southern Alabama. The growing of cotton in the region of the *Thurberia* boll weevil infestation in Arizona has resulted in its becoming more or less established in cotton in the valley of the Santa Cruz River, from some distance north of Tucson nearly to Nogales.

**SWEET POTATO WEEVIL.** The campaign for control of the sweet potato weevil in Mississippi and Alabama has been very successful, infestations in these States having been reduced from the original 185 farms infested to but three infested farms in 1926.

**ALFALFA WEEVIL.** The alfalfa weevil continued its eastward spread in Wyoming, entering Goshen and Carbon Counties near the Nebraska State line, and it invaded four additional counties in Colorado. The importance of infestation with this pest in eastern Wyoming lies in the fact that this area is practically continuous with the alfalfa growing areas of Nebraska and Kansas.

**THE COTTON HOPPER.** The cotton hopper or so-called cotton flea, which is, perhaps through a virus which it transmits, the cause of a disorder of the cotton plant marked by the shedding of the very small squares and an abnormal type of growth, appeared in Alabama for the first time and caused serious injury to cotton. In many cases the bottom crop was almost entirely destroyed as well as a good portion of the middle crop. This pest has for a number of years been the source of injury to the crop along the Gulf

Coast in Texas, and in 1924 caused injury in South Carolina and Georgia.

**TURNIP OR AUSTRALIAN TOMATO WEEVIL.** This introduced weevil has continued to spread in the Gulf region and is now found in 24 counties in southern Mississippi, 8 parishes in Louisiana, 7 counties in Alabama, and 2 counties in Florida. It has also recently been found in the vicinity of Santa Cruz, Calif., attacking carrots. The pest has been found to be satisfactorily controlled by the use of arsenicals in spray and dust forms.

**CITRUS APHID.** The citrus aphid was reduced to negligible numbers in 1926 due to climatic conditions, comparatively little injury being caused.

**APICULTURE.** The controlled mating of queen bees was reported to have been accomplished, for the first time in history, by Lloyd R. Watson of Alfred, N. Y. This discovery makes possible the improvement of the honey bee by scientific breeding.

**SODIUM FLUOSILICATE.** This insecticide has been tested and found to effectively control a number of important pests. It was found to be very effective against the striped blister beetle on soy beans, and its discovery as a control measure has resulted in the bringing about of a general planting of soy beans as a rotation crop on rice plantations in Louisiana.

**PEACH TREE BORER CONTROL.** Tests made in Indiana during the year have shown that, while some small injury may result from the application of paradichlorobenzene to two-year-old peach trees when applied in late August under extremely high soil temperature and a very dry soil, it apparently has no permanent ill effect on the trees. Peach seedling stock in nurseries was, however, seriously injured by the treatment, and a number of the trees were killed.

**INSECT CONTROL BY VACUUM.** It has been found that a high vacuum varying from 24 to 29 in. can be depended upon to kill carpet beetles and clothes moths. Clothes moths in trunks and other containers were killed at the end of one- and two-day exposures. Carpet beetles were also killed, but only after a longer exposure. This discovery is of particular importance to warehousemen who store household goods.

**INSECT QUARANTINES AND EMBARGOES.** On January 1, 1926, an embargo was placed upon the importation of narcissus bulbs with a view to preventing the further introduction of the bulb flies and eelworms. After a further investigation in Spain, the embargo placed upon Spanish grapes to prevent the introduction of the destructive Mediterranean fruit fly in this way was reaffirmed. The general infestation of chestnuts from abroad with insect pests led to the placing of a quarantine on October 1 upon nuts and acorns from Europe to prevent their introduction. On July 15 a quarantine was placed upon the State of Arizona for the purpose of preventing the spread of the *Thurberia* cotton boll weevil from the infested area. In order to control the spread of certain injurious insects occurring in the soil about the roots of plants from Porto Rico and Hawaii, a quarantine was placed upon these territories which became effective on March 1. An interstate quarantine was placed upon American grown narcissus bulbs on July 15 in order to protect the sections not infested by the bulb flies. Domestic quarantines extended during the year include those for the

European corn borer on August 4, the satin moth on November 15, and the Japanese beetle on November 17.

**EPILEPSY.** Dr. L. Pierce Clark sums up the subject of diet in epilepsy in the *Boston Medical and Surgical Journal* for August 12. Perhaps the oldest attempt in this direction is the bland diet, based on the fact that as a rule the epileptic is inclined to eat to excess and bolt his food, in which case it should be as digestible and as free from irritating quality as possible. Another old diet, and one which may be conjoined with the first mentioned, is the low protein, which may however have been based on the false assumption that the nitrogen of the food is the source of muscular energy; although it had been learned empirically that these patients are often better off on a milk-vegetable diet. Still another plan, which is in a way opposed to the strictly bland diet, is the laxative, in which bran foods enter largely, to keep the bowels active, in the belief that constipation and autointoxication favor the convulsive habit. The salt-poor and salt-free diets, while otherwise in harmony with scientific dieting, were introduced chiefly to economize the use of bromides and thereby prevent their ill effects. The starvation treatment consists of occasional complete fasts of about two weeks each which benefit some patients although aggravating certain cases. Dr. Clark makes use of each and all of the principles in the above diets—low protein, bland and laxative, combined with occasional resort to the starvation and salt-free plans.

**EPI'RUS.** A geographical expression applied to a territory, the northern part of which belongs to Albania and the southern part to Greece. The boundaries are indefinite. The Greek portion corresponds to the departments of Yanina and Prevesa, with populations in 1923 of 173,304 and 52,462 respectively. Northern Epirus had an estimated population of 250,000.

**ERIE CANAL, ANNIVERSARY OF.** See **CELEBRATIONS**.

**ERITRE'A.** An Italian colony in Africa. It lies on the coast of the Red Sea, extending from Cape Dumeirah and the Strait of Bab-el-Mandeb to Cape Kasar, a distance of 670 miles. Area, 45,754 square miles; population, at the census

of 1921, 402,793 natives and 4251 Europeans. The seat of government is Asmara, situated 7705 feet above sea level, with a population of 14,711, of whom 2500 are Europeans. Massawah is the principal trade centre, with a population of 2275 in 1923. The natives are chiefly Coptic Christians and Mohammedans and they speak a dialect of Abyssinian in the plateau region and Arabic in the lowlands. The local trade is almost entirely confined to camels, oxen, sheep, goats, and their products. Although there is abundant pastoral land the pastoral population is largely nomadic. There is considerable trade in palm nuts, and pearl fishing is pursued at Massawah and in the Dahlak Archipelago. In 1924 the imports through Massawah were 146,129,077 lire and the exports, 85,086,338 lire. In the same year the imports through the land frontier amounted to 54,252,000 lire and the exports to 34,942,000 lire. The tonnage of vessels which entered Massawah in 1924 was 493,695 tons. For the fiscal year 1925-26, the revenue and expenditure of the colony were estimated at: Colonial revenue, 36,439,000 lire; expenditure for colonial administration, 24,674,000 lire and for military purposes, 11,765,000 lire. Governor at the beginning of 1926, Dr. Jacopo Gasparini.

**ERIVAN.** See **ARMENIA**.

**ERYSIPELAS.** This common affection has taken on a new interest since the discovery of the cause of scarlet fever, for it is recognized that there is not one but an entire group of so-called hemolytic streptococci with characters in common yet able to cause very different maladies and to produce different antibodies when the toxins are injected into the blood. Some of the members of this group cause respectively scarlet fever, erysipelas, puerperal and wound sepsis, phlegmonous suppurations, etc. In the *Journal of the American Medical Association* for May 8, Birkhaug reports the results of his investigation of erysipelas along the lines of Dick's work with scarlet fever. A toxin prepared by cultivating the streptococcus of erysipelas causes the same kind of skin reaction as is obtained in the Dick test for susceptibility to scarlet fever. The blood of convalescents from erysipelas will also neutralize this toxin. The author has prepared an antiserum from the horse, and has treated 60 cases of erysipelas with it to determine whether this behaves in a specific manner. He found that both the pulse and temperature fell. Those treated early had the disease cut short while even in the late cases the disease responded favorably. He does not yet know whether the antiserum is a pure antitoxin or a mixed product.

In this connection mention may be made of swine erysipelas, which has no connection with the human disease, but is now known to be communicable to man. Since 1899 many cases have been reported, the majority from handling the cultures used for immunizing hogs, while others were due to handling the infected meat. Swine erysipelas was not recognized in the United States prior to 1920, and whether it has yet been transmitted to man is not surely known.

A very similar affection known as "erysipeloid" has been known for many years which appears at times on the hands of butchers, cooks and others who handle game and fish and in shopkeepers who deal in herring, cheese, etc. In the United States a similar affection attacks fishermen and causes considerable interruption of business. Authorities differ as to whether

these are all the same or different diseases. Some of them make swine erysipelas and erysipeloid with other similar affections of the hands, one and the same disease, others regard them as distinct and still others note the strong resemblance and difficulty in distinguishing between them. Consult article by Klauder in the *Journal of the American Medical Association* for February 20.

**ESPERANTO.** See INTERNATIONAL LANGUAGE.

**ESSAYS.** See LITERATURE, ENGLISH AND AMERICAN; FRENCH LITERATURE; GERMAN LITERATURE; ETC.

**ESTHONIA.** A Baltic state comprising the following portions of the former Russian Empire: The province of Esthonia, the islands of Moon Sound, the northern part of Livonia, part of the northwestern part of the district of the Pskov government, and a small portion of the Petrograd government; declared independent Feb. 24, 1918, and recognized by the Supreme Council, Jan. 26, 1921. Capital, Tallinn (Reval).

**AREA AND POPULATION.** The total area is about 18,354 square miles; population, at the census of 1922, 1,110,538, of whom 92 per cent were Esthonians, 1.5 per cent Germans, and 6.5 per cent Russians and other nationalities. Five-sixths of the population are Lutherans, and the rest Greek Orthodox, Roman Catholic, etc. Tallinn or Reval, the capital, had a population of 130,000 in 1924. Dorpat (Tartu), the seat of the university of the same name, had about 50,000 inhabitants. Other large towns are: Narva, a manufacturing town, with about 27,000, and Parnu, on the Gulf of Riga, with about 18,500.

**EDUCATION.** Elementary education is free and compulsory. In 1922-23 there were 1356 elementary schools, of which 1324 were supported by local authorities and the rest private schools. There were 221 higher schools and 85 middle schools for general education. For special or professional education there are agricultural, commercial, navigation, and industrial and art schools. For the higher learning there is the University of Dorpat (founded in 1632) which had 3985 students in 1924, and the Technical Institute at Reval, with 380 students in 1924.

**PRODUCTION.** Agriculture is the chief occupation. The total area of about 10,851,648 acres is divided as follows: Forest land, 2,220,002 acres; fields, 2,532,799 acres; meadows, 2,602,274 acres; pastures, 1,836,302 acres; untillable land, 1,032,206 acres (including a peat bog of 496,112 acres). The principal crops are rye, wheat, barley, potatoes, and oats. No later figures on area and production are available than those given in the preceding YEAR BOOK. The livestock census of 1924 showed 500,508 head of cattle, 607,030 sheep, 284,530 pigs, and 207,023 horses. In 1923 Esthonia had 1266 industrial establishments which employed 45,424 workmen.

**COMMERCE.** According to the United States Bureau of Foreign and Domestic Commerce, the active development of Esthonian foreign trade in 1925 resulted in a favorable balance of 10,000,000 Esthonian marks. This export surplus is attributable largely to the rapid increase of agricultural production and to the development of local industries. Total imports during the year were valued at 9,654,600,000 marks (about \$25,815,000) and total exports at 9,664,600,000 marks (about \$25,841,000).

VALUE OF ESTHONIAN FOREIGN TRADE IN 1925

\* The Esthonian mark averaged 392 to the dollar in 1924 and 374 in 1925.

**FINANCE.** The Esthonian budget for 1926 balanced at 7,725,000,000 marks, or about 300,000,000 marks higher than the budget proposal for 1925. During the year the government was planning a readjustment of the Esthonian monetary system. In 1924 the Scandinavian gold crown was adopted as the legal standard but was not placed in circulation. With the Esthonian mark now stable at 375 marks to the dollar, the gold crown would be equal to 100 paper marks.

**COMMUNICATIONS.** During 1924, 971 vessels of 537,470 tons entered and 997 vessels of 546,959 tons cleared the port of Reval. The total railway mileage in 1924 was 1702 kilometers or 1057 miles.

**GOVERNMENT.** According to the constitution of the Esthonian republic, passed by the Constituent Assembly on June 15, 1920, and put into force December 20 of the same year, executive authority is in the hands of a state head or "State Elder" and a ministry, both chosen by and responsible to the State Assembly; legislative power, in the hands of the State Assembly of 100 members, elected for three years on the basis of proportional representation and by direct, universal, and secret suffrage. The Assembly forms the government and accepts its resignation, promulgates the laws, passes the budget, decides the financial policy generally, ratifies treaties, etc. The principle of the referendum is recognized for the proposal or amendment of laws, but not in relation to measures affecting the budget, or war, peace, and foreign treaties. State Elder at the beginning of 1926, Jaan Teemant (Peasants' Union).

**HISTORY.** Early in March the Esthonian government passed a law providing for payment for the land expropriated from the large landowners in October, 1919. The terms called for payment at the market rate of land in 1919, and specifically stated that any landowner hostile to the government at the time independence

was gained or shortly thereafter would receive no compensation.

As a result of the elections held for the Third Esthonian State Assembly in May, the following cabinet was approved by the new assembly on July 23: State Head, Jaan Teemant; Foreign Affairs, Dr. F. Akel; Interior, H. Laretei; Agriculture, O. Koster; Education, J. Lattik; Communications, A. Kerem; Trade and Industry, K. Kornel; Social Welfare, O. Tief; Finance, L. Sepp; Justice, J. Sepp; War, J. Soots.

**ESTILL, THOMAS.** Commissioner of the Salvation Army in the Eastern Territory of the United States, died at Mt. Vernon, N. Y., October 19. He was born at Whitby, England on Mar. 13, 1859, and originally intended to follow a trade but was converted by the Salvation Army, then known as the Christian Mission, while on a visit to Nottingham in 1877. After five months' consideration he decided to join the Army and devote the rest of his life to its interests. He went to London for a conference with General Booth, was made an officer and sent back to take charge in Nottingham. Almost from the beginning the Commissioner was intrusted with positions of responsibility, and he was regarded as one of the most thorough organizers in the whole movement. Wherever he went he stimulated the movement and left it on a firm basis when he left. He was one of the leading authorities in the Salvation Army on the Bible and was specially proficient in his knowledge of the Old Testament. He served the Army continuously for forty-eight years and held positions of responsibility on all the continents except South America. His last eighteen years were spent in the United States, the first twelve as commander of the Central Territory, with headquarters in Chicago, and the last six as commander of the Eastern Territory with headquarters in New York.

**EUCKEN, RUDOLF CHRISTOPH.** German philosopher, died at Jena, Germany, September 15. He was born at Aurich, East Friesland, Jan. 5, 1846, and was educated at the gymnasium of that town, and at the University of Göttingen where he studied philology, history, and philosophy, as well as at Berlin. After teaching in various schools he was appointed professor of philosophy at Basle in 1871, holding this chair until 1874 when he was called to Jena, a position he held until his retirement in April, 1920, after 46 years of service. Eucken was known as one of the German philosophers who revolted against the prevailing tendency to treat man and life from the standpoint of the physical and biological sciences, rather than by his spiritual interests. His writings made for him a wide circle of readers. In 1908 he received the Nobel prize for literature, and visited America in 1912 as exchange professor at Harvard University, receiving many honors from other American institutions. In 1914, he was a visiting professor at the Universities of Tokio and Kioto in Japan. During and after the World War he was a vigorous champion of the cause of the Fatherland and was one of a group of German intellectuals who prepared a manifesto disclaiming the responsibility of Germany for the beginning of the struggle.

Eucken was a prolific author, his works in-

cluding some of a popular nature, as well as those of primary interest to philosophers. These include: *Geschichte und Kritik der Grundbegriffe der Gegenwart* (1878; 2d ed., 1893; Eng. trans., *The Fundamental Concepts of Modern Philosophic Thought*, 1880); *Beiträge zur Geschichte der neuern Philosophie, vornehmlich der deutschen* (1886); *Die Philosophie des Thomas von Aquino und die Kultur der Neuzeit* (1886); *Die Einheit des Geisteslebens* (1888; Eng. trans., *The Life of the Spirit*, 1909); *Die Lebensanschauungen der grossen Denker* (1890; 3d ed., 1899; Eng. trans., *The Problem of Human Life as Viewed by the Great Thinkers*, 1910); *Der Kampf an einen geistigen Lebensinhalt* (1896); *Geistige Strömungen der Gegenwart* (3d ed., 1904; Eng. trans., *Main Currents of Modern Thought*, 1912); *Grundlinien einer neuen Lebensanschauung* (1907; Eng. trans., *Life's Basis and Life's Ideal*, 2d ed., 1912); *Religion and Life* (1911); *Can We Still be Christians?* (1914); *Geistige Förderungen der Gegenwart* (1918); *Der Sozialismus und seine Lebensgestaltung* (1920); and his autobiography, *Lebenserinnerungen, ein Stück deutschen Lebens* (1921). Among his articles which have been translated into English are the following: "Liberty in Teaching in the German Universities" (1897); "Are the Germans Still a Nation of Thinkers?" (1898); "Progress of Philosophy in the Nineteenth Century" (1899); "The Finnish Question" (1899); "The Philosophy of Friedrich Froebel" (1900); "The Present Status of Religion in Germany" (1901). The following biographies of Eucken have been published: Pöhlmann, *R. Euckens Theologie mit ihren philosophischen Grundlagen* (Berlin, 1902); Siebert, *R. Euckens Welt und Lebensanschauung* (Langensalza, 1904); Gibson, *Rudolf Eucken's Philosophy of Life* (New York, 1907).

**EUCLID ZONING DECISION.** See CITY PLANNING.

**EULENBURG, ERNST.** A famous German music-publisher, died in Leipzig, in September. He was born in Berlin, Nov. 30, 1847, and received his musical education at the Leipzig Conservatory. In 1874 he established in Leipzig the firm bearing his name, which soon was famous for its fine pocket editions of the masterpieces of chamber-music. When, in 1892, Eulenburg bought the rights of Payne's miniature edition of orchestral scores, the business of the firm increased enormously through the gradual addition to the collection of practically all the masterpieces of orchestral literature. After the expiration of the copyright, in 1913, Wagner's complete dramatic works were added.

**EUROPEAN CORN BORER.** See CORN; ENTOMOLOGY, ECONOMIC.

**EVANGELICAL CHURCH.** A denomination formed by the union of the Evangelical Association and the United Evangelical Church. The former was the outgrowth of a religious movement started in Pennsylvania in 1800 by the followers of Jacob Albright. In 1892 a number of ministers and members organized themselves into the separate denomination known as the United Evangelical Church. At length the growing conviction that the two churches should be reunited led to the appointment of commissions, which drew up the so-called Enabling Act. The new organization was officially established at Detroit, in 1922. At the time of merging, the Evangelical Association had 167,416 church mem-

bers and the United Evangelical Church 92,001. At the end of 1920 there was a total membership of 251,704. There were 1930 itinerant preachers and 417 local preachers. Of 24,289 received into church membership during the year, 15,533 came on profession of faith. Sunday schools numbered 2020, of which 681 were in the foreign mission fields in China, Japan, Germany, and Switzerland. Of the total enrollment of 388,826, China had 4070; Japan 3785; Germany 29,848; and Switzerland 15,350. The total amount raised by the Sunday schools was \$592,119.82. The Christian Endeavor Society membership was 75,737. There were 1402 Woman's Missionary Societies in the denomination, with a membership of 42,885. The total value of all property was \$36,622,520.33. The money raised during the year totaled \$6,852,686.46, an average of \$27.97 per member. The chief schools of the denomination are: North Central College and Evangelical School of Theology, Naperville, Ill.; Western Union College, Le Mars, Iowa; Albright College, Myers-town, Pennsylvania; Schuykill College and School of Theology, Reading, Pa. Two orphanages and six Old People's Homes were maintained in the United States, as well as several hospitals. The church had twenty-five conferences in the United States one in Canada, one in Japan, two in Germany, one in Switzerland. There were two publishing houses. The Church issues two official papers, the *Evangelical-Messenger*, in English, and *Christliche Botschafter*, in German. It was planned to hold the next general conference in Milwaukee, in October, 1930.

**EVANGELICAL SYNOD OF NORTH AMERICA.** A religious denomination formed by a union of Lutheran and Reformed churches, effected in 1840, at Gravois Settlement, Mo., and by subsequent similar unions, forming organizations which consolidated in 1877. The essential doctrine of the group rests on the Biblical interpretations furnished by the Augsburg confession, Luther's catechism, and the Heidelberg catechism, allowing liberty where these do not agree. The church is organized into 19 districts, with extensive power of self-government. Presidents of districts, clerical delegates, and lay delegates meet in general conference every fourth year. A quadrennial synod was held in 1925. In 1925 the organization included 1307 pastors, 1115 church members, and 1200 Sunday schools with 181,044 members. Money raised by the denomination for all purposes in 1925 amounted to \$5,967,332. Church property was valued at \$38,729,421. Missionary work was carried on in the United States, India, Honduras, and South America. In the United States there were over 100 missionaries, men and women, active in some 135 communities. The Board of Foreign Missions reported an income of over \$112,000 for 1925, and had 14 men, one of them a medical worker, and 17 women, as missionaries in India, in addition to 333 native workers. In Honduras there were 11 missionaries at two stations. The denomination maintains three institutions of learning; Eden Seminary, St. Louis, Mo.; Elmhurst College, Elmhurst, Ill.; and Robinson Academy, Waco, Texas. The chief periodicals published are *Der Friedensbote* and *The Evangelical Herald*.

**EVOLUTION.** See PHILOSOPHY; ZOÖLOGY.

**EXCAVATIONS.** See ARCHEOLOGY.

**EXCHANGE, FOREIGN.** See FINANCIAL REVIEW.

**EXHIBITIONS, ART.** See ART EXHIBITIONS.

**EXNER, FRANZ.** Austrian physicist, died at Vienna, Austria, November 15. He was born in Vienna in 1858, and was the son of the Franz Exner who played so large a part in the reformation of the University of Vienna. Other sons of this family achieved fame in different departments of science, and law. Franz Exner was the youngest son and turned his attention at an early age to the problems of physics. Among his inventions was a portable electrometer. He made his greatest successes in the investigation of atmospheric electricity, spectrum analysis and radium studies. He was the founder of the Vienna Radium Institute.

**EXPERIMENT STATIONS.** See AGRICULTURAL EXPERIMENT STATIONS.

**EXPLORATIONS.** The expeditions of the year were divided between geographical and research purposes. Apart from the narrow lanes across the Arctic Ocean, recorded under POLAR RESEARCH (q.v.), there have been no incursions into unknown regions. Rapidity of cursory exploration has been accomplished by the use of the airplane for surveys covering general physical conditions. Of these the most notable were the surveys of the archipelago of Nova Zembla, of the Tongass Forest of southeast Alaska, of the tidal forests of the Irrawaddy delta, and the traverses over the North-polar Ocean.

Scientific explorations were numerous, sharply divided into two classes. First, were special researches for the extension of current scientific knowledge; second, archeological work for the elucidation of historical or religious problems. Of these researches about 40 per cent were in archeology or ethnology; 25 per cent in geology, mineralogy or paleontology. The most valuable results were those connected with the development of the Maya civilization in Central America, and the excavations of buried cities in Asia Minor. Unfortunately, disturbed conditions in China prevented a renewal of the important paleontological researches in Mongolia. The record of American researches precedes the list of work done by foreign nations.

**AMERICAN RESEARCH EXPEDITIONS.** In number, extent and importance, these explorations exceed those of all other nations. Conspicuous by the amount and character of their investigations were the American Museum of Natural History of New York, the Carnegie Institution of Washington, the Field Museum of Chicago, and the Smithsonian Institution. Explorations in the United States are omitted, and in all cases the lack of space compels the absence of details. There are given only the names of the responsible institutions, the leader of the expedition, the kind of research and the regions visited.

**CALIFORNIA.** *University of California.* Loeb, ethnology, Dutch East Indies. *Pacific School of Religion,* Berkeley, Badé, Mizah Tombs, Palestine.

**CONNECTICUT.** *Yale University.* Dougherty, archeology, Southern Babylonia; Gregory, archeology, Hawaii; Record, forestry, Central America; Wissler, archeology, Australia.

**DISTRICT OF COLUMBIA.** *Archeological Society.* Gamio, archeology, Guatemala.

**CARNEGIE INSTITUTION.** Morley, in general charge of researches on Maya civilization in Mexico and Guatemala; Morris, archeology, Chichen Itza, Mexico; Ricketson, archeology, Uxactun, Guatemala.

*National Geographic Society.* Abbott, solar

radiation, Mt. Brukkalos, Southwest Africa, in coöperation with the Smithsonian Institution.

*Smithsonian Institution.* Walcott, geology, Canadian Rockies; Abbott, solar physics, Mt. Brukkalos, Africa; Aldrich, diptera, Guatemala; Graham, biology, Szechwan, China; Hrdlicka, anthropology, Africa, Alaska, Asia, Australia; Kellers, zoölogy, Sumatra; Greene, diptera, Panama; Leonard, botany, Haiti; Mann, mammals, Africa; Schmidt, crustacean fauna, South America; Standley, botany, Costa Rica.

ILLINOIS. *Field Museum, Chicago.* Cherrie, fauna and flora, Brazil, Bolivia; Conover, zoology, Central Africa; Fisher, archeology, Megiddo, Palestine; Langdon (coöperating with *Oxford University*), archeology, Sumerian cities, Mesopotamia; MacMillan-Rawson, ethnology and zoölogy, Greenland and Labrador; Riggs, paleontology, Northern Argentina. Heller, zoology, Uganda; Kroeber, history (coöperating with Peru) Peru; Linton, ethnology, Madagascar; Osgood, fauna, Abyssinia; Roosevelt, zoology, India and the Pamirs; Weberbauer, botany, Peruvian Andes; Zimmer, zoölogy, Tanganyika, Africa.

MASSACHUSETTS. *Harvard University:* Reisner and Wheeler, Giza tombs, Egypt; Spinden, archeology, Central America; Strong, tropical diseases, Central Africa.

MISSOURI. *Xenia Theological Seminary*, St. Louis: Kyle, archeology, Palestine, coöperating with *American School of Oriental Research*.

NEW JERSEY. *Princeton University:* Shear, archeology, Corinth, Greece.

NEW YORK. *New York Botanical Garden:* Gleason, botany, Porto Rico.

*American Museum of Natural History;* Akeley, mammals, Central Africa; Andrews (aided by *Field Museum, Chicago*) archeology, Mongolia; Anthony and Goodwin, (aided by *N. Y. Academy of Sciences*), fauna and flora, Porto Rico; Beck, ornithology, South Sea Islands; Burden, reptiles, Komodo Island; Chapin, Sage and Matthews, ornithology, Africa; Chapman, ornithology, Canal Zone; Griscom, ornithology, Yucatan; Matthew, fossils, India; Miner, fishes, near the Bahamas; Morden-Clark, Asiatic fauna, Central Asia; Murphy, birds and fishes, Mediterranean Sea; Putnam and Raven, oceanic species, West Greenland seas; Rockefeller, ornithology, Hudson Bay; Tate, mammals, Argentine and Bolivia; Taylor and Anthony, birds and mammals, Africa; Van Name, marine life, Pearl Island; Vernay and Faunthorpe, mammals, India.

*New York University:* Riefstahl, archeology, Anatolia.

OHIO. *Cleveland Museum of Natural History:* Simmons, botany and mammals, Islands in South Atlantic Ocean.

PENNSYLVANIA. *University of Pennsylvania:* Rove, archeology, Resian, Palestine; Spieser, archeology, Mesopotamia; Woolley and Le Grain (in coöperation with *Oxford University*), extended and important excavations, Ur, Palestine.

AFRICA. *British School of Archeology:* Caton-Thompson (Miss), archeology, Fayum, Central Egypt; Gardner (Miss), geology, Fayum; Sanford, archeology, between Thebes and Sohag. (Also see American Expeditions, ante.)

FRANCE. Researches in northern Africa, especially those of the *Morocco Geographical Society*, were interrupted by disturbed conditions: Grebaut, philology, Ethiopia; Reygasse-Pongd, ethnology, Hoggar, Sahara; Dember, primitive tribe,

Kalahari Desert; Ruwenzori Kuvi expedition, fauna, Central Africa.

SOCIETY OF NATIONS. Its agents made medical surveys of African colonies.

ASIA. Very extensive and important archeological excavations were made in Asia Minor, and paleontological discoveries in Mongolia. *British School of Archeology*, Mackay, archeology, Bahrain Island, Persia. GERMAN. Sellin, archeology, Shechem, Palestine.

INDIAN GOVERNMENT (aided by *Royal Geographical Society*): Mason, exploration, high Himalayas. (See also American Expeditions, ante.)

RUSSIA. To maintain its sovereignty, the Soviet authorities took action for the occupation of islands off the Arctic coasts. Matussiiev and Kalwitz, starting from Leningrad in August, surveyed parts of the archipelago of Nova Zembla, occupied by Samoyeds. See also WRANGELL ISLAND.

*Russian Geographical Society.* Schokalsky continued his marine researches in the Black Sea; Koslov renewed his Asiatic explorations; his activities in 1926 were exerted in the Gobi Desert, where he discovered fossils of prehistoric vertebrates, and in the Khangai mountains of Mongolia, excavating ancient tombs; Meehaninoff, unearthed Urali monuments, Azerbaijan; Keslov, botany, Kara-Kum Desert.

ITALIAN NATIONAL COMMISSION FOR GEOGRAPHY. Its expedition made geographical researches in Palestine.

SWEDISH. Mjöberg, ethnology, Central Borneo. Nepon and Salac, Czecho-Slovakians, unearthed the ancient Greek city, Kyme, Palestine. In Europe the few results were archæological. Philadelphus made important discoveries in excavations in Athens. The *Swedish Archeological Society*: Pershon and Frodin continued researches in the ruins of Asine, Peloponnesus. RUSSIA. Miss Misonova discovered ruins of prehistoric city, Postnikova, near Samara. ITALY. *Institut de Paléontologie:* Vaufrey, archeology, prehistoric Sicily.

NORTH AMERICA. CANADA. The various departments of the Canadian Government continued their researches of the resources of the north-land—fisheries, forests, game and minerals. The primitive races were protected by inspections of the stations of the police, among which is that on Panguirtung fiord, Baffin Land. For wandering Eskimos a post was established on Bache Peninsula, Ellesmere Land, in 79°04'N.; Canadian development has been extended by the purchase, by the Hudson Bay Company, of the trade privileges of the Moravian Church in Labrador.

MEXICO. DEPARTMENT OF ARCHEOLOGY NATIONAL MUSEUM: Its officials, E. J. Palacios and Miguel de Mendidabal, discovered the ruins of a Maya city, near Santa Isabel, Chiapas, built about 1600 years ago.

BRITISH HONDURAS. The *British Museum*, by its agents made excavations of the ancient Maya city of Lubaantun, in Southern British Honduras.

SOUTH AMERICA. Fawcett, ethnology, Brazilian forests. Izquierdo, excavation of buried city in Ecuador. McGovern, archeology, Paracas, Brazil. (See also AMERICAN EXPEDITIONS, ante.)

OCEANS. Germany, through its navy, was exploring the North and South Atlantic, as to its currents and its water, its salinity and temperature.

The Dutch-American expedition, Van Leeuwen and Stirling, made by airplane ethnological studies in Dutch New Guinea.

**EXPOSITIONS.** The great event of the year was the Sesqui-Centennial Exposition held in Philadelphia, Pa., from June 1 to December 1 in commemoration of the sesqui-centennial anniversary of the signing of the Declaration of Independence in 1776. Its scope was further defined as serving to "demonstrate in graphic manner the progress made in the United States during the past fifty years in education, art, science and industry, in trade and commerce, and in the development of the products of the air, the soil, the mine, the forest and the seas, and it is the aim and desire that the people of all other nations be invited to contribute evidences of their own progress to the end that better international understanding and more intimate commercial relationships be engendered, and so hasten the coming of universal peace."

**HISTORY.** The story of the inception of the desirability of celebrating the sesqui-centennial of the signing of the Declaration of Independence with an exposition by a group of citizens at a meeting held in November, 1920; its general acceptance, and the almost complete abandonment of the proposition; followed by the revival of the plan under the auspices of the organization that ultimately carried it through has been given in *YEAR BOOKS* for 1921 (p. 217), 1922 (p. 227), 1923 (p. 222), 1924 (p. 229), and 1925 (p. 225).

The following were the principal officers during the life of the Exposition: W. Freeland Kendrick, Mayor of Philadelphia, President; Ernest T. Trigg, Vice President and Chairman Executive Committee; E. J. Lafferty, Vice Chairman Executive Committee; D. C. Collier, Director General (resigned in 1925 and succeeded by Capt. Asher C. Baker, who died on June 5, 1926); E. L. Austin, Comptroller; and George W. B. Hicks Executive Secretary. Subsequent to the death of Captain Baker the responsibility of the exposition was transferred to E. L. Austin, business manager and comptroller.

**LOCATION.** The site selected for the exposition was at the south end of Broad Street about 3 miles from City Hall and easily accessible by means of street car lines, busses, and special vehicles. The grounds proper consisted of 275 acres of League Island Park, beautifully landscaped, with lakes and a wading pool, which were used for the foreign and state section and special buildings and whose use was donated by the city of Philadelphia; adjacent land making up with League Island Park a tract of 450 acres on which were the main buildings and plazas of the exposition; a tract of 120 acres, which it is expected will ultimately become the municipal golf course, was enclosed within the grounds and served as a flying field as well as the city flying field of 90 acres which was a little further to the west; a plot of 300 acres was set aside for auto parking; and 90 acres were reserved for military encampment. Including within this total space of 1050 acres for the exposition, were the 80 acres assigned to the Gladway and the 15 acres of lagoons.

**BUILDINGS.** The main buildings of the exposition were of modern factory type steel frame with stucco coating. The "set-back" style of treatment of the larger structures was both novel and unique with this exposition. The palaces were decorated in pastel shades laid in stucco,

thus making their optical effect soft and pleasing. The general result was similar to that of the vari-tinted buildings of the tropics and led to the name of "Rainbow City" being applied to the Sesqui-Centennial in the same way as "White City" was given to the World's Fair held in Chicago in 1893. The supervising architect under whose direction the various buildings were erected was John Molitor. The two great exposition structures in which most of the exhibits were housed were the Palace of Liberal Arts and Manufactures and the Palace of Agriculture and Food Products, each of which had a floor space of 338,992 square feet or 8.35 acres and cost \$1,250,000. In addition to these were the Palace of Machinery, Transportation, Mines and Metallurgy with a floor area of 489,456 square feet or 11.3 acres, that cost over \$750,000; the Palace of Education with an area of 108,992 square feet that cost \$350,000; an Auditorium in which concerts were given by famous orchestras and bands and conventions held, and for which an organ was built that cost over \$150,000; and a great Stadium that cost \$3,000,000, and had a seating capacity for 100,000 persons, and possessed an equipment of every facility for staging outdoor contests and pageants whose proportions demanded more than the average size athletic field. A valuable collection of pictures, more than a thousand in number, was brought together from various parts of the world and was housed in a building devoted to Fine Arts. See *ARCHITECTURE*.

Other buildings included those erected by the States of Connecticut, Delaware, Florida, Illinois, New Jersey, New York (a replica of the Federal Building in which George Washington took the oath of office), Ohio, Pennsylvania (which cost \$450,000), and others of less importance. Among the buildings erected by foreign nations were those of Argentina, Czechoslovakia, India (which simulated the Taj Mahal and contained the exhibits shown at Wembley), Persia, Spain, and Sweden.

There was also a reproduction of High (now Market Street), in Philadelphia during 1776, showing the life of that time and including private residences, a market, a meeting house, a printery, various shops, a theatre, an inn, a school and other institutions which served to contrast conditions of 150 years ago with those of to-day. The Colonial Dames of America built a replica of Sulgrave Manor, the ancestral home of the Washington family in England, in which were exhibited historical relics pertaining to the life of the Washingtons. See *ARCHITECTURE*.

**SPECIAL FEATURES.** Among the special features to be noted was a gigantic Liberty Bell, the height of a six-story building, which stood at the Plaza entrance to the grounds and contained 26,000 incandescent lights.

At the head of the Court of Honor between the Palace of Liberal Arts and that of Agriculture stood the imposing Tower of Light, over 200 feet high and surmounted by the Light of Independence (never completed). This tower was visible from all parts of Philadelphia and the surrounding territory, and at night when it was illuminated its great silver shaft shed a radiance over the entire exposition grounds.

In the court below, the Forum of the Founders, stood eight-foot portrait statues of the signers of the Declaration. These statues extended around the entire court, and, from the standpoint of

*Wide World Photos*

THE ILLUMINATED LIBERTY BELL AT THE ENTRANCE TO THE GROUNDS

THE AVENUE OF THE COLONIES

THE SESQUI-CENTENNIAL EXPOSITION AT PHILADELPHIA

American culture, were of much value as an educational feature. In the centre of the Forum stood an excellent group of sculpture representing Philadelphia driving forward under the progressive inspiration of 1776. Near this group began the Stairway of Nations as it led downward into the Grand Plaza where stood two heroic figures, the lions of Courage and Peace. Other decorative groups formed an important part of the Stairway, also various groups of statues and other pleasing architectural features contributed to the beauty of the grounds.

**OPENING EXERCISES.** These occurred on May 31, when amid salvos of artillery, the hum of air squadrons, and great choruses, the Sesqui-Centennial Exposition, celebrating the 150th anniversary of the signing of the Declaration of Independence, was formally opened by Mayor Kendrick. The exercises took place in the stadium where addresses were made by Secretary of State Kellogg and Secretary of Commerce Hoover. It was estimated that 100,000 persons visited the grounds on this occasion but owing to the inclement weather not more than half that number were present when the addresses were delivered.

**SPECIAL DAYS.** Throughout the life of the Exposition nearly every day bore some special designation and was celebrated accordingly. More than 200 organizations gathered in Philadelphia for their meetings and visited the fair. Perhaps the most conspicuous event was on July 4, when President Coolidge visited the exposition and addressed a large audience from the Stadium. Of this address it was said that it was "the most notable speech on a patriotic theme he has made during his administration." He discussed the spirit that animated the framers of the Declaration of Independence, contending that the chief credit for that immortal document was due to the preachers of Colonial New England, such as Thomas Hooker and John Wise. Jefferson originated no principles but merely gave expression to ideas penetrating the south from New England and taking form there in George Mason's Declaration of Rights. He appealed to the Nation to rededicate itself to the faith of the fathers as expressed in the Declaration of Independence, and asserted, touching upon the lack of law enforcement, that "it is not the enactment but the observance of laws that creates the character of a nation."

An event of unusual interest was the celebration on October 3 of a solemn pontifical mass of thanksgiving for 150 years of American independence, participated in by more than 250,000 Catholics. Preceding the mass, which was celebrated by Cardinal Dougherty, approximately 50,000 Catholic men representing religious organizations, such as the Knights of Columbus and similar bodies, marched down Broad Street from the centre of the city to the stadium.

**RESULTS.** According to the *Philadelphia Public Ledger* of Dec. 1, "Financially the Sesqui failed. Its attendance was an amazing disappointment, but artistically and educationally it was a striking success. There have been few greater international expositions than this in all the history of expositions. Yet it was smothered under indifference, jealousy, and prejudice and was never able to overcome the handicaps of bad weather and hard-driven haste." According to Mayor Kendrick the attendance was less than one-third what the Exposition Association had expected. Total paid admissions from the open-

ing of the fair on May 31 up to November 25, aggregated 4,536,617 and admissions of all kinds, including passes, totaled 5,852,483. It had been estimated that at least 15,000,000 paid admissions would be had. An international jury of awards, including specialists in various branches of industry and representatives of foreign interests, examined the many exhibits and distributed awards of merit as follows: Grand prizes; gold, silver, and bronze medals; and honorable mentions, none of which was delivered before the close of the year. This work was under the immediate supervision of Mr. S. C. Simms, secretary of the executive jury of awards.

**COMMEMORATIVE FEATURES.** The Post Office Department issued a commemorative two-cent adhesive postage stamp, the central design of which is "the Liberty Bell which swings from the top of four flat ornamental columns that rest on the lower panel." Later on envelope stamp was issued on which again the central design was "an embossed Liberty Bell partly surrounded by a wreath with the years 1776 and 1926 on either side." The Post Office Department also inaugurated on July 6 a daily air mail service between Philadelphia and Washington as an adjunct to the Sesqui-Centennial exposition. In compliance with the Act of Congress authorizing Government participation in the Exposition, the Treasury Department made two commemorative coins, one in silver of 50 cents and one in gold of \$2.50, both of which were sold at a premium. The 50 cent coin had busts of Washington and Coolidge on the obverse and the Liberty Bell on the reverse. The \$2.50 coin showed a draped female figure of Liberty, standing upon a globe with a lighted torch in her left hand while on the reverse was a view of Independence Hall.

The inception of a proposition to determine if visions of a great exposition to be held in Chicago, "far surpassing that of 1893," could be successfully carried out, was originated on March 31 when in response to a call by Mayor Dever a committee of 150 citizens met as a civic centennial committee and decided favorably on the general proposition. Later a ways and means committee of 35 citizens considered the two centennial years of 1933, the 100th anniversary of incorporation of Chicago as a village, and 1937, the anniversary of incorporation as a city, and decided in favor of the former. On June 4, the task of planning the proposed 1933 centennial exposition as a celebration of Chicago's one hundredth birthday was assigned to a committee of seven citizens, as follows: D. F. Kelly, Edward J. Kelly, President of the South Park Board; Alexander H. Revell, E. N. Hurley, Melvin A. Traylor, A. D. Lasker and Dr. Otto L. Schmidt, President of the Chicago Historical Society, who were appointed by the Mayor. A few days later, Edward N. Hurley, former chairman of the United States Shipping Board and war-time head of the Emergency Fleet Corporation, was elected permanent chairman of the Chicago centennial exposition.

It was announced in February that the inauguration of the Ibero-American Exposition at Seville, Spain, had been postponed indefinitely as two more years would be needed to complete the plans. Of 23 nations invited to exhibit, only the United States, Mexico, and Argentina definitely accepted. Four declined. Sixteen accepted, but gave no evidence of intention to attend. The American pavilion was to be erected on the

grounds of the classical Vente de Eritana site, where during many years classical art, dance, and song festivals were held.

A Pan-Pacific Exposition was announced by Japan to be held in Nagoya during 1929. The plans call for an expenditure of 10,600,000 yen of which 3,000,000 yen will be contributed by the city and province of Nagoya. Halls of industry, art, agriculture, stock, forestry, maritime products, minerals, machinery, electrical apparatus, communications, social service, and social culture are to be erected. The buildings, including the projected City Hall, which will be used for the offices of the exposition, will cover nearly 25 acres. Between 6 and 7 acres of space will be allotted to foreign exhibits from the shores of the Pacific, and the exhibits of Japanese products will occupy the remaining space. About 240 acres will be set aside for the exposition grounds which will be located in four different districts. Several of the buildings are to be permanent and the others will be constructed in such a manner as to be easily converted into warehouses or factories.

Among the usual trade fairs may be mentioned the British Industries Fair, which was held in London and Birmingham during February 15-26. The participation of Canada and the East African colonies was reported. The usual spring fair was held in Lyons, France, during March 1-14. The number of exhibits was about 3000 as compared with 2800 in 1925. The orders placed with exhibitors were greater by 50 per cent than last year. The spring fair held in Leipzig, Germany, during February 28-March 6, opened with 11,000 exhibits. More than 100,000 buyers from all over the world, 400 of them Americans, visited the fair. A mammoth "Hindenburg Boot"—17 feet high, with a sole 9 feet long, and sewn with clothesline—was one of the unusual exhibits. The boot weighed 300 pounds, and represented the labor of six men for 750 hours. The fall fair in Leipzig was disappointing. It was reported that there were 8500 exhibitors and approximately 50,000 visitors. There were very few foreign buyers, sales being confined chiefly to German retailers who were replenishing stocks and placing Christmas orders. Most of the exhibitors readily extended credits to buyers, with a minimum of 60 to 90 days and special inducements offered for earlier payments.

**EXTENSION SERVICE.** U. S. DEPARTMENT OF AGRICULTURE. See AGRICULTURAL EXTENSION WORK.

**EXTRADITION.** See INTERNATIONAL LAW.

**FAILURES.** See FINANCIAL REVIEW.

**FAIRS.** See EXPOSITIONS.

**FALKLAND ISLANDS.** A colony of the British crown, situated in the south Atlantic, 300 miles east of Magellan Strait, consisting of East Falkland, 2580 square miles, and West Falkland, 2038 square miles; including in each case various adjacent small islands, about 100 in number. In addition to these are South Georgia with an estimated area of 1000 square miles, and other dependencies, including the South Shetlands, the South Orkneys, the Sandwich group, and Graham's Land, together with all unknown seas and lands of the Antarctic Ocean extending as far as the South Pole. The estimated population in 1924 was 2197. In 1924 the birth rate was 24.12 per thousand and the death rate, 11.18. The chief town is Stanley, with

890 inhabitants in 1921. Education is compulsory. Sheep raising is the chief industry, although whaling is carried on with some success. In 1924 the imports were valued at £475,341 and the exports at £2,585,848. The chief imports were groceries, coal and coke, hardware and machinery; the chief exports, wool and whale produce. The revenue in 1924 was £160,594 and the expenditure, £61,478. Governor in 1926, Sir J. Middleton.

**FAR EASTERN REPUBLIC.** An independent state formed after the war out of the former Russian provinces of Transbaikal, Amur, the Maritime Provinces, and the northern part of the island of Sakhalin. After Nov. 10, 1922, the Far Eastern Republic became a constituent part of the Union of Soviet Socialist Republics, and is now known officially as the Far Eastern region. Area, 652,740 square miles; population, about 2,000,000. Chita is the seat of the government.

**FARROW, EDWARD SAMUEL.** American soldier, engineer, and author, died at New York, N. Y., September 9. He was born at Snow Hill, Md., April 20, 1855, and after graduating from the Baltimore City College with the degree of A. B. in 1872, went to the United States Military Academy from which he was graduated four years later, being commissioned second lieutenant in the Twenty-first U. S. Infantry. June 15, 1876. He was promoted to first lieutenant, Sept. 17, 1883. He was instructor in tactics at the Military Academy from 1880-85, and resigned from the army Feb. 24, 1892. In the course of his military service he participated in movements against the Indians in Oregon, Montana, Dakota, and Washington Territory. Lieutenant Farrow was the founder of the Farrow Public Library, Pinewald, N. J., and of the Pinewald Military Camp of Instruction. He compiled *Farrow's Military Encyclopædia* (three volumes) (1885), and was the author of a number of works on military science, including: *American Small Arms* (1904); *West Point and the Military Academy* (1900); *Camping on the Trail* (1902); *Dictionary of Military Terms* (1917); *Farrow's Manual of Military Training* (1919); *Riots and Riot Duty* (1919); *Gas Warfare* (1919); *American Guns in the War with Germany* (1919).

**FEDERAL AID ROADS.** See ROADS AND PAVEMENTS.

**FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA.** An organization established in 1908 by 28 Protestant denominations, to act for them in matters of common interest. At the end of 1926 it included most of the Protestant denominations of the United States, as follows: Baptist Churches, North; National Baptist Convention; Free Baptist Churches; Christian Church; Churches of God in North America (General Eldership); Congregational Churches; Disciples of Christ; Evangelical Church; Evangelical Synod of North America; Friends; Methodist Episcopal Church; Methodist Episco-

pal Church, South; African Methodist Episcopal Church; African Methodist Episcopal Zion Church; Colored Methodist Episcopal Church in America; Methodist Protestant Church; Moravian Church; Presbyterian Church in the United States of America; Presbyterian Church in the United States (South); Primitive Methodist Church; National Council of the Protestant Episcopal Church; Reformed Church in America; Reformed Church in the United States; Reformed Episcopal Church; Seventh-Day Baptist Churches; United Brethren Church; United Presbyterian Church; United Lutheran Church (Consultative Body). Of these, all were full and official members with the exception of the United Lutheran Church, whose relationship was consultative, and the Protestant Episcopal Church, whose National Council coöperates in certain specified areas of work. The total number of local churches included in the constituency of the Federal Council was 154,816; number of clergymen, 127,781; total communicant membership, 23,540,954.

The Council, made up of members designated by the several denominations to act for them, meets quadrennially, the last meeting having been held at Atlanta, Dec. 3-9, 1924. It has an executive committee of about 100, meeting annually. In 1926 this committee met in Minneapolis, Minn., December 8-10. An administrative committee, including one official representative from each of the denominations, meets monthly in New York. This committee includes representatives of other coöperative agencies carrying on specialized work for the churches, among them being the Home Missions Council; the Council of Women for Home Missions; the Council of Church Boards of Education; the American Bible Society; the Student Volunteer Movement for Foreign Missions; and the International Council of Religious Education. The Council also serves as a connecting link between the church and great social agencies, such as the American Red Cross, the Child Welfare Movement, and the United States Public Health Service.

Special tasks of the Council are carried on by a group of commissions. The Commission on Evangelism develops a united approach to the evangelistic work of the churches. The Commission on the Church and Social Service is the centre through which the churches deal unitedly with social issues. It gives particular attention to the developing of better relations in industry through conferences. The Department of Research and Education issues a weekly information service discussing contemporary social questions from the standpoint of Christianity and makes special studies from time to time, its outstanding study in 1926 being a *Report on the Western Maryland Railway Strike*. The Commission on Church and Race Relations furthers efforts of churches in promoting coöperation and good will between the white and negro races in the United States. The Commission on International Justice and Good Will endeavors to mobilize the Christian forces to abolish war by building up effective international agencies for coöperation. During 1926 attention was given to developing better relations with the Orient. Other Commissions of the Council deal with the following subjects: Christian Education; Relations with Religious Bodies in Europe; Religious Work in the Canal Zone; Army and

Navy Chaplains; Relations with the Eastern Churches.

The programme of the Council is carried on with funds contributed in part by individuals interested in the work and in part by appropriations from the various denominations. The official organ of the Council is the *Federal Council Bulletin*, issued monthly and furnishing general religious news. The officers, 1924-28, were: President, Rev. S. Parkes Cadman of Brooklyn, N. Y.; Chairman of Executive Committee, Bishop John M. Moore of Dallas; Chairman of Washington Committee, Bishop William F. McDowell; Chairman of Western Committee, Dean Shailer Mathews. National offices are at 105 East 22d Street, New York. There is a Washington office in the Woodward Building, and a Western office at 77 West Washington Street, Chicago. General Secretaries at the national offices are Rev. Charles S. Macfarland, Rev. John M. Moore, and Rev. Samuel McCrea Cavert.

**FEDERAL RESERVE BANK.** See FINANCIAL REVIEW.

**FEDERAL TERRITORY.** A territory of the Commonwealth of Australia, lying within the state of New South Wales. Area, 940 square miles; population, according to the census of 1921, 2572; estimated June 30, 1925, 4455. The bulk of the territory was acquired by the Commonwealth from New South Wales in 1911, as the site of the new capital, Canberra; 28 additional miles were obtained in 1917 as the site for a naval college.

**FEDERATED MALAY STATES.** A group of states, constituting a large part of the Malay Peninsula, under the protection of Great Britain, comprising: Perak, with an area of 7800 square miles; population in 1921, 590,055; capital, Taiping; Selangor, 3156 square miles; population, 1921, 401,009; capital, Kuala Lumpur, the largest city in the federation with a population of 80,000; Negri Sembilan, 2550 square miles; population, 1921, 178,762; capital, Seremban; Pahang, 14,000 square miles; population, 1921, 146,064; capital, Kuala Lipis. The total area is 27,506 square miles; with a population in 1921, of 1,324,890, comprising 510,821 Malays, 494,548 Chinese, 305,219 natives of India, 5686 Europeans, and 3204 Eurasians. The males greatly outnumber the females (853,528 to 471,362), which is due to the large number of Chinese and Indian immigrants. The estimated population in June, 1924, was 1,418,455. The movement of population in the same year was: Births, 39,512; deaths, 33,585. In 1924 there were 44 English schools, with an average enrollment of 10,254 boys and 2500 girls. Vernacular schools under the control of the education department numbered 640 with an average enrollment of 34,501. There are many vernacular schools for the Chinese not maintained by the government.

The chief products include: Rice, coconuts, rubber, sugar, tapioca, pepper, gambier, and nipa palms. The main industries are the raising of rubber and the mining of tin. In addition to valuable timber, the forests produce resins, canes, gutta percha, etc. Besides tin, gold is mined extensively; other minerals found but not worked in quantities are lead, iron, copper, manganese, silver, zinc, plumbago, mercury, arsenic, and scheelite. In 1925, 45,925 tons of tin were exported. At the end of 1924 the number of persons engaged in the mining indus-

try was 100,479. According to the United States Bureau of Foreign and Domestic Commerce the foreign trade of British Malaya in 1925 exceeded that of any previous year in its history. Exports of \$715,818,000 and imports of \$540,760,000 netted a credit balance of trade amounting to \$175,058,000. These figures compare most favorably with those for the trade of 1924, when exports amounted to \$369,793,000 and imports to \$340,013,000.

Throughout the year the great impetus to the unprecedented trade advance was the rubber situation. In the first quarter rubber prices were higher than at any time during the previous year, and levels that were much higher were reached in the third and last quarters. Gross exports totaled over 300,000 long tons for the year. Of this amount approximately 73 per cent was shipped to the United States, 22 per cent to Europe and 3 per cent to Japan. High prices for tin were also maintained throughout the year. The total trade with the United States reached the unprecedented total of \$325,162,000, of which \$313,941,000 represented imports into the United States and \$11,221,000 exports from the United States.

In 1924 the revenue of the states was £8,250,131 and the expenditure, £6,162,983. The public debt of Dec. 31, 1924, was £11,105,000. The total railway mileage open for traffic in 1924 was 1072 miles. The Federated Malay States railways enjoyed a successful year financially during 1925, according to the annual report of the general manager and chief engineer. The period which the report covers was one of great prosperity in the tin and rubber industries, the most important in British Malaya. This prosperity was reflected in the increased railway tonnages and receipts, the latter from all sources totaling £2,186,724; an increase of 15.63 per cent over 1924. Passenger receipts showed increase of 16.41 per cent over 1924, and amounted to £790,522. The railways carried 1,786,000 more passengers than in 1924, the greatest number since the "boom" year of 1920.

The states are under British protection and the British government is represented by the governor of the Straits Settlements who is *ex officio* high commissioner for the Federated Malay States. High Commissioner in 1926, Sir Lawrence Nunn Guillemard.

#### FEDERATION OF LABOR, AMERICAN.

See LABOR, AMERICAN FEDERATION OF.

#### FEHRENBACH, fär'en-bäig, CONSTANTIN.

Former chancellor of the post-war German Reich, and a leader of the Centre political party, died at Berlin, March 26. He was born at Freiburg in 1852, and in 1903 was sent to the Reichstag by the Centre Party of Baden. He was selected by his party at the time of the Zabern incident, for his knowledge of Alsace and its people, to represent it in the debate on the vote of no confidence against Von Bethmann Hollweg. In this speech, he spoke against the methods of the Prussian army in Alsace and achieved a reputation which continued through his life. After the election of June, 1920, at the invitation of President Ebert, he formed a cabinet composed of representatives of the Centre, Democrats, and People's parties with Dr. Simons as foreign minister and Dr. Wirth as finance minister. It was during this ministry that the great reparation struggle was begun, and the German delegation to the Spa Con-

ference, the first time the Germans had met with their former enemies since Versailles, was headed by Herr Fehrenbach. He participated in the various financial conferences which followed, serving until May 4, 1921, when he resigned, and a new Cabinet was formed by his finance minister and fellow citizen in Freiburg, Dr. Wirth.

**FENCING.** The international match between United States and British teams for the Robert M. Thompson Trophy was the outstanding feature of the fencing activities during 1926. The final score of the contest was 27 to 21 in favor of the Americans. Leo Nunes of the New York A. C. made the best showing in the United States national championships, taking the sabre, epee and three-weapon honors. The Fencers' Club of New York again proved to be the leader in team title tests, winning the foils, epee and three-weapon contests. The sabre crown was won by the New York A. C. Mrs. Leon Schoonmaker of New York City successfully defended her women's national foils championship.

In the annual intercollegiate title tournament Yale emerged victorious with a clean sweep of the events. Two midshipmen from the United States Naval Academy captured individual titles, Eskilson winning with the sabre and Bennett with the epee. Joseph Levis of the Massachusetts Institute of Technology won the foils championship. In the annual Oxford-Cambridge series, Oxford triumphed with the epee and Cambridge with the foils, while the sabres were halved.

**FENNER, BURT LESLIE.** American architect, died at New York, January 25. He was born at Rochester, N. Y., Sept. 5, 1869, and after studying at the University of Rochester attended the Massachusetts Institute of Technology from 1890-91. In 1891 he entered the office of McKim, Mead & White in New York and was admitted to that firm Jan. 1, 1906, a connection he maintained until his death. Among the buildings designed by that firm in which Fenner had an important part were the New York City Municipal Building, the Post Office Building, Bellevue Hospital, Columbia University buildings, Metropolitan Museum of Art, the J. P. Morgan Library building, the Pennsylvania Railroad Station, and the Hotel Pennsylvania. During the World War he was general manager of the United States Housing Corporation of the United States Department of Labor.

**FERGUSON, FRANK WILLIAM.** American architect, died at Boston, Mass., October 4. He was born at Portsmouth, N. H., Nov. 3, 1861, and studied in the class of 1887 in the scientific department of Dartmouth College. Practicing architecture in Boston, he became associated with Ralph Adams Cram under the firm name of Cram & Ferguson. This firm were the architects of the new buildings of the United States Military Academy, West Point, St. Thomas' Church, N. Y., the Cathedral of St. John the Divine, N. Y., Rice Institute of Texas, and buildings for Princeton University, Williams College, Richmond College, and other educational institutions, as well as consulting architects of St. Alban's Cathedral of Washington, D. C. Ferguson was a member of the American Institute of Architects, and of the Boston Society of Architects.

**FERNALD, BERT MANFRED.** United States Senator from Maine, died at West Poland, Me., August 23. He was born at West Poland, Me.,

April 3, 1858, and after attending the public schools, Hebron Academy, and Boston business and preparatory schools, entered business. In 1888 he established a sweet corn canning factory at Poland, an enterprise that gradually extended until at the time of Senator Fernald's death, the concern was operating huge canneries at Poland, Oxford, Cornish, Bryant Pond, Turner, and Lisbon, employing 1000 persons, and packing some 25,000 cans of corn a day. Senator Fernald was a director of the Fidelity Trust Company of Portland, of the Poland Dairy Company, and President of the Poland Telegraph Company. He was a member of the executive committee of the National Canners' Association in 1910. He served as superintendent of schools of Poland, and in 1897 was elected to the lower house of the Maine Legislature. In 1899-1901 he was state senator, and in 1908 he was elected as governor and reelected in 1910. During his administration the new state house at Augusta was built and various state commissions were created to preserve the forest and water supplies of the State.

In 1916 on the death of Edwin C. Burleigh he was elected to the United States Senate for the unexpired term 1916-19, and in 1918 was reelected for the full term. In 1924 he won the nomination in a contest with Representative Frank E. Guernsey, and was reelected by a large majority in a campaign where the Ku Klux Klan issue was raised by the Democratic candidate for governor, W. R. Pattengall. In the Senate Mr. Fernald was an active and useful member, serving on several important committees. He was the author of the bill for building the great memorial bridge across the Potomac from the Lincoln Monument to the old home of General Lee, and advocated the appropriation of \$17,000,000 for additional hospital accommodations for soldiers. He opposed the bills introduced to provide government regulation of the packing industry, and while listed as a regular Republican he frequently voted against a majority of his party. He was opposed to the World Court and against the soldiers' bonus, but in January, 1925, voted to uphold the President. He was an advocate of the public buildings programme introduced by Secretary Mellon providing large appropriations for the District of Columbia and the nation at large, serving as the chairman of the Committee on Public Buildings and Grounds. He also was a member of the committees on Interstate Commerce and Pensions, and was considered a pleasing and forceful speaker.

**FERTILIZERS.** At the end of 1926 it was estimated that the world used \$300,000,000 worth of fertilizers annually. With increase of population and food needs of the world, more intensive farming requiring greater use of fertilizers is inevitable. A recent writer in *Nature* says "there is big business in fertilizers to-day, there will be bigger business to-morrow; and no progressive country will be able to afford to neglect provision of these basic raw materials of food production."

Fortunately, recent investigation has tended to show that, if applied with proper care, fertilizers can be used in large amounts not only with profit but without injury to the soil. Truck growers of Florida use high-grade fertilizers at rates of 2000 to 4000 pounds per acre, and fertilizers are used at even higher rates for cer-

tain purposes in California and other States. The per acre consumption in the United States is, however, much lower than in Holland, Germany, Belgium, and some other countries, and there appears to be no doubt that even in the high consuming countries the use of fertilizers might be materially increased with profit.

The present trend is strongly toward the increased use of more concentrated fertilizers. The fertilizer industry, founded primarily to salvage certain waste products, is becoming a great chemical manufacturing industry. The campaign of the U. S. Department of Agriculture, the agricultural experiment stations, and the fertilizer manufacturers for more concentrated high-grade fertilizers is beginning to show marked results. Ordinary fertilizers on the market have a content of 15 to 16 per cent of actual plant food, representing an increase of 15 to 20 per cent in plant food in the last 5 years, and resulting in a marked decrease in the number of brands. The manufacture of highly concentrated fertilizer materials is increasing, and such fertilizers are beginning to appear on the market in considerable quantity. Their practical value and best methods of distribution were being extensively studied. It had been demonstrated that concentration did not diminish the efficiency of the fertilizers and that mechanical and other difficulties of distribution could be overcome by comparatively simple means. The importance of concentration was emphasized by the fact that probably 25 per cent of the cost of fertilizers was for transportation.

Lawrence Myers, of the University of Minnesota, concludes from a study of the index of wholesale prices of commodities prepared by the Department of Labor that "with the exception of the war period, the trend of fertilizer prices has been downward since 1897. From 1922 to the present they have stood at roughly 70 per cent of their 1913 level." He concludes that "fertilizer prices are low enough to lead to large consumption," but points out that "fertilizer price is not the only, or the most important, factor in determining consumption."

The use of fertilizers fluctuates with crop values and farm income and continues to be restricted by low purchasing power of the farmer, notwithstanding the fact that the price is relatively low as compared with other commodities the farmer has to buy. The present outlook indicates that substantial progress in the direction of cheaper fertilizers may be expected from (1) increased and cheaper production of nitrogen compounds from the air, (2) cheaper and more concentrated substitutes for acid phosphate, and (3) abandonment of use of low-grade fertilizing materials.

The rapid development of the synthetic nitrogen industry is certain to have a profound and far-reaching effect upon the fertilizer industry and the use of fertilizers. The estimated production of synthetic nitrogen compounds in 1926 was 600,000 metric tons. Production already had exceeded domestic needs in Germany and bade fair to do so in France and England. The production in the United States was still relatively small. The necessity for finding an outside market for the excess products of the German fixation plants led to an active sales propaganda and the putting on the market of a number of products of the industry. Of the world's consumption of inorganic nitrogen, estimated to be

about 1,500,000 tons, 27 per cent was being supplied by Chilean nitrate, 30 per cent by coke industry by-products, and 43 per cent by fixed air nitrogen compounds.

The synthetic ammonia process was being most largely used in the preparation of fixed nitrogen compounds. The introduction and successful operation of the Claude process in the United States was regarded as the most important development of the year. The combined capacity of the commercial synthetic ammonia plants operation in the United States was considered sufficient to supply all the ammonia needed for refrigeration and the chemical industry, and the conversion of ammonia into urea, a form better suited to agricultural purposes, was receiving attention and was making satisfactory progress. The Fixed Nitrogen Research Laboratory of the Department of Agriculture had in successful operation for a year a process by which ammonia could be economically converted into urea by synthesis with carbon dioxide.

A joint commission of the United States Congress, consisting of three members of the House of Representatives and three of the Senate, appointed to seek and pass upon bids for private operation of the Muscle Shoals plant, recommended acceptance of the bid of the Muscle Shoals Power Distributing Company and the Muscle Shoals Fertilizer Company, on the ground that this was the most satisfactory offer from the standpoint of both national defense and fertilizer production. No action, however, had been taken upon this recommendation at the close of the year. The welfare of the nation in peace, as well as its safety in war, points to the wisdom of so operating this plant as to make the country potentially independent of any outside monopoly for its necessary supply of nitrogen compounds.

There recently was great activity in the production of by-product ammonium sulphate. It was reported that more than 11,700 ammonia recovery ovens were in operation in the United States in 1925 and that 290 more were added in 1926. The total production of ammonium sulphate in the United States was given as 150,000 tons, 40 per cent of which was used as fertilizer. Great Britain was reported to be producing ammonium sulphate at the rate of 430,000 tons annually, of which 238,000 tons is exported.

In view of the increased production of ammonium sulphate, its better use as a fertilizer is receiving unusual attention. It has been found to be especially well suited to alkaline soils and certain kinds of crops, as for example, rice, coffee, and perhaps others, and that its efficiency may be increased by using it in combination with other substances, which neutralize its tendency to increase the acidity of the soil.

The world's consumption of Chilean nitrate was reported to have declined from 2,350,000 long tons in 1925 to 2,077,000 tons during the year ended June 30, 1926. The consumption in the United States, which had been the chief customer for nitrate, declined 12 per cent. This was accounted for, in part at least, by increased production of ammonium sulphate and synthetic nitrogen compounds. It was believed to be accounted for mainly by high price of the nitrate. A new schedule of prices, put into effect by the Chilean Nitrate Producers' Association, reduced the price of nitrate for 1926-27 about 5 per cent below that of the preceding year and, it was

held, "brings nitrate prices somewhat closer to the general world level of prices for fertilizer nitrogen, but leaves a considerable price differential between nitrate nitrogen and nitrogen in ammonium sulphate." A new and improved refrigeration process of removing the nitrate from solution is being put into operation and is expected to increase the efficiency and reduce the cost of extraction of nitrate. The question of reducing the Chilean government export tax, which has remained at \$11.20 per short ton since it was first imposed 29 years ago, was under discussion.

**POTASH.** The Franco-German potash monopoly continued to control the potash supply and price of the world. Substantially pre-war prices prevailed. Ninety per cent of American imports of potash come from German and French sources. The United States produces only about 10 per cent of the 250,000 tons of potash it uses annually. Further efforts were made during the year to encourage development of domestic production of potash. Congress appropriated \$100,000 annually for the five years 1927 to 1931, inclusive, to enable the Departments of the Interior and Commerce to determine the location, extent, mode of occurrence, and nature of potash deposits in the United States. As a result of explorations by the Geological Survey in Texas, New Mexico, and Utah, potash minerals have been found which indicate the occurrence of American deposits similar to those of Germany and France. The method developed by the U. S. Bureau of Soils for the recovery of potash and the manufacture of certain valuable by-products from greensand was further elaborated. This offers a possible means of profitable utilization of the greensand of New Jersey and other Atlantic States, which is the largest known source of potash in this country. The discovery of large deposits of potash salts in the western part of the Government of Perm, Russia, was reported during the year.

The phosphate situation during the year was one of relative stability, except that there was noteworthy progress in the development of the Moroccan phosphates, which are coming into sharp competition with American phosphates in the European and South African markets.

**SUMMARY.** The fertilizer situation at the end of 1926 was in brief as follows: With the exception of nitrogen, the raw materials for the manufacture of fertilizers are abundant. There seems to be almost no limit to the possible production of synthetic nitrogen compounds from the air. The production of such compounds is rapidly developing and is already important. Production of ammonium sulphate is running ahead of the demands for it in the fertilizer industry. The present known sources of potash are large, and additional sources are being sought with promise of success. Phosphate production is adequate and is being increased, especially by development of the North African deposits.

**BIBLIOGRAPHY.** Two important books relating to fertilizers appearing during the year were: *Potash*, by J. W. Turrentine (New York, 1926); and *Fertilizers*, by E. B. Voorhees, revised by S. B. Haskell (New York, 1926).

**FIJI ISLANDS.** A British crown colony, comprising a group of islands in the South Pacific about 250 in number (some 80 inhabited). Area, 7083 square miles; population at the census of 1921, 157,266, of whom 84,475 were Fijians, 60,634 Indians, and 3878 Europeans. The largest island is Viti Levu (4053 square miles) and the next Vanua Levu (2130 square miles). The capital, Suva, on the south coast of Viti Levu, had a European population (including suburbs) of 1741. Coconuts, sugar cane, rice, tobacco, tea, tropical fruits, beans, sisal, and hemp are the principal products. Horses, mules, cattle, sheep, goats, and pigs are raised. No later figures for trade are available than those given in the preceding YEAR BOOK when the exports in 1924 were valued at £1,498,934 and the imports were £1,066,594. Imports from the United Kingdom in 1925 totaled £289,613 and exports to the United Kingdom were £568,708. The revenue in 1924 was £488,906; expenditure, £451,257; public debt, £359,200. The total tonnage which entered and cleared in 1924 was 799,214 tons of which 690,076 were British. A privately owned small gauge railway of 120 miles runs from Tavua to Sigatoka. The executive power is vested in a governor, appointed by the crown, aided by an executive council and a legislative council of which the governor is president. The governor is also High Commissioner for the Western Pacific. Governor in 1926, Sir Eyre Hutson.

**FINANCIAL REVIEW.** Unusual prosperity prevailed during the year 1926 throughout the United States and statistics showed that nearly every kind of product, both of raw and manufactured articles, attained an uncommonly high output. Trade and industry were fully financed, and foreign trade was highly prosperous. Two main periods or divisions in the year's operations may be noted, the first covering the months prior to May, the second the months from May onward to near the close of the year. Apparently a third period had set in soon after the beginning of December. During the first four months, business was in a somewhat uncertain condition, with hesitation as to forward orders and some doubt as to financial conditions. This doubt culminated in a sharp reaction of the stock market during the early spring, which carried prices decisively downward. It did not develop into any general financial depression, for the reason that conditions abroad shortly brought about a very unusual demand for American goods, for export, while at home the building boom, which had been expected to decline, maintained itself—the combined result being a very high level of demand. This, instead of receding during the mid-summer months, as is often the case, continued in full volume and reached record proportions in the early autumn. In many parts of the country, the activity of business led to a decline in failures, and for the country as a whole, failures were less in value than for 1925, showing a decrease of 8 per cent in liabilities. City banking continued prosperous and strong, but the bank failure epidemic which had been developed during the years 1924 and 1925, continued in the middle West and Northwest. Farming was highly productive with very large output both of grain and fruits, while

cotton produced a wholly unprecedented crop. Practically no unemployment prevailed during the year.

**BUSINESS ACTIVITY.** Business indicators for the year made a rather remarkable showing. The accompanying comparative table furnished by the Federal Reserve Bank of New York affords data with respect to some important elements in the situation which are usually regarded as indicative of conditions.

	[Computed trend of past years = 100 per cent]			
	1925	1926

<sup>a</sup> Seasonal variations not allowed for.

<sup>b</sup> Preliminary.

With these factors may well be associated the car loadings situation. Car loadings reached during the autumn, high record figures running well up toward 1,200,000 cars per week for a good while, with a total of about 52,700,000 for the year. The gross operating revenues for Class 1 roads were in the neighborhood of \$6,451,148,000 while net incomes were \$1,231,494,000. Earnings were computed as an average of 5.13 per cent, the net showing an increase over 1925 of \$92,798,000 and the result being a tremendous advance in stock market quotations for the shares of most of the principal lines. See **RAILWAYS.**

Steel and iron activity was satisfactory. The unfilled orders of the United States Steel Corporation showed some fluctuations at different times during the year but held up well, while the manufacturing activity of the concern was good during most of the time. Unfilled orders, as revealed in the final statement of December 10 showed 3,960,969 tons as against 5,033,000 tons a year earlier—an increase also over the month of November of about 150,000 tons. Unusually good orders for railroad building and certain kinds of building construction also marked the close of the year while the end of December found the industry operating at an average of probably of about 75 per cent of capacity. Automobile demand had been expected to fall off but on the contrary was well sustained, although forward orders from that source during the latter part of the year were not as large as they had been expected to be. Activity, however, in other lines and in the oil industry

particularly, produced very good reflex results on steel.

PRICES. For the year 1926 movements of prices were even more stable than during the preceding year notwithstanding that 1925 had itself been a year of rather unusual steadiness. On the whole the tendency was downward, the Bureau of Labor Statistics index being approximately 156 at the beginning of the year and approximately 147 at the closing, the lowest level since July, 1924. Prof. Irving Fisher's index was approximately 159.3 at the beginning of the year and closed at about 146.1. Variations

from the average were slight, the widest fluctuations being in agricultural prices just as had been true the year before. Cotton showed the greatest variations, prices falling very sharply in the late autumn due to an unexpectedly large crop. The agricultural price index of the Bureau of Labor Statistics was 152 for December, 1925 while for December, 1926, it was 135. Textiles and clothing materials were 187 at the end of 1925 and 169 at the end of 1926. Foundry No. 2 pig iron reached a price of \$22.75 per ton at the close of 1926 while No. 2 wheat was \$1.54½. Beef was \$22 per hundred and pork

\$35.50 per hundred at the close of the year. Materials of manufactures were more stable than usual though considerable variations were noted in rubber as well as a few others. Sugar also showed considerable variation in price.

**AGRICULTURAL PRODUCTION.** During the first months of the year, unusual weather conditions with a long cold spring had stimulated the belief that conditions would inevitably be unproductive and that staple crops would consequently show a very low output. Conditions changed sharply toward the beginning of summer, and wheat particularly indicated marked improvement. Cotton had been greatly delayed by the bad weather but now took a fresh start, and owing to the fact that insect pests had apparently been greatly hampered by the long cold spring developed an unexpected volume of output. Comparative figures show the following results for principal crops but the value of cash wheat was as already stated only \$1.54½ at the close of the year while cotton had gone down to 12.60 cents for the January option. Foreign crops had turned out unexpectedly good and the outcome was to drive prices lower all around.

**BANKING.** Banking conditions continued to show expansion and in some directions even inflation. Commercial demand was much heavier than in the preceding year. Speculative loans reached a high record figure at the beginning of the year which was curtailed as the result of sharp losses. After the spring "slump" in the stock market, brokers' loans were cut back to about \$2,600,000,000 but began steadily to climb higher, reaching a point about \$200,000,000 ahead of that figure toward the latter part of the year. The twelve months as a whole therefore proved to be a period of great banking growth. City banks found the year prosperous with large dividends and valuable privileges to stockholders. Nevertheless, in the West and middle West, the epidemic of bank failures which had proved so disastrous the year before continued to manifest itself, the total of failures for the year being in the neighborhood of 940. These failures, moreover, had involved larger institutions than ever before and threatened at certain periods to extend into States which had not been affected by them. The movement of national banks into State systems continued, while the consolidation and merging of small banks with large ones which has been so pronounced of late was a renewed feature of the year. The proposed legislation for the liberalizing of the national bank act continued to be discussed in Congress but without result.

National banking conditions continued to be of the same predominant interest as in preced-

ing years and may be presented in the accompanying statistical statement which shows the general upward movement of all items to which reference has already been made. Continued heavy investment in securities has been characteristic during the year just as during the preceding year.

**THE FEDERAL RESERVE SYSTEM.** The condition of the Federal Reserve System at the close of 1926 is indicated in the accompanying table which shows continued growth in the general operations of reserve banks and a disposition to enlarge the degree of reliance of member banks upon the reserve institutions themselves. While

the foreign operations of the system continued to be important in their psychological effect during 1926 just as during the preceding year, the Secretary of the Treasury announced to Congress at the opening of the winter session that the large credits arranged for Great Britain some months preceding had not been availed of. The major operations of reserve banks, therefore, continued to be of a semi-routine nature following the same lines that had been developed in connection with foreign central banks during 1925. Open market operations continued to attract a good deal of discussion but there was no new policy in this connection, conditions remaining substantially stable.

MONEY RATES. Taking the year 1926 as a whole, money rates continued to be practically stable with comparatively few fluctuations except those of a seasonal nature. Call funds followed very much the same course as during the preceding year with rates substantially parallel to those of 1925. As in the latter year, the closing weeks of the season witnessed a fairly sharp upward movement but the general charge for call money was seldom above 5 to 5½ per cent. The end of the year found call money technically quoted at 5½–6 per cent as against 6 per cent for the close of 1925. Reserve Bank rates were comparatively little altered during the season, a slight advance early in the year putting the figure throughout the system at a flat rate of 4 per cent as against 3½ preceding and this 4 per cent rate was maintained during the remainder of the year. Although constant agitation of the discount rate situation and demand for raising of the rate was frequently heard, it was without result, the condition continuing practically stable throughout the entire Federal Reserve system to the end of December.

Commercial paper showed a hardening tendency for the first part of the year followed by slight recession during the summer and renewed hardening toward the end. The closing figure for the year was 4½–4¾ per cent for prime paper as against 4¼ @ 4½ per cent for a year earlier. Less attractive types of paper were slightly higher at the close of the year but the net rate of return on Treasury certificates was about ½ point lower than it had been at the end of 1925.

During the latter part of the year considerable indication of money strain was apparent, and the fact that brokers' loans had been advanced to a figure of about \$2,800,000,000 was contributory to a feeling of some uncertainty. In ordinary circumstances the reserve rate would probably have been raised but the desire not to disturb the generally prosperous conditions retarded action, while the relationship which had been established between the British and European markets was also instrumental in producing a modification in general reserve policy. However, at the close of the year, it was apparent that the future development of the stock market would depend in no small measure on the policy to be followed by reserve banks with regard to their rates during the early months of the following season.

FOREIGN EXCHANGE. A few outstanding events marked the year as an important one in the foreign exchange field. Conspicuous among them was the fact that the Belgian franc had been placed on a relatively stable basis while very decisive improvement in French and Italian exchange had been developed. The accompanying figures show the outstanding changes that occurred in the major foreign currency quotations during the year. (See Page 264.)

French exchange had reached the lowest recorded level early in July and had been followed by Italian and Belgian quotations, the situation becoming so alarming as to necessitate heroic effort for the establishment of a stable government in France, with some apparent success in that direction. (See FRANCE.) In other countries restoration of the gold standard proved decidedly helpful, the year being, pretty well all through the European world, a year of decided recovery of soundness. Some of the smaller Eu-

Yen	.4908	November 6	.4345	January 2
Milreis	.1587	January 2	.1156	December 16

ropean countries such as Jugo-Slavia, Czecho-Slovakia and Roumania apparently reached a level at which substantial firmness could be reckoned upon while progress was also made in Brazil toward a form of the currency situation designed to put the milreis upon a more stable basis, although at the close of the year the quotation itself was decidedly disorganized due to doubt as to acceptance of the official programme. The disorganization of the trade situation between Poland and Germany resulted in continuous disorder in the Polish currency situation during the first half of the year and although measures of reform were initiated under foreign advice comparatively little success had been gained up to the close of 1926. Japanese yen showed considerably stability, the year closing with the yen only fractionally below par.

**SPECIE MOVEMENTS.** Once again the heavy foreign loans made by the United States helped

to bring about an adjusted international balance and hence to prevent any necessity of shipping specie in considerable amount. The movement of gold and silver is set forth in the accompanying table and from this it is clear that net importations of gold were about \$98,000,000 against a net export last year of \$135,000,000 while the distribution of specie, as shown by official figures between the principal importing and exporting countries, is also presented. The year, however, was without striking changes in the specie situation largely due to the more nearly stabilized position of exchange and international balances.

The chief countries from which the United States imported gold in 1926 and the approximate total sent by each were: Canada \$85,000,000; Chile \$22,000,000; Japan \$16,000,000; Mexico \$21,400,000; and Australia \$30,000,000. Gold was exported chiefly to Canada, \$42,000,000, and Germany, \$46,000,000. Silver was imported chiefly from Mexico, \$36,000,000, and Peru, \$20,000,000, and was shipped to British India, \$35,000,000; China, \$39,000,000; and the United Kingdom, \$12,500,000.

**NEW SECURITIES.** The usual annual compilation of the New York *Journal of Commerce* relating to railroad, industrial and public utility enterprises for the year showed that aggregate sales of these classes of issues amounted to \$3,689,411,000 as against \$3,642,000,000 the year before. This was an increase of about \$47,000,000 over the preceding year. Omitting refunding issues and sales designed to meet maturities, the new capital flotations amounted to \$4,000,000,000 as against \$3,250,000,000. New issues of industrial stocks amounted to \$802,000,000 as against \$1,034,000,000 the year before.

#### EXPORTS AND IMPORTS OF GOLD AND SILVER, 1925-26

Sales of railroad bonds, notes and stocks were \$403,000,000 as against \$474,000,000 the year before. The year was characterized by the raising of capital through issues of subscription rights which in many cases took the place of new financing through sales, the outcome being to raise cash from stockholders rather than from any new buyers. Public utility financing continued heavy throughout the period with holding companies still in a quite conspicuous position.

The new and refunding issues of 1925 and 1926 classified by sources and stated in thousands of dollars as compiled by *The Commercial & Financial Chronicle* of New York, are shown in the table at the foot of the opposite page, 264.

Dividends on industrial shares amounted to \$619,475,000 as compared with \$591,000,000 for 1925. Dividends declared by steam railroads and tractions were \$431,610,000 as compared with \$400,000,000 for 1925.

GOVERNMENT FINANCING. The fiscal year 1926 ending with June 30 showed total ordinary re-

ceipts for the Government amounting to \$3,963,000,000 as against \$3,780,000,000 the year before. Ordinary expenditures amounted to a total of \$3,585,000,000, as against \$3,529,000,000, the amount applied to debt reduction for the year being \$317,000,000. Estimates for the fiscal year 1927 amounted to \$4,027,000,000 while ordinary expenses were estimated at \$3,644,000,000 and debt retirement expenses chargeable against ordinary income \$332,000,000. An unexpected surplus variously estimated at \$300,000,000 to \$400,000,000 made its appearance with the result that further cuts in taxation were promised by President Coolidge and were recommended to Congress at the opening of the short session in December. This, however, proved to be impracticable as an immediate matter from the legislative point of view. Treasury financial policies continued substantially the same with practically no new development. The accompanying tables furnish a complete survey of the income and debt position of the Government at indicated dates.

PRELIMINARY STATEMENT OF THE PUBLIC DEBT DECEMBER 31, 1926  
[On the basis of daily Treasury statements]

*a* Excess of credits (deduct).

*b* Add.

*c* Investments made Jan. 1, 1925, for account of the fund were \$100,000,000 face amount of adjusted service series obligations, of which \$4,600,000 were redeemed to June 30, 1925, to provide funds for authorized payments to that date. Investments made Jan. 1, 1926, and Mar. 5, 1926, in similar obligations were \$120,000,000 face amount from the appropriations available on those dates and \$3,500,000 face amount from annual interest payments on investments. \$38,200,000 face amount of one-year Treasury certificates of indebtedness held in the fund matured Jan. 1, 1926, and after redemption the proceeds of principal were reinvested in like obligations maturing Jan. 1, 1927.

*d* Under provisions of the amendment of July 3, 1926, to the act establishing the civil service retirement and disability fund and regulations issued pursuant thereto, beginning July 1, 1926, expenditures for salary, pay, or compensation of employees entitled to the benefits of the act are at the full amount due. Retirement fund deductions are deposited monthly with the Treasurer for credit to the fund. Amounts not required for authorized payments are invested by the Treasury in special issues of Government obligations bearing interest at the rate of 4 per cent per annum, payable on June 30 each year, which is the same rate prescribed in the act for earnings on the deductions from salary, pay, or compensation. The figures for the fiscal years 1925 and 1926 represent only investments of employees' contributions not required for current expenditures.

**COMPARATIVE PUBLIC DEBT STATEMENT**  
*[On the basis of daily Treasury statements]*

	When war debt was at its peak	Dec. 31, 1925 A year ago	Aug. 31, 1919 Sept. 30, 1926 Last quarter	Nov. 30, 1926 Last month	Dec. 31, 1926
Gross debt . . . . .	\$26,596,701.64	\$20,248,169.68	\$19,472,570.53	\$19,389,019.30	\$19,074,665.37

**BUSINESS FAILURES.** Further development of the situation of the preceding year as regards business failures was the chief characteristic of 1926. The tendency on the whole was toward lower levels particularly in the Eastern part of the country although considerable numbers of failures especially among the banks continued in the West and South. This latter situation was aggravated by the failure of various "chains" of banks at a number of points throughout the country. The following table gives a brief survey of the failure situation in the United States by months:

	Number		Liabilities	
	1926	1925	1926	1925
December . . . . .	2,069	1,878	\$45,619,578	\$36,528,160
November . . . . .	1,830	1,672	32,693,993	35,922,421
October . . . . .	1,763	1,581	33,230,720	29,543,870
4th quarter . . . . .	5,662	5,131	111,544,291	101,994,451
September . . . . .	1,437	1,465	29,989,817	30,687,319
August . . . . .	1,593	1,513	28,129,660	37,158,861
July . . . . .	1,605	1,685	29,680,009	34,505,191
3rd quarter . . . . .	4,635	4,663	87,799,486	102,351,371
June . . . . .	1,708	1,715	29,407,523	36,701,496
May . . . . .	1,730	1,767	33,543,318	37,026,552
April . . . . .	1,957	1,939	38,487,321	37,188,622
2nd quarter . . . . .	5,395	5,451	101,438,162	110,916,670
March . . . . .	1,984	1,859	30,622,547	34,004,731
February . . . . .	1,801	1,793	34,176,348	40,123,017
January . . . . .	2,296	2,317	43,661,444	54,354,032
1st quarter . . . . .	6,081	5,969	108,460,339	128,481,780

**STOCKS AND BONDS.** According to the official figures of the New York Stock Exchange the total number of shares sold on the Exchange for the year was 451,000,000 as compared with 453,000,000 in 1925. The Exchange went through several different phases beginning with a downward movement followed by a definite slump early in the season, this being then succeeded by comparative quiet until early summer, when an almost unprecedented boom set in and was maintained until well into the autumn. This was succeeded by a quieter period with a short lived end of the year "bull market." The par value of bonds sold during 1926 was \$2,988,000,000 as compared with \$3,400,000,000 in 1925. In all, million share days numbered 200 and two million share days 41 while on three occasions more than three million shares were exchanged in the course of a single session. Stock Exchange seats advanced still further during the year reaching a top level of about \$175,000 as against about \$150,000 at the end of 1925. Stock speculation as well as stock buying for investment was on a larger and broader scale than in any preceding year. After the spring slump was over stock prices continued to move steadily forward reaching practically topnotch levels at the close of the autumn. Early in the year just after the spring "slump" the stock index (50 issues),

averaged about 109.63 and this figure was advanced to 142.35 toward the close of December.

General earnings conditions throughout the industrial field continued to be excellent all through 1926, the railroads particularly showing marked improvement in their earnings for the year, as already stated. Probably in no preceding year had there been more extra dividend and stock dividends on the part of all classes of corporations. Bonds reached a high level of value by the middle of the year and held or slightly bettered it during the second half. A combined bond index including rails, industrials and public bonds, indicated a figure of about 89.75 at the close of December as against 85 a year earlier. Increasing volumes of bonds were purchased by financial institutions and the practice already pretty well developed of issuing under the head of bonds what were really common stocks continued to be resorted to although arousing considerable criticism on the part of economists and bankers.

**FINANCING.** See RAILWAYS.

**FINCK, HENRY THEOPHILUS.** A distinguished American musicologist and critic, died at Rumford Falls, Me., October 1. He was born at Bethel, Mo., Sept. 22, 1854. While pursuing his academic studies at Harvard (A.B. 1876), he attended at the same time the courses in theory and history of music of Prof. J. K. Paine. After two years of graduate work there in sociology and psychology he won the Harris Fellowship, which enabled him to spend the next three years in study and research at Berlin, Heidelberg and Vienna. In 1881 he returned to the United States and became musical critic and editorial writer for the *New York Evening Post*, continuing in that position uninterruptedly until his resignation in 1924. He began his career as a writer on musical subjects in 1876, when he was commissioned by the *New York World* to report the first Bayreuth Festival. During his stay in Europe he also wrote accounts of musical activities for *The Nation*. No musical critic in this country exerted a wider or more beneficial influence than Finck. He was a man of profound convictions, possessed of the gift of expressing himself in elegant, forceful and convincing style. At all times he was the champion of progress, and his taste was such that he never espoused an unworthy cause. At the end of his life he had the satisfaction of knowing that public opinion had accepted almost all his judgments as valid. He was one of the earliest, and perhaps the most energetic, protagonist for the new art of Wagner. He was the first one in America to proclaim the true greatness of Chopin, Schumann, Franz and Grieg by emphasizing the fact that genuine musical content, even in the smaller forms, will ultimately triumph over mediocrity parading in the larger forms.

Whatever recognition MacDowell enjoyed during his life was due, next to Carreño's masterly performance of the works, largely to Finck's ardent championship. Liszt, Tchaikovsky and Dvořák also would probably have had less rapid enthusiastic appreciation in the United States, had their genius not found a sympathetic exponent in the writings of Finck. Although at first rather skeptical as to the merit of Richard Strauss, Finck gradually became convinced of that composer's towering greatness. What, in view of such brilliant achievement, will always remain a puzzle is the critic's violent and persistent aversion toward two of the supreme masters, Brahms and Wolf. On the other hand, it seems but natural and logical that the champion of Wagner and Chopin should have been an uncompromising opponent of the atonal and polytonal extravaganzas of the futurists. Finck's principal work is *Wagner and His Art* (2 vols., 1893), which has passed through several editions and was also translated into German. Other important books are: *Chopin and Other Musical Essays* (1899), *Songs and Song Writers* (1900), *Grieg and His Music* (1909), *Massenet and His Operas* (1910), *Richard Strauss: The Man and His Work* (1917), *Musical Progress* (1923). Among several books outside the field of music the more important are: *Romantic Love and Personal Beauty* (1887), *Primitive Love and Love Stories* (1899), *Food and Flavor* (1913). A few weeks after his death appeared his interesting autobiography: *My Adventures in the Golden Age of Music*.

#### FINE ARTS. See PAINTING AND SCULPTURE.

**FINLAND.** An independent republic of Europe; formerly a grand duchy of the Russian Empire; an independent republic since 1917; bounded on the east by Russia, on the north by the Arctic Ocean and Norway, on the west by Sweden and the Gulf of Bothnia, and on the south by the Gulf of Finland. Capital, Helsingfors.

**AREA AND POPULATION.** The total area exclusive of water is 132,642 square miles; population, according to the census of 1920, 3,364,807; estimated Dec. 31, 1924, 3,495,186. In 1924 the rural population made up 83 per cent of the total. The movement of population in the same year was: Births, 78,057; deaths, 53,442; marriages, 22,048; emigration, 5,429, of whom 4775 went to America. The principal towns with their populations in 1924 are: Helsingfors, 207,954; Åbo, 60,412; Tammerfors, 51,035; and Viborg, 46,901. The Evangelical Lutheran religion is that of the national church to which the bulk of the population belongs, but freedom of worship is granted to all.

**EDUCATION.** In 1924 there were for primary instruction 4301 elementary schools, with 230,670 pupils; 1466 lower elementary schools, with 47,145 pupils; and (in 1920) 1407 infant schools under the superintendence of the church, with 170,577 pupils. In the towns there were 1394 classes of higher elementary schools with 43,318 pupils. For secondary education there were in 1924, 108 lycæums, with 2215 teachers and 32,366 pupils; 57 middle schools, with 542 teachers and 8040 pupils; 8 training colleges for school teachers, with 113 teachers and 1400 pupils; and 50 high schools for the people, with 321 teachers and 2423 students. There are three universities: One at Helsingfors with 293 teachers and 3068 students in 1925; two at Åbo;

one Swedish, with 34 teachers and 156 students and one Finnish, with 21 teachers and 154 students. There is also a great variety of agricultural, horticultural, forestry, industrial and other technical schools. In 1920 only 0.7 per cent of the persons who had reached their fifteenth year could neither read nor write.

**PRODUCTION.** The chief occupation of the people of Finland is agriculture. The land under cultivation in 1924 amounted to 5,231,877 acres. The area and production of the principal crops in 1924 were: Rye, 568,482 acres, 282,000 tons; barley, 273,763 acres, 128,000 tons; oats, 1,057,107 acres, 484,000 tons; potatoes, 167,243 acres, 624,000 tons; hay, 2,468,389 acres. The butter production in 1924 was 13,658 tons. The livestock census for 1924 showed 402,963 horses; 864,469 horned cattle; 484,529 sheep; 11,709 goats; 375,681 pigs; and 1,213,282 poultry. The forests are a great source of wealth, Finland being better off in this respect than any country in Europe except Russia. In 1924 there were 3212 large factories, employing 139,429 workers, and yielding an aggregate product of 9,345,000,000 marks. The chief industries are those connected with forest products, paper mills, and textile mills.

**COMMERCE.** The accompanying table from the *Statesman's Year Book* for 1926 shows the principal exports and imports for 1924 and 1925: in Finnish marks:

<i>Imports</i>	<i>1924</i>	<i>1925</i>
Cereals	801,811,851	964,845,088
Colonial produce and spices	684,989,674	881,930,886
Spinning materials	297,872,532	312,544,232
Textiles	550,435,238	580,317,120
Leather, hides, skins	168,460,526	251,839,779
Metals	515,201,834	474,235,940
Machinery	261,546,226	265,167,101
Minerals and earths	227,640,406	207,958,043
<i>Exports</i>	<i>1924</i>	<i>1925</i>
Animals (living)	4,571,155	10,412,865
Food obtained from animals	385,700,946	614,389,303
Timber	2,839,184,973	3,011,961,340
Pulp and paper	1,353,820,440	1,586,851,085
Leather, hides, skins	136,620,124	148,714,512
Minerals and earths	11,224,343	25,640,269
Gums, resins, and tar	12,641,548	15,531,120
Matches, explosives, etc.	44,945,492	34,269,148

According to the United States Bureau of Foreign and Domestic Commerce, exports declared from Finland to the United States showed a general decline as compared with 1924. The total value was \$7,745,365 as compared with \$8,812,560 for the previous year. The greatest decline took place in certain pulp and paper products. A considerable increase occurred in exports of unbleached sulphate wood pulp, as well as in unbleached sulphite.

**FINANCE.** The Finnish budget estimate for 1925 and for 1926 were balanced without resort to loans. The 1926 budget called for reduced direct and increased indirect taxes. The budget continued to be balanced with external assistance, but efforts were being made to reduce the state debt and to increase the reserve fund. The ordinary budget for 1926 showed a somewhat higher estimated surplus and a reduction in the withdrawals for the reserve fund. The state annually devotes considerable sums to various projects that represent an increase in capital investment, and carries on a number of commercial undertakings. The accompanying table gives a summary of Finnish budgets:

**SUMMARY OF FINNISH BUDGETS**  
[In million Finnish marks, paper]

Classification	1924 (actual)	1925 (estimated)	1926 (estimated)
<b>Expenditures</b>			
Ordinary .....	2,530.3	2,784.6	2,843.6
Extraordinary .....	605.2	* 625.7	* 569.5
Transfer to funds .....	.....	.....	.....
Outside of budget .....	13.9	.....	.....
<b>Total .....</b>	<b>3,149.4</b>	<b>3,360.3</b>	<b>3,413.1</b>
<b>Revenues</b>			
Ordinary .....	3,158.2	* 3,131.0	* 3,337.0
Extraordinary proper .....	1.7	0.5	1.0
Extraordinary outside of budget (transfers from State reserve fund) ....	57.1	228.8	75.1
<b>Total revenues proper ..</b>	<b>3,217.0</b>	<b>3,360.3</b>	<b>3,413.1</b>
Loans .....	.....	.....	.....
<b>Grand total receipts ..</b>	<b>3,217.0</b>	<b>3,360.3</b>	<b>3,413.1</b>
<b>Surplus .....</b>	<b>67.6</b>	.....	.....

\* Including the surplus allocated from the ordinary revenues, amounting in 1925 to 396,400 Finnish marks and in 1926 to 493,400 marks.

\* Including the surplus referred to above.

Finland's national debt on Dec. 31, 1926, amounted to 2,475,300,000 Finnish marks, of which 1,714,000,000 marks represents foreign loans.

**COMMUNICATIONS.** On Jan. 1, 1925, the merchant marine of Finland aggregated 4652 vessels of 457,884 net registered tons. In the same year 7307 vessels of 3,443,071 net tons entered the ports of Finland and 7243 vessels of 3,473,186 net tons cleared. The total length of the railroads (state) at the end of 1925 was 4434 kilometers, of which 192 kilometers were double track. Rolling stock consisted of 667 locomotives, 1167 passenger cars, and 18,052 freight cars. The total number of employees was 23,771, as compared with 20,352 during 1924. During 1925 the state railways showed a profit of 163,400,000 marks, exclusive of costs for old loans amounting to 220,066,400 marks. The total number of passengers transported was only 21,173,900, as against 27,522,400 in 1924. Freight traffic, on the other hand, showed a considerable increase, amounting to 8,807,299 metric tons as against 7,790,176 tons for the previous year. In spite of the decrease in passenger traffic, income from this source amounted to 240,296,100 marks, or 19,769,300 marks over the previous year's receipts. Freight traffic income amounted to 460,121,200 marks, an increase of 62,844,000 marks over 1924. Total revenue amounting to 726,224,000 marks, was 84,660,300 marks greater than for the year before, while expenditures increased to 562,795,000 marks from 561,620,000 marks. Thus the surplus of income was 163,429,400 marks, compared with 79,943,900 marks the year before.

**GOVERNMENT.** According to the constitutional law of July 17, 1919, Finland is a republic. Executive power is vested in a president elected for six years by the votes of the citizens and in a ministry appointed by him but responsible to the house of representatives; legislative power in a house of representatives consisting of 200 members chosen by direct and proportional election, all male and female citizens who have reached their 24th year possessing the right to vote. President of the Republic, Dr. Lauri Relander, elected Feb. 16, 1925. The cabinet as appointed in January 1926, was composed as follows: Prime Minister, Dr. K. Kallio; Foreign

Affairs, Dr. E. N. Setälä; Finance, Dr. K. Järvinen; Interior, G. Ignatius; Defense, A. L. Hjelman; Justice, U. Castrén; Education, Dr. L. Ingman; Agriculture, Dr. J. E. Sunila; Communications, J. Niukkanen; Commerce and Industries, T. Reinikka; Social Affairs, K. A. Lohi.

**HISTORY.** The year was a comparatively quiet and uneventful one as far as Finland was concerned. A new cabinet was formed on the last day of 1925 and assumed the burden of government laid down by Premier Tulenheimo. The new premier was M. Kallio, the leader of the Agrarian Party. He was assisted by M. Setälä, as Minister of Foreign Affairs and M. Hjelman, Minister of Defense.

**FIRE INSURANCE.** See INSURANCE; FIRE PROTECTION.

**FIRE PROTECTION.** In 1926 according to the annual summary of *The Journal of Commerce* (New York) the fire loss record of the United States and Canada reached the total of \$393,020,500. This was the heaviest fire waste with only two exceptions in the history of the country, being only exceeded in 1906 when the San Francisco conflagration contributed a vast sum, and in 1922 when the deflation following the closing of the war was charged with being the cause of many more hazard losses and extensive forest fires produced a total of \$410,889,350.

The early months of the year were particularly bad in fire losses and when late in the summer the burning ratio took a decided drop the hope was revived that the year might close no worse or possibly better than its predecessor. A flood of losses occurred in November and December which tended to destroy any chance of an underwriting profit for the fire insurance business as a whole. See INSURANCE.

Among the outstanding features of the fire loss record in 1926 was the very pronounced number of losses in which the actual fire damage was relatively small, but because of the nature of the property damaged the resultant loss ran to very considerable figures.

The monthly record for the year 1926, as compiled from the daily records of *The Journal of Commerce*, is given in the following table together with the monthly records of the two preceding years and it will be noted that the slump in the burning ratio which started last September was of short duration:

	1924	1925	1926
January ...	\$41,243,000	\$41,210,400	\$41,118,750
February ..	31,447,900	32,472,000	30,963,750
March .....	28,406,150	33,846,500	42,854,600
April .....	31,815,900	37,696,800	52,408,400
May .....	27,832,300	29,170,800	32,764,200
June .....	20,350,400	23,650,800	28,676,000
July .....	23,968,800	29,622,000	31,723,400
August .....	31,349,000	23,348,750	27,833,400
September ..	29,612,400	25,396,250	19,309,000
October .....	27,944,400	23,991,250	14,877,000
November ...	39,081,600	30,820,000	26,724,400
December ..	44,476,800	43,275,000	43,757,600
<b>Total ..</b>	<b>\$377,528,650</b>	<b>\$373,500,550</b>	<b>\$393,020,500</b>

The Committee on Statistics and Origin of Fires of the National Board of Fire Underwriters in its annual report for 1926 presented its usual table on fire losses in the United States over a period of years. Previous to 1916 the records of *The Journal of Commerce* were used. Subsequent years were based on returns to the Actuarial Bureau Committee adding 25 per cent for unreported and uninsured losses.

## FIRE LOSSES BY YEARS

1925.....	\$570,255,921	1899.....	\$158,597,880

1900.....	160,929,805		

Total, 51 years ..... \$10,468,158,909

The statistics of fire losses for 1925 prepared by the National Board of Fire Underwriters were studied carefully and analyzed in 1926, with the idea of instituting further methods of protection, as it was realized that most of the fires were strictly preventable. The revised total of \$559,428,858 indicated a burning rate of \$1.064 a minute, or a daily rate of burning of \$1.532,682. The chief source of fires was under the heading "matches—smoking," with an ascribed loss of \$30,303,815, followed by "defective chimneys and flues," with \$21,673,853. Next came "stoves, furnaces, boilers, and their pipes," \$20,416,785; "spontaneous combustion," \$17,391,398; "electricity," \$15,168,864; and "sparks on the roof," \$14,680,187. It can be apprehended from these items that the majority of fires could be prevented by adequate care and legal or other inspection, and that the people generally and the communities as organized had themselves to blame for the vast losses. Thus defective chimneys and flues can be regarded as a cause strictly preventable, while electricity, which is the safest form of light, heat, and power when properly installed and used, was responsible for a loss in excess of \$15,000,000. Rubbish and litter also contributed to many fires, as did various explosions. The unknown causes of fires in 1925 were responsible for damage totaling \$199,179,533, although a number of these fires were doubtless preventable and due to careless-

ness or improper supervision. Lightning in 1925 was charged with a total loss of \$13,196,918.

One of the leading menaces was the extensive use of shingle roofs, and this cause was largely responsible for a serious conflagration which took place at Newport, Ark., on Mar. 1, 1920, with a resulting loss of \$1,500,000. Here 270 dwellings, of which 264 had shingle roofs, were destroyed. A result of this conflagration was that the citizens of Newport passed an ordinance prohibiting in subsequent construction the use of wooden shingles. That there had been progress

## COMPARATIVE FIRE LOSSES

From Report of the Committee on Statistics and Origin of Fires, National Board of Fire Underwriters

\* Estimated from Records of the Actuarial Bureau.  
 \* Actual figures reported.

made in this field was indicated by the report of the National Fire Underwriters' Association, in which it was indicated that by July 1, 1926, approximately 185 communities in the United States had adopted and were enforcing ordinances prohibiting the use of wooden shingles as a roof covering. Nevertheless, there remained many cities where this condition represented a very serious conflagration hazard and it was held accountable for a large portion of the fire loss.

During the year there was a growing tendency to enact ordinances fixing the cost of extinguishing fires upon persons disobeying fire prevention orders. During the year such an ordinance was passed in Kalamazoo, Mich., and the cities of Cleveland and Cincinnati, Ohio, has enforced such measures for several years with marked success.

A notable departure in fire protection was the putting into service during the year of a new Diesel electric fire boat, the *Port Houston*, which was built for the Harris County-Houston

## STATISTICS OF FIRES IN LARGER AMERICAN CITIES—1925, FROM REPORT OF THE COMMITTEE ON STATISTICS AND ORIGIN OF FIRES, NATIONAL BOARD OF FIRE UNDERWRITERS

City	Area sq. miles	Population	Number of alarms	Number of fires	Confined to building or place of origin	Total loss	Number of fires per 1,000 population	Loss per capita
New York .....	314.75	5,873,356	28,091	22,849	22,463	\$18,869,085	3.89	\$3.21

Ship Canal Navigation District Commission. This boat was 125 feet 10 inches long overall, 27 feet beam, and had a draft of 8 feet 6 inches. Her main power equipment consisted of two main and one auxiliary generating units, the main sets being composed each of one 500 hp. six-cylinder Diesel engine operating at 420 revolutions per minute and direct-connected with a 350 kw., 500 volt generator and a 25 kw., 125 volt exciter. The auxiliary set was a 165 hp., 6-cylinder Diesel engine operating at 425 r.p.m. and direct-connected with a double generator having a total capacity of 100 kw. at 270 volts. For propulsion, two electric motors of 260 hp. each were used, while for pumping two 410 hp. electric motors were used, direct-connected with centrifugal pumps delivering their rated capacity at 175 revolutions per minute. The two pumps could supply 3500 gallons per minute at a pressure of 300 pounds per square inch, or a maximum of 7000 gallons per minute at 150 pounds per square inch. There were 39 nozzles distributed around the boat.

On Apr. 7, 1926, occurred the worst oil fire recorded, when three reservoirs of crude oil on the storage farm of the Union Oil Company in San Luis Obispo County, Calif., were simultaneously ignited and caused six reservoirs formed with concrete-lined earth banks over 20 feet deep, with roofs of tar paper on wooden posts on concrete piers, to burn. These reservoirs held from 750,000 to 1,000,000 barrels each, and, in addition, there were 19 tanks formed by steel shells with tops of wood covered with roofing felt. The fire burned for five days and destroyed approximately 5,000,000 barrels of oil valued at \$7,000,000. There were two men killed and incidental damage by no means slight was done

to the neighborhood. The day following the start of the San Luis Obispo fire, two reservoirs at the Union Oil Company's Stewart Station, near Brea, Calif., were struck by lightning and a fire very similar to that discussed above resulted, with a total loss set at approximately \$3,000,000.

One of the small but notable fires in 1926 was that of the Shakespeare Memorial Theatre at Stratford-on-Avon, on Mar. 6, 1926, which destroyed the auditorium, but by the efforts of the fire brigades the library and museum and valuable relics were saved. This fire was due to some unknown cause and completely gutted the building.

**FIRES, FOREST.** See FORESTRY.

**FISHES.** See ZOOLOGY.

**FISHKILL, N. Y., ANNIVERSARY OF STATE CONSTITUTIONAL CONVENTION.** SEE CELEBRATIONS.

**FISK UNIVERSITY.** A coeducational institution for negroes at Nashville, Tenn.; founded in 1866. It consists of a college, high school, junior high school, and a music department. The total enrollment of 638 for the autumn of 1926 included 295 men and 343 women, and was distributed as follows: college, 485; high school, 72; junior high school, 28; music department, 157. The faculty numbered 45 and there were 18 administrative officers. The library contained approximately 12,000 volumes. The productive funds for 1925-26 amounted to \$289,752.30 and the income to \$127,604.42. On Dec. 7, 1926, Thomas Elsa Jones, M.A., Ph.D., was inaugurated as president.

**FITZGERALD, DESMOND.** American civil engineer, died at Brookline, Mass., September 22. He was born in Nassau, New Providence, Bahama

Islands, May 20, 1846, and studied at the Providence, R. I. High School, and Phillips Academy, Andover, Mass., becoming a student in the engineering office of Cushman & DeWitt of Providence, R. I. In 1867 he became an axeman on the surveying staff of the Indianapolis & Vincennes Railroad, and was promoted through successive grades until he was a transitman earning \$75 a month. In 1870 he was appointed chief engineer of the Cairo & Vincennes Railway, later becoming division engineer of the Rockford, Rock Island & St. Louis Railroad. A brief period spent on Federal river improvement work was followed by his service as chief engineer on the Boston & Albany Railroad, 1871-73. In 1872 Fitzgerald became connected with the supply end of the Boston water-works and in 1898 he was engineer of the Sudbury Department of the Metropolitan system, serving until 1902. While engaged with the Boston water supply system Fitzgerald designed and constructed a number of important dams and reservoirs, and developed systematic efforts to prevent water pollution, organizing this work both on the legal and physical sides. He was also interested in studies of evaporation and the biology of water supplies. He developed schemes for the diversion of sewage from the Boston water gathering grounds. Fitzgerald was chairman of the Massachusetts Topographical Survey Commission, and of the Brookline Park Commission, and was a member of the Metropolitan Improvement Commission of Massachusetts. He was consulting engineer of water supply and sewage systems for Manila, P. I., 1904. He was president of the American Society of Civil Engineers in 1899, and was a fellow of the American Academy of Arts and Sciences. In addition to his engineering work, he made extensive collections of paintings by American and European artists, including works of Claude Monet and Dodge MacKnight, and of Korean and Chinese pottery. These works of art were made accessible to the public in the gallery connected with his home which he built in 1913.

**FIUME**, fyōō'me. A small state consisting of a single city, whose independence was acknowledged by the Treaty of Rapallo between Italy and Jugo-Slavia, Nov. 12, 1920. After a brief and tempestuous career it was turned over to Italy by a subsequent treaty with Jugo-Slavia, Jan. 27, 1924. Area, about eight square miles; population at the census of 1921, 84,686.

**FIXED NITROGEN PRODUCTS.** See FERTILIZERS.

**FLAX.** The International Institute of Agriculture, Rome, estimated the 1926 flaxseed production of reporting countries at 7.7 per cent above the average but as only 82.5 per cent of the crop of 1925, which was the largest ever recorded. The production of the more important producing countries for which data were on hand was estimated as follows: Lithuania 1,837,700 bushels, Canada 6,715,000 bushels and India 16,040,000 bushels. The flaxseed crop of the United States, as estimated by the Department of Agriculture, was 19,459,000 bushels produced on 2,897,000 acres or at the rate of 6.7 bushels per acre as against 22,424,000 bushels grown on 3,078,000 acres and an average yield of 7.3 bushels per acre in 1925. In spite of the smaller production the average farm price Dec. 1, 1926, was only \$1.941 per bushel while the corresponding price the year before was \$2.265 per bushel. The total crop value on this basis for the two years

was \$37,775,000 and \$50,738,000 respectively. The production of the four leading States of the ten States reporting yields was as follows: Minnesota 8,554,000 bushels, North Dakota 6,736,000 bushels, South Dakota 2,755,000 bushels and Montana 804,000 bushels. The area devoted to the crop in 1926 in these States was 910,000, 1,271,000, 475,000 and 171,000 acres respectively.

The total quantity of flaxseed used in the production of linseed oil in the United States is approximately 35,000,000 to 40,000,000 bushels annually and to meet this domestic requirement about 15,000,000 to 20,000,000 bushels are imported each year, mostly from Argentina and Canada. The United States, the heaviest single consumer of flaxseed, imports as much flaxseed and linseed oil as it produces. The import duty on flaxseed is 40 cents per bushel with a drawback of about 10 cents per bushel for the re-export of cake. The monthly average price of flaxseed during the crop year was from 22 to 40 cents per bushel higher at Minneapolis than at Winnipeg. The principal flaxseed exporting countries are Argentina, British India and Canada and the principal importing countries the United States, the United Kingdom, the Netherlands, Germany and France. The lower prices for flaxseed prevailing during the past year are attributed to a large extent to the record crop of Argentina for 1925-26 which amounted to over 75,000,000 bushels, of which over 47,000,000 bushels was available for export and carry-over.

Estimates of flax fibre production for different countries were reported by the International Institute of Agriculture, Rome, as follows: Lithuania 92,922,900 pounds, Latvia 52,605,100 pounds, Czecho-Slovakia 27,976,300 pounds, Estonia 23,648,400 pounds, Netherlands 14,991,500 pounds and Austria 6,327,300 pounds. The Soviet Republics in 1925 produced 890,542,000 pounds, Poland 131,913,600 pounds, Belgium 51,353,100 pounds, France 39,205,800 pounds, the Serb-Croat-Slovene State 22,518,300 pounds and Ireland 13,104,000 pounds. A preliminary estimate placed the flax fibre imports of the United States at 7000 tons representing a value of more than \$3,000,000. The propagation of pure-line varieties of fibre flax was reported as receiving attention in the United States, Japan and several European countries and successful experiments in growing fibre flax were reported from Tamaulipas, Mexico.

**FLOOD PROTECTION.** During 1926 the Los Angeles County flood control project was well under way and work was done on several of the dams essential to the plan. Progress was made on the Pacoima dam, an arched concrete structure 375 feet in height when finished, while the Santa Anita dam, the Saw Pit dam, and the Puddingstone earth-fill dam were under construction. Los Angeles County in 1924 had voted a bond issue of \$35,300,000, of which amount \$25,000,000 was for a dam of great size on the San Gabriel River. During the year 1926 a controversy was active as regards the San Gabriel River dam, it being alleged that the structure was improperly located and interfered with needed extensions of Pasadena's water supply. The Los Angeles County Board of Supervisors accordingly appointed a committee of three engineers to consider the programme adopted for the county flood control district with respect to the San Gabriel River.

At the election, November 2, a proposed bond issue of \$26,000,000 for further work by the

Los Angeles, Calif., County Flood Control District was defeated, being opposed by the Los Angeles city committee of the California Taxpayers' Association, the Los Angeles chapter of the American Association of Engineers, and other organizations. This issue was intended to pay for supplementing the work begun two years previously, when a bond issue of \$35,300,000 was approved.

**FLOODS IN THE CENTRAL STATES.** In Illinois, Iowa, and Kansas, heavy rainfalls in the late summer and early autumn were responsible for floods which caused considerable damage. In the Illinois River the highest stage reached was only about three feet below that of 1922, but the levees held and, with the Mississippi low, there was a free run-off for flood waters. At some points, emergency sandbag work was required, and there was inundation due to flood waters from the hills and seepage, so that enormous damage to crops was done and several bridges were washed out. At Jacksonville, Ill., the dam of the water-supply reservoir was carried away. In the case of some of the tributary streams, flood heights were greater than in the Illinois. In Iowa and Kansas, also, considerable damage was done.

At the fourteenth meeting of the National Drainage Congress, held at Oklahoma City, January 18-20, a number of important papers and discussions had as their subject flood control, particularly in Western and Southwestern states. Flood insurance, while expensive, was urged as necessary in many localities, particularly those in which danger of cloudburst rainfall was imminent. As a result, a number of cities in the United States either had under way or were considering flood-control works, and the Federal Government, in certain cases, was coöperating with the local authorities in the development of various projects—at least by making preliminary surveys and studying the essential facts in connection with the rivers and rainfalls.

The State flood control commissioners of Texas, Oklahoma, and New Mexico met in conference in November at Amarillo, Tex., to discuss joint action in the flood control of the Canadian River, which is a most important unit in the Arkansas River system, having a length of 1000 miles and a drainage area of 60,000 square miles. It was believed that the construction of three dams would give storage capacity for 500,000 acre-feet each and for hydro-electric development, as well as rendering large areas of fertile land available for irrigation. Such works would not only control the river and avoid the constant losses of railway and highway bridges in times of flood, but would develop important resources.

**PUEBLO, COLORADO.** During the year work was in active progress on the north levee of the relocation of the Arkansas River through the City of Pueblo. The cement lining was placed on this channel, which was three miles long and affords a depth of 30 feet to carry the stream water.

**LENINGRAD, RUSSIA, FLOOD PROTECTION.** During the year announcement was made of three general projects which had been proposed for sea flood control at Leningrad, Russia, to protect parts of the city from periodic inundations. These projects were prepared by the interdepartment commission of city and state offices and aimed to deal with a danger that had been apparent

for nearly two centuries, and for which various schemes had been suggested; but few steps had been taken so far as the actual construction stage. Even in the days of Peter the Great it was proposed to dig a net of channels across the city area in order to facilitate the flow of water from the River Neva into the bay, as this was thought to be a contributing cause of the floods, and some of the channels built during the reign of Catherine II are still existent. In 1824, after a flood where the water rose to a height of 13 feet 8 inches, plans were requested from foreign engineers, but they were based on the fallacious assumption that the floods in the estuary of the Neva were due to river discharge. A disastrous flood occurred on September 23, 1924, when approximately the entire City of Leningrad, some 50 square miles in area and with a population of over 1,000,000, was suddenly flooded to an average depth of 5 to 7 feet. As this occurred in the daytime there was approximately no loss of life, but it led to the formation of a commission composed of meteorologists, hydrologists and civil engineers which found that the cause of the floods was a sea wave. Accordingly, three general projects were formulated based on this assumption and there was put under way the study of the meteorological conditions leading to the general rise of the Baltic Sea as reflected in the Finnish Gulf and the suddenly increased height of wave coming from the Baltic which became a serious source of danger by the time it reached Leningrad.

The commission proposed the construction of dams, the nature and location of which varied in the different projects. In the first scheme two dams were to be built between the shores of Neva Bay and Kotlin Island, the northern dam being from 5 to 15 feet in height and  $7\frac{1}{2}$  miles long, while the southern dam would range in height from 3 to 6 feet and be  $3\frac{1}{2}$  miles in length. There would be spillways in both dams protected by gates to permit the passage of Neva River waters into the sea. In the southern dam there would be a navigable pass either protected by a gate or else constructed as a lock. This arrangement would be adequate to take care of the greatest flow of river water which had ever been recorded, for the greatest rise on record as well as the annual period of flood water does not seriously affect the city.

Another project would involve but one dam across the Bay, situated halfway between Kotlin Island and the city, which would range in height from 5 to 10 feet and be 8 miles in length, being equipped with spillways and either a lock or a gate to facilitate the passage of shipping. This would make an area of approximately 50 square miles of bay behind the dam. The third plan would require the building of high dams running along the shore lines of the islands, and they too would have spillway outlets and openings for navigation, the total length of the dams being greater, but conditions for their construction were more favorable, as they would not be exposed to the violence of the sea wave. In the second and third schemes a necessary element would be a river dam upstream. The interdepartment commission during the year was studying the question further, and surveys and plan drawings were being made to decide on the best and cheapest plans, from an engineering standpoint.

**PARIS DISTRICT.** To obviate the menace of

dangerous floods that threatened Paris, a scheme was proposed during the year by E. Maynard and published in *Le Génie Civil*. It was proposed to intercept the water of the Marne River at Neuilly and construct a regulating dam, so that the flood waters could be diverted first through a section of gravity canal and then raised by electric centrifugal pumps to the top of a small divide, whence they would be carried into the Seine at La Briche by means of pipe and open channel. Of course, this would require electric power to be available during the flood season, and it was stated that the cost would be less than the damage due to the flooding of Paris. The cost of the entire work was estimated at 285,000,000 francs, plus 7,500,000 francs for the cost of electric power necessary to run the pumps over a period of 25 days, which was assumed as the average time of flood danger. In the winter of 1925 a rainfall of 773 millimeters was recorded, as compared with a normal rainfall of about 515 mm., and it was estimated that the diversion works plan would carry flood waters to the amount of 21,000,000 cubic meters in 24 hours, an amount sufficient to keep the Seine in check.

MEXICO. A serious flood occurred at León, State of Guanajuato, in the early summer. This settlement is located on a dry arroyo, where the channel had been allowed to fill with dumping from refuse as well as with the deposition from stream wash. Banks had been constructed along this watercourse through the town, as there had been former floods, but this slight protection had not been maintained in good repair. In addition, there were a number of small farmers' reservoirs with earth dikes and no spillways, so that after a three days' rainfall of moderate rate a heavy downpour in the night caused the stream to overflow and also flooded the reservoirs mentioned, which broke when the increased flow of water came. There has been a growing population in the town and foundations of buildings were in some cases below the river bed. The lower areas of the district were inundated to a depth of two and three meters, and the total loss of life was estimated at 100 or more.

**FLORIDA.** POPULATION. A State census was taken in 1925. The result showed a total population of 1,263,549, compared with 968,470 by the Fourteenth United States census of 1920, an increase of 295,079 in the five-year period. The estimated population of the State on July 1, 1926, was 1,317,000. The capital is Tallahassee.

AGRICULTURE. The following table gives the acreage, production and value of the principal crops in 1925 and 1926:

Crop	Year	Acreage	Prod. bu.	Value
Corn	1926	551,000	7,714,000	\$7,097,000
	1925	580,000	8,700,000	8,700,000
Potatoes	1926	24,000	2,832,000	7,080,000
	1925	23,000	2,852,000	7,415,000
Sweet potatoes	1926	28,000	2,800,000	3,500,000
	1925	29,000	2,465,000	3,451,000
Cotton	1926	109,000	33,000 <sup>a</sup>	1,683,000
	1925	101,000	38,000 <sup>a</sup>	3,589,000
Tobacco	1926	5,500	5,076,000 <sup>b</sup>	1,762,000
	1925	7,000	5,824,000 <sup>b</sup>	1,805,000
Peanuts	1926	27,000	14,860,000 <sup>b</sup>	742,000
	1925	41,000	24,600,000 <sup>b</sup>	787,000
Hay	1926	74,000	55,000 <sup>c</sup>	1,190,000
	1925	82,000	57,000 <sup>c</sup>	1,296,000

<sup>a</sup> bales, <sup>b</sup> pounds, <sup>c</sup> tons.

MINERAL PRODUCTION. The production of phosphate rock, the chief mineral industry of the

State, of which Florida is the chief U. S. producer, was well sustained in 1925 as to quantity, but the price obtained was low. In 1924 were produced 2,432,581 long tons; in 1923, 2,547,653 long tons. The product in 1924 was valued at \$8,017,476; in 1923, at \$9,059,427. Stone was produced to the quantity in 1924 of 2,973,360 short tons, and in 1923 of 1,494,080 short tons; and to the value of \$2,942,778 in 1924, and \$1,425,434 in 1923. Production of fuller's earth increased to 64,731 short tons in 1924, from 60,996 short tons in 1923; and to a value of \$1,037,642 in 1924, from \$973,121 in 1923. Clay and clay products, sand and gravel, peat and zircon were produced in commercial quantities. The total value of the State's mineral production was \$13,101,223 in 1924; and in 1923, \$12,557,882.

FINANCE. As summarized by the United States Department of Commerce, payments for the maintenance and operation of the general departments of the State for the fiscal year ending June 30, 1925, were \$7,272,253, or \$5.79 per capita, as against \$5.55 in 1924 and \$3.83 in 1917. Their total included \$566,744 for education, apportioned to minor State divisions. Expenses totaling \$569,195 for interest on debt and \$8,163,319 for permanent improvements, added to the payments for maintenance and operation of State departments made the total of State payments \$16,004,767. For highways was expended the sum of \$7,055,172, of which \$602,485 was for maintenance and \$6,452,687 for construction.

Revenue receipts of the State were \$17,155,408, or \$13.65 per capita. They exceeded by \$9,313,960 the total payments except those for permanent improvements, and furthermore, exceeded by \$1,150,641 the total with these included. Property and special taxes formed 35.2 per cent of the revenue in 1925, as against 41.8 per cent in 1924 and 66 per cent in 1917. Their per capita rate was \$4.81 in 1925, \$4.89 in 1924 and \$2.58 in 1917. Earnings of the general departments and compensation for officials' services furnished 6.2 per cent of the 1925 revenue; business and non-business licenses, 39.8 per cent. License receipts were derived chiefly through taxes on incorporated companies and the sales of gasoline and from licenses for motor vehicles.

The net indebtedness of the State on June 30, 1925, was \$274,042, or 22 cents per capita, as against 26 cents in 1924 and 66 cents in 1917. The assessed valuation of property subject to State tax was \$475,197,304. The State tax levy was \$5,122,303, or \$4.08 per capita.

TRANSPORTATION. The total mileage of railroad line in operation at the end of 1925 was 5451.51. In 1926 there were constructed 233 miles of new first track, 222 miles of new second track, and one mile of third track; a total of 456 miles of track. In respect to construction of new first track in the year the State ranked second, Texas standing first, and in respect to total of all new trackage, Florida ranked first among the States. The chief additions were the completion of the Seaboard All-Florida from West Palm Beach to Miami, 70 miles, and a line from Ft. Ogden to Naples, 68 miles in length, both subsidiary to the Seaboard Air Line; and lines aggregating 94 miles, and forming parts of the Atlantic Coast Line, in the western portion of the State. No important abandonment of railroad line occurred.

EDUCATION. A constitutional amendment sub-

mitted by the State Legislature of 1925 and having an important bearing on educational activity in the less wealthy counties was ratified by popular vote at the general election on November 2. Under this amendment the Legislature obtained the power to make appropriations for the purpose of providing longer school terms in counties where insufficient funds for this purpose were available. The school population of the State in 1925, the latest year for which the figure was available, numbered 391,299. In 1926, the total enrollment was 343,028. Of this number 307,924 were enrolled in common schools; in high schools, 35,064. Expenditure for public education in the State in 1926 amounted to \$31,054,264. The average salary of teachers was \$118.28.

**CHARITIES AND CORRECTIONS.** Among the charitable and correctional institutions of the State in 1926 the chief were the following: the State Hospital, Prison Farm, Industrial School for Boys, Industrial School for Girls, Farm Colony for the Feeble Minded and Epileptic, and School for the Deaf and Blind.

**POLITICAL AND OTHER EVENTS.** At the general election on November 2, Sen. Duncan U. Fletcher, Democratic candidate for the United States Senate, was reelected over two Republican opponents. For Congress from the first district, Herbert J. Drane was reelected. From the second district, Robert A. Green was reelected. In the third district Thomas A. Yon defeated J. H. Smithwick. From the fourth district W. J. Sears was reelected. The Supreme Court, for 1927, was to be composed as follows: Chief Justice, W. H. Ellis; Associate Justices, James B. Whitfield, Rivers Buford, Glenn Terrell, Armstead Brown and L. W. Strum.

In the middle and latter part of July financial difficulty affected a number of small banks in Florida, dependent on financial connection with a larger institution in Atlanta, which was forced to suspend when they had ceased payment. The Seminole Indians of Florida, the only Indian tribe that has not received Federal aid, addressed to President Coolidge in November through their chief, Tony Tommy, a request that the truce made with Osceola in 1827 be ended and that they be allowed to swear allegiance and become citizens of the United States. The total number of the Seminoles was about 300. The State gave notice in the U. S. Supreme Court that it would contest unequal remittances to States under the new inheritance tax law and filed a brief against the Federal law August 4.

The most serious occurrence of the year in Florida was the hurricane of September 18. A West Indian storm of exceptional violence entered the territory of the State by the east coast in the latitude of Dade, Brevard and Palm Beach Counties, at the south of the peninsula. It took a northwesterly direction across the State, passed out into the Gulf of Mexico, and eventually reached the Pensacola area in west Florida. It diminished in intensity as it progressed, but was still sufficiently severe to do material damage in the Pensacola area and in Alabama on the 19th. Miami was the chief sufferer in point of property destroyed, because the city stood near the centre of the hurricane path and because of the value of the real estate improvements at that point. Small vessels were carried ashore by the force of the wind and by the rise of the sea level occasioned by the inward drift of water propelled by the storm, and were

left stranded within the city. Houses, particularly the buildings more lightly constructed, were partly or wholly blown down. Window glass was generally broken from its place. Trees, shrubbery and the like in parks and streets were thrown down. The water invaded part of the city and strewed it with wreckage.

Similar damage was done at Fort Lauderdale and other neighboring places along the coast. Moore Haven and Fort Myers suffered severely. The loss of life, estimated at 370 persons, and cases of injury, much more numerous, were distributed over the storm area, and occurred largely outside of Miami. It was afterward reported that the area most severely stricken comprised about 500 square miles. Citrus fruit growers inland incurred a heavy loss of crops. Damage to buildings was in part covered by insurance. Measures of relief were taken by the American Red Cross, which issued an appeal for \$5,000,000 for this purpose. Before the completion of the amount Florida authorities announced that the State expected largely to be able to care for its own needs. Estimates of the property damage varied, that of one well informed resident of Miami being \$25,000,000.

**OFFICERS.** Governor, John W. Martin; Secretary of State, H. Clay Crawford; Treasurer, J. C. Luning; Attorney-General, J. B. Johnson; Comptroller, Ernest Amos; Superintendent of Public Instruction, W. S. Cawthon; Commissioner of Agriculture, Nathan Mayo.

**JUDICIARY.** Supreme Court: W. H. Ellis, Chief Justice; Associate Justices, James B. Whitfield, Armstead Brown, Glenn Terrell, Rivers H. Buford, L. W. Strum.

**FLORIDA, UNIVERSITY OF.** A State institution of higher education at Gainesville, Fla.; founded in 1905. In the autumn of 1926 there was an enrollment of 1871, distributed as follows: Agriculture, 113; arts and sciences, 661; engineering, 250; architecture, 36; law, 249; pharmacy, 48; teachers, 154; business administration, 340; graduate students, 28. There were 878 enrolled for the summer session. The faculty numbered 118, not including student assistants. Of this number seven were additions. In 1926 the financial condition was as follows: Maintenance fund, \$501,666; endowment, \$18,000; value of equipment, \$3,560,000. The library contained 45,000 volumes. New buildings were in process of construction for chemistry and horticulture, and an addition to the engineering building, the total cost to be about \$500,000. A Professorship of Southern History and Americanization was established during the year. The School of Business Administration and the School of Architecture, previously departments of other schools, were established as separate colleges. A number of scholarships and student loan funds were given to the University during the year, among them one of \$10,000 from the late Governor Broward. President, Albert A. Murphree, LL.D.

**FOOD.** See **AGRICULTURE**.

**FOOD AND NUTRITION.** **FOOD PRICES, United States.** The index number for wholesale prices of foods reported by the Bureau of Labor Statistics, U. S. Department of Labor (*Monthly Labor Review*, vol. 23, p. 212), was 152 for September and for October, 1926, as compared

with 157.6 for October, 1925, and 100 for 1913. *Bradstreet's* Food Index Number based on the wholesale prices per pound of 31 articles used for food was \$3.48 for the week ended December 23 as compared with \$3.54 for the previous week and \$3.57 for the week ended Dec. 24, 1925. The Bureau of Labor Statistics logarithmic curve of retail food prices based on 43 articles of food was slightly lower throughout the year than the peak of the 1925 curve but continued to be higher than at any time since the sharp decline in 1920. The retail prices on October 15 of 15 of the 43 foods listed in these calculations showed an increase of 1 per cent or more over the figures of Oct. 15, 1925, 22 a decrease of 1 per cent or more, and 5 practically no change. The average cost of all the listed foods was 1 per cent lower on Oct. 15, 1926, than on Oct. 15, 1925.

*Other Countries.* The general trend of retail prices throughout the world may be seen from the accompanying table compiled from data reported in the *Federal Reserve Bulletin* of December, 1926. The index numbers, which have been constructed by the various foreign statistical offices, are based on the prices of a number of articles of food weighted according to different standards, but all unless otherwise noted referable to the original pre-war basis of 100. Increases are shown in six countries, decreases in seven, and practically no change in four.

INDEX NUMBERS OF RETAIL FOOD PRICES IN PRINCIPAL COUNTRIES  
(Pre-war = 100)

Year and month	Austria (Vienna <sup>a</sup> )	Belgium <sup>b</sup>	European countries		France (Paris)	Germany

**FOOD RESEARCH.** The work of the Food Research Institute at Stanford University was concerned chiefly, as heretofore, with the economics of the production, distribution, and consumption of wheat. Factors considered responsible for the steady decline in the per capita consumption of bread (from 5.41 bushels of wheat per capita in 1899 to 4.23 in 1923) were a tendency to replace the cereals with sugar, a decrease in total food requirements per capita, a tendency to a more diversified diet, and a shift to more expensive foods generally, the last resulting chiefly from the increased prosperity of the laboring classes since the war. The third annual report of the Chief of the Bureau of Home Economics, U. S. Department of Agriculture, showed considerable progress in the research work of that bureau. Various publications were issued by the bureau during the year, including "Canning Fruits and Vegetables at Home," by Louise Stanley (*Farmers' Bulletin 1471*); "A Guide to Good Meals for the Junior Home Maker," by R. Van Deman and C. L. Hunt (*Miscellaneous Circular 49*); "Proximate Composition of Beef," by C. Chatfield (*Department Circular 589*); and "Vitamins A,

B, and C," by S. L. Smith (Mimeographed Circular).

A conference to discuss ways and means of obtaining the facts needed to give an adequate picture of American food habits was held at the Bureau on April 17 and participated in by about 30 scientists representing organizations that have made studies of American food habits. At the close of the conference resolutions were adopted recommending that a comprehensive study be undertaken of family food consumption in the United States with reference to quality, quantity, racial and geographical variations, and cost in proportion to family income. Research in food and nutrition at the State agricultural experiment stations under the Purnell Act was in progress at 31 of the 50 stations. A national co-operative project, The Vitamin Content of Food in Relation to Human Nutrition, was receiving attention in 24 studies at 17 stations. Another of the national projects, Factors Which Influence the Quality and Palatability of Meat, was receiving the help of the home economics departments in the cooking of the meat at five of the stations. Food consumption and expenditure studies were being conducted at 10 of the stations. A wide range of subjects was included in the remaining projects.

**NUTRITION INVESTIGATIONS.** *Nutrition and Growth.* Special nutrition classes and supple-

mentary lunches in the schools had become an established custom throughout the country and demonstrated the beneficial effects upon undernourished children of such supplementary feeding. Kaiser, Norton, and Walker (*Amer. Jour. Diseases Children*, vol. 31, p. 386) from a study of the weight records of a large number of school children six months and a year after the close of nutrition classes came to the conclusion that the supplementary lunches should be given to the whole school instead of to the underweight children only, and that to secure permanent results in school nutrition work the coöperation of the parents in regulating the child's habits and continuing the nutrition programme is essential.

An extensive investigation of undernourishment in children with a view to determining the causes for occasional failures to gain in nutrition classes, was undertaken at the Nelson Morris Memorial Institute for Medical Research of the Michael Reese Hospital, Chicago. The first report on this investigation by Wang et al. (*Amer. Jour. Diseases Children*, vol. 32, p. 63) dealt with the gains in weight of 33 underweight

children (from Jewish, Polish, Irish, and Italian families) during periods of from two weeks to five months when the children were at the hospital under constant supervision and receiving proper diets. No child remaining longer than two weeks failed to gain and 11 reached normal and all but eight within 10 per cent of normal weight before discharge from the hospital. Racial emotional characteristics and poor home conditions leading to bad food habits were considered important factors in the previous failures to gain. Slow eating, resulting in inability to finish a meal in the usual time, apathy toward normal play and over-excitement when drawn into it, and poor dental hygiene were noted in individual cases.

**Milk for Infant Feeding.** Centres for the collection and distribution of breast milk had been in operation in the larger cities for a sufficiently long time to furnish convincing proof of their value, as well as to be of help to newer centres in the way of suggestions as to operation. The methods followed by the Children's Welfare Federation of New York were discussed by Chapin (*Jour. Amer. Med. Assoc.*, vol. 87, p. 1364). In Boston the problem of distribution of the milk had been simplified by drying what has to be sent to a distance. In reports by Emerson (*Amer. Jour. Diseases Children*, vol. 30, p. 789) and Emerson and Smith (*Amer. Jour. Diseases Children*, vol. 31, p. 1) dried breast milk was shown to be a satisfactory food for babies, including the undernourished and premature, and was recommended as possessing the advantage over the fresh milk of being available at a distance for infants too sick to bring to the hospital and too far away for the fresh milk to be transported to them. In this connection it is interesting to note that according to Brook (*Amer. Jour. Trop. Med.*, vol. 6, p. 403) the gradual replacement of condensed milk by powdered milk (Klim) for infant feeding in the Canal Zone had been accompanied by a decrease of over 50 per cent in the incidence of malnutrition and non-specific diarrhea among the infants under two years of age admitted to the Ancon Hospital.

The possibility of increasing the antirachitic properties of milk by irradiating the animals producing the milk was investigated by Hart, Steenbock, et al. at the Wisconsin Agricultural Experiment Station and by Gowen, Murray, and Gooch at the Maine station (*Science*, vol. 63, p. 97). The work at the Wisconsin station indicated that goat's milk could be made richer in antirachitic properties by systematic irradiation of the goat, but that similar irradiation of the cow did not increase the antirachitic properties of its milk. Gowen and his co-workers, however, reported that the milk of irradiated cows was also richer in antirachitic properties than the milk from the same cows not irradiated. Hess, Weinstock, and Sherman (*Proc. Soc. Expt. Biol. and Med.*, vol. 23, p. 636) demonstrated the possibility of increasing the antirachitic properties of human milk by irradiation of the mother, and in commenting upon their results stated "it clearly indicates the value of ultra-violet irradiation of the mother during lactation as a preventive of rickets in the baby. Probably during the winter months when the infant is most in need of protection from rickets the intensity of sunlight is insufficient to produce this property in the milk." That careful selection of the diet during pregnancy and lactation to insure an abundance

of antirachitic vitamin and calcium may do much to increase the resistance of breast-fed babies to rickets has been demonstrated by Grant and Goettach in rat-feeding experiments (*Amer. Jour. Hyg.*, vol. 6, pp. 211, 228). It has been suggested that a simple means of increasing the antirachitic properties of cow's milk for infant feeding would be to irradiate the milk itself, but experiments reported by Titus et al. at the Kansas Experiment Station (*Indus. and Engin. Chem.*, vol. 18, p. 843) have indicated that such treatment is likely to decrease the value of the milk as a source of vitamin A.

**The Dietary Control of Disease. Pernicious Anemia.** A diet composed especially of foods rich in complete protein and iron, particularly liver, and containing an abundance of fruits and fresh vegetables and very little fat was reported by Minot and Murphy (*Jour. Amer. Med. Assoc.*, vol. 87, p. 470) to have given promising results in the treatment of pernicious anemia. In the same number of the *Journal* (p. 476) Koessler, Maury, and Loughlin advanced the theory, based upon experimental work with rats, that pernicious and other severe anemias are the result of chronic vitamin deficiency, particularly vitamin A. A recommended system of dietary management based upon this theory included cod-liver oil, yeast tablets, butter, milk, cream, egg yolks or whole eggs, an abundance of fruits and vegetables, whole wheat bread made with milk, and, in place of muscle meat, liver, kidney, sweetbreads, or brains. See ANÆMIA, PERNICIOUS.

**Diabetes.** To simplify the dietary management of juvenile diabetes, Boyd (*Jour. Amer. Med. Assoc.*, vol. 87, p. 1020) prepared a series of unit diet formulas designed to furnish the theoretical energy requirement of an active child with protein, carbohydrate, and fat in the ratio of 7:9:21, and a sufficiency of mineral salts and vitamins. Sansum, Blatherwick, and Bodwen (*Jour. Amer. Med. Assoc.*, vol. 86, p. 178) developed a dietary system for diabetes involving more liberal amounts of carbohydrates than is usually the custom. White bread, potatoes, milk, and exceptionally large servings of fruit are among the foods included in the diet formulas, which furnish adequate protein and two grams or more of carbohydrate to each gram of fat. To keep the patient sugar-free more insulin is required but prolonged use of the diets recommended is said to bring about a gradual decrease in the insulin requirement. This evidence of partial recovery is attributed to freedom from acidosis. Other arguments in favor of this change in dietary treatment are that the patients are restored to a more nearly normal state of physical and mental activity and lose their craving for forbidden foods, and that the diets are cheaper and more palatable.

**Goitre.** The distribution of endemic goitre in the United States as shown by thyroid surveys in 40 States was summarized by Oleson (*U. S. Pub. Health Rpts.*, vol. 41, p. 2691). The reports disclosed foci of endemic goitre in localities not previously regarded as being located in goitrous territory, but in the opinion of Oleson the incidence of goitre was not so universal as to require wholesale prophylaxis in all States. The success that has attended the prophylactic treatment by iodized salt or other sources of iodine of children in goitrous localities led Marine to state in a paper on Simple Goitre and Its Prevention (*Jour. Amer. Med. Assoc.*, vol. 87, p.

1463) "supplying this element in amounts that can be considered as roughly approximating the physiologic needs of the body has resulted in completely controlling the disease both in man and in animals."

**Pellagra.** Reports by Goldberger et al. of the U. S. Public Health Service (*U. S. Pub. Health Rpts.*, vol. 41, p. 207) confirmed their previous conclusion that fresh beef and yeast contain a pellagra-preventing substance of the nature of a vitamin and indicated that this vitamin is related to vitamin B. In their opinion the vitamin originally known as water-soluble B may include the antineuritic vitamin and the pellagra-preventing vitamin, a combination of both of which is necessary for growth in rats and presumably other mammals. Should further work confirm this assumption, what is now known as vitamin B must be considered a mixture of two factors to neither of which alone could the term vitamin B be applied in the sense in which it is now used. In the dietary treatment of pellagra as practiced by Goldberger and his co-workers, 200 grams daily of fresh beef or 15 grams daily of yeast vitamin Harris powder as a supplement to the diet on which the disease had been contracted sufficed to prevent its recurrence.

**Rickets.** According to a report by Wilson (*Amer. Jour. Diseases Children*, vol. 31, p. 603) the routine administration of cod-liver oil can not be relied upon implicitly to prevent rickets, but is of greater curative value. In the extensive series of studies reported, rickets as diagnosed by Röntgen-ray occurred in babies not over a month old. This would point to the advisability of using control or preventive measures in the first month, particularly for babies born in the winter. Among the substances which have been used in the treatment of rickets are irradiated cholesterol (Parsons, *Brit. Med. Jour.* No. 3408, p. 519) and irradiated orange juice (Maslow et al., *Bul. Johns Hopkins Hosp.*, vol. 39, p. 56). Provided the irradiation had no destructive effect on the vitamin C content of orange juice, the use of irradiated orange juice would seem to be a practical method of furnishing both vitamins C and D.

**Scurvy.** A concentrated orange juice manufactured in California was recommended by Priston (*Jour. Roy. Naval Med. Serv.*, vol. 12, p. 1) for adoption by the British Admiralty as an antiscorbutic for the Navy. It was estimated that 50 gallons of the concentrate would contain sufficient vitamin C to supplement the supply available in the tropical war diet of 1200 men for three months and that about 4000 pounds would be saved annually by substituting concentrated orange juice for the lime juice now issued.

**FOOT AND MOUTH DISEASE.** See VETERINARY MEDICINE.

**FOOTBALL.** The climax of the most sensational season of college football in the history of the sport was reached at Chicago when 110,000 persons watched the thrilling struggle between the elevens representing the United States Military Academy and the United States Naval Academy. This was the largest throng that was ever present at a gridiron struggle in the United States, and the outcome, a 21 to 21 tie, appeared more than fitting. Many startling upsets marked football in 1926, perhaps the most prominent being the lamentable showing made by the Dartmouth College team, which, although practically the same as the 1925 eleven which had swept aside all opposition and was one of the sensations of its year, bowed in turn to Yale, Harvard and Brown.

Only three teams in the entire country finished their schedules without suffering a defeat or a tie, these being Lafayette in the East, Alabama in the South, and Stanford on the Pacific Coast. One of the strongest elevens of the year was produced by Brown University, the only blot on the Providence college's record being a tie game with Colgate. The fact that Coach "Tuss" McLaughry of Brown employed only eleven men in two of the team's major contests gave his aggregation the name of the "Iron Men." So perfectly conditioned were his gridiron warriors that McLaughry made few substitutions until the final game when he gave some of the seniors on the squad a chance to win their letters.

The championship of the so-called "Big Three" was won for the second year in succession by Princeton, Yale taking second honors through its defeat of Harvard. Shortly after the Princeton-Harvard game at Cambridge, Princeton announced its decision to sever all athletic relations with Harvard and thus the "Big Three," long associated in athletic rivalry, passed. Alumni of the two institutions made a few efforts to patch up matters but to no avail, and the strained situation continued.

Many All-America elevens were picked by the "experts" after the close of the season. The selections for this mythical team varied widely but four or five players appeared to be generally recognized as preëminent in their respective positions. Benny Friedman of Michigan was practically the unanimous choice for quarterback. "Vic" Hanson of Syracuse at end was rated highly. Joesting, Minnesota fullback, and Connaughton, Georgetown guard, also received universal acclaim.

A summary of the games played by the leading colleges follows:

Alabama 54, Millsaps 0; Alabama 19, Vanderbilt 7; Alabama 26, Mississippi A. and M. 7; Alabama 21, Georgia Tech. 0; Alabama 2, Sewanee 0; Alabama 24, Louisiana State 0; Alabama 14, Kentucky 0; Alabama 49, Florida 0; Alabama 33, Georgia 6.

Stanford 44, Fresno State 7; Stanford 13, California Tech. 6; Stanford 19, Occidental 0; Stanford 33, Nevada 9; Stanford 29, Oregon 12; Stanford 13, Southern California 12; Stanford 33, Santa Clara 14; Stanford 29, Univ. of Washington 10; Stanford 41, California 0.

Lafayette 35, Muhlenberg 0; Lafayette 49, Schuylkill 0; Lafayette 17, Pittsburgh 7; Lafayette 43, Dickinson 13; Lafayette 30, Albright 7; Lafayette 16, Washington and Jefferson 10; Lafayette 37, Rutgers 0; Lafayette 68, Susquehanna 0; Lafayette 35, Lehigh 0.

U. S. Naval Academy (Navy) 17, Furue 13; Navy 26, Richmond 0; Navy 24, Drake 7; Navy 27, Princeton 13; Navy 13, Colgate 7; Navy 10, Michigan 0;

Navy 58, West Va. Wesleyan 7; Navy 10, Georgetown 7; Navy 85, Loyola (Baltimore) 18; Navy 21, Army 21. Brown 14, Rhode Island State 0; Brown 85, Colby 0; Brown 32, Lehigh 0; Brown 27, Bates 14; Brown 7, Yale 0; Brown 10, Dartmouth 0; Brown 27, Norwich 0; Brown 21, Harvard 0; Brown 40, New Hampshire 0; Brown 7, Colgate 7.

Georgetown 42, Drexel 0; Georgetown 6, Pittsburgh 6; Georgetown 78, Washington College 0; Georgetown 10, West Virginia 18; Georgetown 84, Lebanon Valley 7; Georgetown 18, Syracuse 7; Georgetown 7, Navy 10; Georgetown 39, Fordham 0; Georgetown 0, Center 0; Georgetown 19, Detroit 0.

New York University 34, Niagara 0; New York University 13, Allegheny 0; New York University 24, West Va. Wesleyan 7; New York University 21, Tulane 0; New York University 30, Rutgers 0; New York University 27, Fordham 3; New York University 6, Carnegie Tech. 0; New York University 10, Davis and Elkins 0; New York University 7, Nebraska 15.

Colgate 19, Hamilton 0; Colgate 46, Clarkson 0; Colgate 44, St. Bonaventure 0; Colgate 16, Pittsburgh 19; Colgate 7, Navy 13; Colgate 38, Michigan State 6; Colgate 28, Providence 0; Colgate 10, Syracuse 10; Colgate 7, Brown 7.

United States Military Academy (Army) 21, Detroit 0; Army 21, Davis and Elkins 7; Army 27, Syracuse 21; Army 41, Boston University 0; Army 83, Yale 0; Army 55, Franklin and Marshall 0; Army 0, Notre Dame 7; Army 21, Ursinus 15; Army 21, Navy 21.

Pennsylvania 41, Franklin and Marshall 0; Pennsylvania 40, Johns Hopkins 7; Pennsylvania 44, Swarthmore 0; Pennsylvania 27, Chicago 0; Pennsylvania 36, Williams 0; Pennsylvania 0, Illinois 3; Pennsylvania 3, Penn State 0; Pennsylvania 3, Columbia 0; Pennsylvania 10, Cornell 10.

Professional football which made such a startling advance in 1925, suffered a serious setback in 1926. Inclement weather was somewhat responsible for the falling off in attendance in the larger cities comprising the National Professional Football League circuit but the advent of an new organization, termed the American League, also had a most deleterious effect. Some of the clubs were forced to disband while others barely broke even in their finances. The championship of the National League was won by the Frankford "Yellow Jackets" of Philadelphia. The Philadelphia "Quakers" captured the American League title. See SOCCER.

**FORD, HENRY.** See LABOR, AMERICAN FEDERATION OF.

**FORDHAM UNIVERSITY.** A Roman Catholic institution for higher education at Fordham, New York City; founded in 1841. It is the largest Catholic educational institution in America, and is under the Society of Jesus. The enrollment for 1926-27 totaled 5532 students, including 1320 in the graduate school and teachers' college, and a distribution among the other colleges as follows: Law, 1480; pre-law, 346; college, 1151; business administration, 93; pharmacy, 597; social service, 24; preparatory work, 521. The registration for the summer school of 1926 was 1198. There were 200 faculty members. The endowment fund on June 30, 1926, amounted to \$106,040. There were 100,000 volumes in the library. A new building providing for a new biological laboratory and lecture rooms, as well as more classroom space for that college, was under construction. A unit of the Coast Artillery Reserve Officers' Training Corps was organized in the college department during the year. President, Reverend William J. Duane, S.J., Ph.D.

**FOREIGN EXCHANGE.** See FINANCIAL REVIEW.

**FORESTRY.** From an international forestry viewpoint, the most interesting event of the year was undoubtedly the World Forestry Conference, held in Rome, Italy, from April 29 to May 5, 1928. Over 600 delegates, representing 58 widely scattered nations, all united on the proposition that the forest resources of the world must be

conserved. Opened auspiciously in the presence of the King of Italy and Premier Mussolini, the conference progressed in a very satisfactory manner except for the confusion arising from the lack of a common language. However, considerable progress was made, especially along the lines of arranging for the collection and distribution of forestry statistics, deemed an essential index to international forestry progress. Grazing, forest injury, education, research, legislation and taxation were also discussed. The monotony of regular meetings was effectively broken by several excursions to important forest districts and by the usual routine of receptions and dinners. Tentative plans for a similar meeting in 1930 were outlined.

From the standpoint of conservationists, the failure of certain powerful groups of stockmen to push through legislation giving them permanent grazing rights in the national forests was the most noteworthy happening of the year in the United States. Success on the part of the stockmen would have meant the breaking down of the governmental control policy, which aimed at equitable treatment of both large and small users and the maintenance of forest ranges in a condition of permanent productivity. The quick, general reaction against the stockmen's proposal showed that the people of the United States were wide awake to the needs of conserving the forests, and that any measures designed to weaken their rights in the national holdings would not be tolerated.

**NATIONAL FORESTS.** From figures presented in the Report of the Forester of the U. S. Department of Agriculture, the net area of the national forests on June 30, 1926, was 158,759,210 acres, an increase of 364,154 acres during the fiscal year. Most of the additions were in rather small units, the largest, 19,905 acres, being made in the Absaroka Forest in Montana. The policy of consolidating the national forests by the purchase or exchange of detached areas for privately owned sections within the publicly owned areas was continued with success. Revenues from the national forests from the sale of timber and grazing privileges exceeded \$5,000,000. A deficit in grazing receipts approximating \$300,000, caused by the waiver of fees in drought-stricken areas in the Southwest, was more than offset by increased timber sales. The construction of highways, roads, and trails designed to open up the national forests and to serve as means of access in time of fire continued as a major activity of the Forest Service during the year.

**FOREST FIRES.** Despite improved fire control practices, such as the use of airplanes for scouting, 1926 proved to be an unusually bad forest fire year, ranking fourth in the five most disastrous seasons occurring since 1905. Widespread cumulative droughts extending over a period of several years had placed the forests in very hazardous condition. Lightning was an unusually active causal agent, starting in a period of 10 days 319 out of 397 fires in Montana and northern Idaho alone, and in the Sierra National Forest in California, 65 fires during a single storm. On the other hand, man-caused fires showed an encouraging decrease. Starting early in the spring in the southern Appalachians, the fire scourge was present throughout a large part of the growing season. In the Northwest, fires were frequent until late August, when heavy rains relieved the difficult situation. Preliminary fig-

ures for the national forests alone show 704,000 acres burned over as a result of 6229 fires. Considerable progress was made during the year in studies of the causes of fires, climatic conditions associated with fire hazards and the best methods of fighting fire. Forecasts of dangerous weather conditions, disseminated by the Federal Forest Service through the press and by radio to ranchers and lumbermen, assisted materially in the reduction of fires.

**LUMBER SITUATION.** Tentative figures supplied by the National Lumber Manufacturers Association, Washington, D. C., and based upon the production of 15,800 mills, constituting approximately one-third of the total number in the United States, indicate that lumber production fell off slightly in 1926 as compared with the preceding year, for which the census showed 38,338,641,000 feet. A slight decline in 1926, amounting to 2 per cent, was not sufficient to suggest any appreciable let-up in the building activities which have proceeded at a feverish rate since the close of the World War. Adding to the United States output that of Canada, namely, 5,000,000,000 board feet, it is little wonder that conservationists ponder seriously upon that time when the great primeval forests shall have become exhausted. Evidence that the lumber manufacturers were urgently seeking to reduce unnecessary waste was seen in their active co-operation with the Federal Forest Products Laboratory in standardizing grades and in their willingness to adopt improved practices.

**DEVASTATING PESTS.** In various sections of the Western forests bark beetles became so destructive to growing timber as to rival fire in their injurious effects. Millions of feet of merchantable timber were destroyed in spite of strenuous control efforts. Severe outbreaks in Montana threatened the valuable western white and lodgepole pine stands. Just why a relatively harmless insect should quite suddenly develop into a veritable scourge is considered one of nature's unsolved riddles. A rather severe outbreak of gypsy moth in the scrub oak forests of Cape Cod, Mass., was brought under control by dusting with poisons scattered from airplanes.

That blister rust, an even more formidable enemy of the pines than insects, threatens the magnificent forests of the Northwest was shown in the discovery of infected plants of the alternate host, *Ribes* sp. in Oregon and Washington. Little hope is offered that this destructive disease will not spread throughout the pines of all the Western States. As a means of delaying the rapid spread of the disease, a quarantine was put into effect on October 1 by the Federal Department of Agriculture, regulating the movement of five-leafed pines, currants and gooseberries from State to State. The eradication of *Ribes*, successfully used in Eastern forests as a method of control, naturally becomes quite impossible in the vast forest areas of the West.

Chestnut blight made rapid progress in its destructive march through the southern Appalachian forests, making certain the complete eradication of this valuable species in North America. Fortunate plantings established in far Western States may save the species from utter extinction. The loss of chestnut timber will be a serious blow, not only to the lumber, but also to the tanning industry.

**FOREST RESEARCH.** In authorizing the establishment of two forest experiment stations, one

in the Ohio-Mississippi valley area and the other one in the Pennsylvania-West Virginia region, Congress opened the way for the completion of a long-desired chain of research stations covering all the principal forest types of the United States. Under instructions of the Secretary of Agriculture, the recently created California Forest Experiment Station was located at Berkeley so that Federal officers might maintain close relations with State officials and profit fully by the work already accomplished. Privately endowed research stations continued to turn out constructive results during the year. For example, studies at the Harvard University Forest (*Harvard Forest Bul.* No. 8) indicated that mixed stands of white pine and hardwoods are more desirable and profitable than pure stands of white pine. The Forest Products Laboratory at Madison, Wis., actively pursued studies designed to aid the lumber manufacturers and consumers in reducing losses and making the most of raw materials. For example, a method was developed for steam bending chair parts which practically eliminates breakage; this has at times reached 25 per cent. As an aid to practical lumbermen, methods were devised for determining the moisture content of drying lumber, and grading rules were promulgated with a view to greater uniformity and less waste.

**MISCELLANEOUS.** A unique departure in forest seed sowing was inaugurated on the Hawaiian Islands when airplanes were used in planting rather inaccessible, burned-over lands. Rough estimates indicated that two men in airplanes accomplished as much in two hours as two men on the ground could have done in several years. British foresters formed a new society to be known as the Society of British Foresters and designed to maintain friendly and helpful relations between the widely scattered units of the Empire Forest Service. Foresters from various parts of the world took an active part in the International Congress of Plant Sciences held at Ithaca, N. Y., Aug. 16-23, 1926. Dr. Tor Jonson, of Stockholm, Sweden, presided as chairman of the forestry section. Representatives of 14 forest schools attended the second annual school conference held at the Forest Products Laboratory, Madison, Wis.

**BIBLIOGRAPHY.** Forest literature, as in the preceding year, was largely restricted to brief articles appearing in the public press and current periodicals. Among noteworthy books may be listed the following: H. H. Chapman, *Forest Finance* (New Haven, Conn., 1926); E. P. Stebbing, *The Forests of India*, vol. 3 (London, 1926); H. P. Brown, *An Elementary Manual on Indian Wood Technology* (Calcutta, 1925); F. Roth, *Michigan Manual of Forestry—II, Forest Valuation* (Ann Arbor, Mich., 1926, 2nd rev. ed.); S. J. Record and G. A. Garratt, *Boxwoods* (Yale Univ. School Forestry Bul. 14, 1925). See also AGRICULTURE, U. S. DEPARTMENT OF.

**FORMOSA or TAIWAN.** An island belonging to Japan off the Chinese province of Fukien; formerly belonging to China but ceded to Japan, May 8, 1895. Area, 13,888 square miles; population, according to the census of 1920, 3,654,398; estimated in 1923 at 3,976,098. There were 181,847 Japanese and 30,703 foreigners on the island in 1923. Capital, Taihoku, with a population of 180,362 in 1922. Other large towns are Tainan, Kagi, and Taichu. In 1923 there were

131 primary schools for the instruction of Japanese, with 731 teachers and 22,797 pupils; and for the instruction of the natives there were 467 schools with 5092 teachers and 215,108 pupils.

Formosa produces in commercial quantities nearly every tropical, subtropical, and temperate zone product. The island supplies all the world's oolong tea and produces nearly all the world's natural camphor. The sugar industry, however, is the most important. The production of raw sugar amounts to more than 1,000,000,000 pounds annually. Of the 156 sugar mills in operation in 1925, 44 were thoroughly modern plants. The entire output is shipped to Japan, with the exception of that used in local consumption and an inferior grade shipped to China. The production of tea averages about 21,000,000 pounds annually of which the United States takes about 10,000,000 pounds. The yield of rice was over 25,000,000 bushels and the 1924 banana crop was valued at \$5,000,000. The indigo, hemp, pineapple, grapefruit, papaya, peanut, bean, and cereal industries are also important producers. Gold, silver, and copper are mined in considerable quantities, and coal and sulphur are exported. The exports in 1924 were valued at \$126,837,088 and the imports at \$66,513,048. The revenues and expenditures have grown enormously under Japanese rule and at the present time amount to around 100,000,000 yen annually. The budget has never shown a deficit. Revenues for the fiscal year beginning April 1, 1926, were estimated at 99,775,266 yen, of which the taxes provide 15,554,947 yen. Government monopolies and receipts from the railroads and from other government property total 74,952,387 yen, and miscellaneous receipts provide the remainder. The principal expenditures are for communications and transportation, for the management of the government's monopolies, for forestry, and for maintenance of various administrative bureaus. The island is under a governor-general, who is supported by a well-organized force of Japanese police. Governor-general at the beginning of 1926, Takio Izawa.

**FORREST**, SIR GEORGE WILLIAM. British administrator and historian of India, died January 28. He was born at Nusseerabad, India, Jan. 8, 1846, and graduated from St. John's College, Cambridge University. He was a fellow of the Bombay University, and after reading for the bar became a member of the Inner Temple. In addition he contributed to the *Saturday Review* and other London journals, and in 1872 was appointed to the Bombay Educational Department. In 1882 he acted as census commissioner for Bombay and then was employed on special duty in connection with Bombay records. In 1887 he was made professor of English History at Elphinstone College, and in 1888 he was made director of records for Bombay. In 1891 he received a similar appointment for the Government of India, serving in this capacity until 1900. Sir George was made assistant secretary to the Government of India in 1898, secretary to the Government of India patents branch in 1894, and retired from official life in 1900, devoting himself to historical studies. Made a Companion of the Order of the Indian Empire in 1899, he was knighted in 1913. His publications include: *Selections from the State Papers Preserved in the Bombay Secretariat* (Home Series); (Mahratta Series); *Selections from the*

*State Papers Preserved in the Foreign Office Government of India, relating to Warren Hastings; The Administration of Warren Hastings* (1892); *Selections from the State Papers Preserved in the Military Department of the Government of India Relating to the Mutiny*, vol. i. Delhi; vol. ii. Lucknow; *The Administration of the Marquis of Lansdowne* (1894); *Sepoy Generals; Cities of India; History of the Indian Mutiny*, vols. i, ii and iii (1904-12); *Life of Sir Neville Chamberlain* (1909); *Life of Lord Roberts, K. G., V. C.* (1914); *Life of Lord Clive* (1918). Of his writings the best known are those in connection with the Indian Mutiny based in large measure on the original records.

**FORT MOULTRIE ANNIVERSARY OF.** See CELEBRATIONS.

**FORTY-EIGHT, COMMITTEE OF.** A political movement engaged in the organization of a national Progressive party whose platform is the abolition of the unjust economic advantage by possession of which a small group controls natural resources, transportation, industry, and credit. It is composed of representatives from the 48 States of the Union, from which it derives its name. The Committee operates by building up its party state by state, and delegates from the states so organized assemble at a national conference. The principles advocated are the public control of natural resources, public ownership of railroads, governmental banking, and equal rights for all citizens. A practice of "pamphleteering" is carried on during presidential and congressional elections, presenting through pamphlet service information relative to domestic economic issues which are subjects of controversy or contest. At election times it assists in the formation of progressive parties in the various States. During the year 1926 the Committee gave special emphasis to its educational programme, conducted by the National Bureau of Information and Education, its educational department, which was organized to broadcast the facts in respect to the issues requiring immediate attention so that the voters may be fully and correctly informed, and may have an opportunity to vote intelligently. Membership in the committee or party is on a dues-paying basis, and the amount of the monthly payment is left to the discretion of each enrolling person. A monthly magazine, *The Liberal*, is published at the national headquarters, 15 East Fortieth Street, New York. In 1926 the officers were as follows: J. A. H. Hopkins, chairman of the executive committee; Howard R. Williams, vice-chairman; Melinda Alexander, secretary; Charles H. Ingersoll, treasurer.

**FOSSIL MAN.** See ANTHROPOLOGY.

**FOSTER, BEN (JAMIN).** An American landscape painter, died on January 28. He was born at North Anson, Me., in 1852, and studied with Abbott Thayer in New York, and Luc Oliver Merson and Aimé Morot in Paris. His art was marked by French methods, and he was considered particularly successful in securing the mystic effects of early morning and evening, and moonlight nights. He was awarded a medal at the Chicago Exposition in 1893, and second prize for water colors at Cleveland in 1895. He received a bronze medal at the Paris Exposition in 1900, and a silver medal at the International Exhibition at the Carnegie Institute of Pittsburgh, in the same year. In 1901 he received a silver medal at the Buffalo Exposition,

and in the same year was awarded the Webb prize for his "Mists of the Morning" from the Society of American Artists in New York. Foster was also honored by the St. Louis Exposition in 1904, and in 1906 received the Carnegie prize of the National Academy of Design, and in 1908 was awarded the Inness gold medal from the same institution. From the National Arts Club in 1917 he received a gold medal, and in the same year the Altman prize of the National Academy of Design. He was chosen to the National Academy in 1904, and was a member of the National Institute of Arts and Letters as well as various other art organizations in the United States, Canada, and Europe. Among Foster's notable works are: "Lulled by the Murmur of a Brook," in the Luxembourg Gallery, Paris; "Sunset in the Litchfield Hills," in the Corcoran Art Gallery, Washington; "Birch Clad Hills," in the National Gallery, Washington; "Misty Moonlight Night," Brooklyn Institute Museum; "In the Connecticut Hills" (1914), Metropolitan Museum, New York; and other paintings in the Pennsylvania Academy, Philadelphia, the Toledo Museum, and private galleries. Later works, among them "Late Summer Moonrise," "Litchfield Hills," "Hazy Moonrise," and "From Hill to Hill" continued to show his interest in the mystic effects of dawn and twilight as well as of moonlight nights.

**FOSTER, STEPHEN C.** Anniversary celebration of birth. See CELEBRATIONS.

**FOWLER, GEORGE LITTLE.** American mechanical engineer and author, died at Brooklyn, N. Y., July 2. He was born at Cherry Valley, N. Y., Aug. 9, 1855, and graduating from Amherst College in 1877 entered the shops of the Miltmore Car Axle Company, Arlington, Vt., where he remained for three years. He then was engaged with the New York Central Railroad and various manufacturing companies until 1889, when he opened an office in New York City as a consulting engineer specializing in research work in the field of locomotive design, construction, and operation. In 1887 he was United States commissioner to the Railway Exposition in Paris, and in the same year became contributor to the *Railroad Gazette*, later becoming its associate editor, as well as associate editor of the *Journal of Railway Appliances*. He was a contributing editor to the *Railway Age-Gazette* and the *Railway Age* until 1919 when he joined the staff of *Railway and Locomotive Engineering*. He compiled and edited the *Locomotive Dictionary*, published in 1906 and 1909. He wrote; *The Car Wheel*; and also *Locomotive Breakdowns, Emergencies and Their Remedies*; and revised Forney's *Catechism of the Locomotive*. He was a member of various engineering railway societies, serving on important committees, and carried on a number of investigations both in the field and in special research. He made the first investigation of the lateral stresses imposed on car and locomotive wheels while in service, and also of resistance problems and gyroscopic action of motors on electric locomotives.

**FRANCE.** A republic of western Europe, lying between 42°20' and 51°5' N. latitude and 7°45' and 4°45' W. longitude. Capital, Paris.

**AREA AND POPULATION.** The area before the War was 207,054 square miles; total area in 1926, 212,659 square miles. The additions obtained under the Peace Treaty, and correspond-

ing to Alsace-Lorraine under the German Empire, comprise the new departments of Bas-Rhin, 1848 square miles; Haut-Rhin, 1354 square miles; and Moselle, 2403 square miles. According to the census of 1921, the population was 39,209,518, but not including the military and naval forces and the crews of merchant ships abroad. The exclusions numbered 192,973 in 1921. The population in 1911 was 39,604,992 excluding Alsace-Lorraine. The populations of the three departments obtained from Germany were according to the census of 1921, Bas-Rhin, 651,686; Haut-Rhin, 468,943; and Moselle, 589,120. The cities with a population of over 200,000 at the census of 1921 were as follows: Paris, 2,906,472; Marseilles, 586,341; Lyons, 561,592; Bordeaux, 267,409; and Lille, 200,952. The population of the devastated regions reduced from 4,654,000 to 2,075,000 during the War, had risen to 4,250,000 in January, 1924. The movement of population in 1925 was: Births, 768,983; deaths, 708,919; marriages, 353,167; divorces, 20,002.

As may be seen from the above statistics the population of France had declined between 1911 and 1921 despite the addition of the regions acquired from Germany. While this may be attributed in large part to the War, it is also caused by the falling birthrate of the country. This topic is continually before the public and all manner of methods have been advanced to successfully cope with the problem. For a discussion of the question consult the preceding YEAR BOOK.

**EDUCATION.** Elementary instruction is free and compulsory between the ages of six and 13. No later figures on primary instruction are available than those given in the preceding YEAR BOOK, when there were 3749 public and private infant schools with 315,632 enrolled pupils and 81,448 public and private primary schools with 3,973,033 enrolled pupils. Secondary education is provided by *lycées* supported by the state, colleges supported by the communes, and free schools supported by private individuals and associations. Higher education is provided by the state universities, special schools under the direction of the state and various private schools and faculties. The following tables from the *Statesman's Year Book* for 1926 show the seventeen universities of France with the date of their founding and the number of students on July 31, 1924, as well as the number of students by faculties for 1922, 1923, and 1924:

Universities	Students
Aix-en-Provence (1409) .....	1,735
Algiers .....	1,489
Besançon (1485) .....	347
Bordeaux (1441) .....	2,752
Caen (1432) .....	977
Clermont-Ferrand (1808) .....	437
Dijon (1722) .....	740
Grenoble (1339) .....	2,115
Lille (1580) .....	2,070
Lyons (1808) .....	3,288
Montpellier (1125) .....	2,081
Nancy (1572) .....	2,002
Paris (1150) .....	22,155
Poitiers (1431) .....	1,270
Rennes (1735) .....	2,164
Strasbourg (1567) .....	2,818
Toulouse (1230) .....	2,456
Total .....	50,891

\* Including 213 students in the two faculties of Theology.

<i>Students of</i>	<i>State institutions</i>		
	1922	1923	1924
Law .....	17,926	17,197	16,888
Medicine .....	9,424	9,218	9,551
Sciences .....	10,863	10,419	10,788

Pharmacy .....	1,759	2,085	2,287
Schools of Medicine and Pharmacy .....	2,417	2,400	2,127
Theology .....	218	217	218
Total .....	50,906	50,867	50,891

Other institutions dependent upon the ministry of public instruction include: Collège de France; Museum of Natural History (which gives instruction in the sciences); Practical School of Higher Instruction, with its seat at the Sorbonne, offering courses in history, philology, and science; École des Beaux Arts; and various others. Dependent upon the other ministries are various institutions of technical instruction, including schools of commerce, agriculture, mines, forestry, military and naval science, etc., and, finally, there are numerous technical schools of a lower grade dependent upon the ministry of public instruction.

**PRODUCTION, MINERAL RESOURCES, FORESTS, ETC.** Inasmuch as the French are great bread eaters, it naturally follows that the chief grain crop is wheat. The most productive regions of wheat are those to the west and the country around Paris. In the valley of the Rhone and the region to the southwest hard wheat is cultivated for the most part. Barley is produced especially in the west, above all in the departments of Côtes-du-Nord, Eure, and Ile-et-Vilaine and Mayenne. Rye is cultivated chiefly in Brittany; oats in the centre and the northwest; corn in the departments of Landes, Basses-Pyrénées, and Haut-Garonne. The potato is especially cultivated in the districts of the west and central regions; also in Brittany and in the departments of Corrèze, Creuse, Dordogne, Jura, and Haute-Loire, and the Vosges. The sugar beet is cultivated especially in the north where are found sugar refineries. The chief industry related to agriculture is wine production. The wines include the ordinary wines of the Midi, wines of the central regions and of the departments of Gers and Basse-Bourgogne. Then there are fine wines of the Bordelais and the famous wines of Burgundy. The yield of wheat in 1925 was 329,047,100 bushels; rye, 44,767,630 bushels, barley, 48,938,420 bushels, and oats, 330,300,000 bushels. In 1924 the production of wine was 1,806,000,000 gallons. On Jan. 1, 1925, the number of farm animals was: Horses, 2,859,400; mules, 192,930; asses, 279,640; cattle, 14,024,960; sheep and lambs, 10,171,520; pigs, 5,801,530; and goats, 1,376,510.

The chief manufactures are sugar, alcohol, and the textile industry. In 1924-25 the production of refined sugar was 750,280 metric tons. In the same year 2,223,800 hectoliters of alcohol were manufactured. The silk production amounted to 4,224,000 kilos valued at 75,989,000 francs.

Although mining activity is conducted along a wide variety of lines, iron ore and coal far exceed other lines of importance. The production of other mineral ores in 1924 was as follows: Lead, zinc, and silver, 39,900 metric tons; copper 118 tons; antimony, 3400 tons; gold 68,900 tons; manganese, 3700 tons; salt, 1,288,600 tons; and potash products, 1,059,000 tons. French production of iron ore in 1913 averaged

1,826,000 metric tons per month but at that time the Metz-Thionville Basin, which is now French, was in German territory. As this region then produced an average of 1,760,000 tons per month the total 1913 production in the present area of France averaged 3,586,000 tons. Post-war production in France steadily advanced from only 1,160,000 metric tons per month in 1920 to 2,416,000 tons in 1924. The 3,090,000 tons of iron ore raised in September, 1925, represents not only a considerable advance over pre-war French production but an approach to the total resulting from inclusion of the product from the Metz-Thionville Basin.

After a progressive increase during post-war years, French coal production in 1925 reached 48,033,000 metric tons, an advance over the pre-war record of 40,844,000 tons in 1913. The Pas-de-Calais output showed a considerable gain over its record for 1913. A comparison of the production of 1913 with that of recent years in this field, the Department of the Nord, and the whole of France is given in the following table.

FRENCH COAL PRODUCTION

<i>Year</i>	<i>Pas-de-Calais</i> <i>Metric tons</i>	<i>Nord</i> <i>Metric tons</i>	<i>France</i> <i>Metric tons</i>
1913.....	20,575,000	6,814,000	40,844,000
1919.....	7,330,000	550,000	22,400,000
1922.....	19,950,000	4,430,000	31,910,000
1923.....	15,280,000	5,611,000	38,543,000
1924.....	18,822,000	6,826,000	44,955,000
1925.....	21,112,000	7,605,000	48,033,000

All the mines in the Pas-de-Calais region considerably increased their output in 1925, except those in the extreme westerly portion, where the extraction remained stationary. The rehabilitation of the Pas-de-Calais mines by 1926 might be considered complete—except for a few in Lens and Lievin—and their greater development more than compensates for the loss of production in the two sections. When the Lievin and Lens mines are rehabilitated, the annual production of the Pas-de-Calais fields would approximate probably 25,000,000 tons. In 1925 the importation was divided into 18,297,000 tons of coal, 5,002,000 of coke, and 1,264,000 of patent fuel. The largest contributor was England, which furnished 9,937,000 tons of coal, 10,000 tons of coke, and 168,000 tons of patent fuel—a decrease of 3,100,000 tons from its 1924 contribution. Germany was second on the list, followed by Belgium-Luxemburg, the Netherlands, and the United States. The coke industry had grown considerably during the year under review and by the end of 1926 coke production in Pas-de-Calais and the Nord was expected to approximate 4,000,000 metric tons. This amount of coke would require 5,500,000 tons of coal for its production, and furnish 165,000 tons of coal tar; 30,000 of benzol, 55,000 of sulphate of ammonia, and 700,000,000 cubic meters of gas.

The French forests have an area of more than 24,710,439 acres, or about 19 per cent of the entire country. About 17,297,308 acres belong to private interests; 4,942,088 acres to numerous communes, and 2,471,044 acres to the national government. The annual production for construction purposes was estimated at 8,500,000 cubic feet (3,604,000,000 board feet), and for firewood at 17,000,000 cubic meters. Considering the relatively small area of France, the wide diversity of trees is surprising. Among the most useful are the resinous varieties, such as the mountain

spruce of the Jura and the Alps, the larch of the Alps, the mountain pines of northern and central France, the maritime pines of southern and southwestern France, the Aleppo pines in Provence, and the black or Austrian pine in the Champagne region and eastern France. Among the hardwoods the oak is the most common.

The destruction of forests in the devastated area during the war was not so serious as had been previously estimated. In the war zone 410,193 acres of forest were completely destroyed. Over a forest area of 1,200,927 acres, about 25 per cent of the trees had disappeared. This represented a loss in annual production of about 400,000 cubic meters of construction timber. It was stated that outside of the war zone in the forests under government control about 4,000,000 cubic meters of construction timber and 1,000,000 cubic meters of firewood were cut in excess of the quantity which would have been removed under normal conditions.

No statistics are available in regard to forests belonging to private individuals. However, careful estimates would appear to indicate that considerably more than 2,000,000 cubic meters were cut in excess of the natural production. The important requirements of the devastated area for reconstruction purposes constitute the greatest danger to the recovery of the forests, as the high prices of timber tempt private individuals to sacrifice their holdings for large immediate profits. Up to the middle of 1926, about 4,000,000 cubic meters of timber were required for reconstruction purposes.

COMMERCE. According to the United States Bureau of Foreign and Domestic Commerce, no important change in the amount of the favorable trade balance of France for 1925 as compared with 1924, expressed in paper francs, is shown by trade statistics; but the development of the balance, especially in the latter half of the year, gave an unsatisfactory outlook for French foreign trade. Exports in 1925 had a total value of 45,413,555,000 paper francs and imports a value of 43,980,506,000 francs, with a balance of 1,433,049,000 francs in favor of the former, whereas in 1924 the figures had been 41,468,300,000 francs and 39,928,002,000 francs, respectively, with an export balance of 1,321,563,000 francs.

The month-by-month development of the trade, however, indicated a decided change in the situation beginning with August, 1925. Each month thereafter showed an unfavorable balance which tended to increase in amount. The unfavorable balance of 39,005,000 francs in August was multiplied to 467,140,000 in September, to 101,494,000 in October, to 380,876,000 in November, and to 817,112,000 in December. In view of the variation in the French franc, with a reduction in the average value from \$0.05237 during 1924 to \$0.04767 during 1925, statistics of weight offer a better basis for determining actual trends. The following table, on this basis, shows a divergent tendency in the import and export trade:

FRENCH IMPORTS AND EXPORTS, BY WEIGHT  
[In metric tons]

Items	1924	1925	Difference for 1925
Imports			
Foodstuffs .....	5,687,258	5,118,398	- 568,855
Raw materials ..	49,429,164	41,072,245	- 8,356,919
Manufactured articles .....	1,474,946	1,284,929	- 240,017
Total .....	56,591,368	47,425,572	- 9,165,791

Items	1924	1925	Difference for 1925
Exports			
Foodstuffs .....	1,683,802	1,386,681	- 247,171
Raw materials ...	24,101,708	24,607,542	+ 505,834
Manufactured articles .....	8,618,549	4,189,967	+ 576,418
Parcels post shipments .....	88,031	41,842	+ 3,892
Total .....	29,387,090	30,225,982	+ 838,892

\* Of which coal, coke, and briquettes comprised 31,517,010 tons in 1924 and 24,561,205 tons in 1925, with negative differential of 6,955,805 tons.

The imports fell off in weight in all the larger classifications. The decline in foodstuffs and manufactured articles was a result of a number of influences, such as decreased buying power and, in some lines, better yield from local sources. The decline in imports of raw materials for industry was partly due to the inclusion of Saar products in the domestic yield (formerly classed as imports) and partly to the better yield of domestic mines. Weights of exports showed a satisfactory increase. Taken on the general average, the ton of merchandise imported cost 700 francs in 1924 and over 900 in 1925, a rise of almost 30 per cent. In contrast, a ton of merchandise exported brought 1400 francs in 1924 and 1500 in 1925, an increase of 7 per cent.

In its import trade, which showed a tonnage decline, France found that prices adjusted themselves fairly promptly to the fall in the value of the franc; in the export trade, which showed a tonnage advance, the adjustment of the sales prices was much less marked. These disparities are still further emphasized, if comparisons be made for the latter months of the year only, when the value of the franc was declining rapidly. In the month of December, when the fall of the franc was particularly rapid, imports increased in value by more than 1,500,000,000 francs, as compared with the same period of 1924, or approximately 40 per cent. On the other hand, the fall in weight in this period was about 18 per cent. The average ton of imports cost 800 francs in December, 1924, and 1350 francs in December, 1925, an increase of about 70 per cent, whereas the average value of a ton of exports increased only 15 per cent. Currency depreciation therefore has not only disturbed the interior finances of the country, but has had a very unacceptable influence on the balance of trade. Under such conditions the greater the stimulation of exports, the greater is the actual loss to French manufacturers, and the apparent advantages of increased exports seem to be far outweighed by accompanying disadvantages.

As a whole, the trade balance of 1925 was not encouraging. The excesses of export over import values for the first seven months were later replaced by unfavorable items. The favorable balance of almost 3,250,000,000 francs at the end of July fell to a little over 1,400,000,000 francs at the end of the year. While total imports rose markedly in value, they showed a great falling off in weight. Exports showed a less marked rise in value with a marked increase in weight. Analysis of details was not more encouraging, especially in the case of those raw materials which France must perforce obtain from abroad. Sales prices in foreign trade had not been adjusted to replacement costs. French industry appeared to be in the position of the

merchant who sells more merchandise than he receives without getting in at the same time equivalent assets in hard cash, and thus "eats up his capital."

The position was not new for countries whose currency had a steady fall in international exchange. Though the current activity of French industry was fairly well maintained, less raw materials were being imported. Apparently, stocks of raw materials and of goods manufactured therefrom were not being kept up—a condition, which, if it continued, must result in forced purchase of increased supplies or a slowing down of the rate of production. The economic importance of stabilization of the currency and of adjustment of sales prices to replacement costs, rather than to the nominal purchase prices of material, is amply demonstrated by the apparent strength but actual weakness of the French foreign trade position in 1925.

**RECONSTRUCTION.** The total expenses of reconstruction and restoration that the French government had engaged itself to meet, amounted at the close of 1925 to 102,000,000,000 francs, according to a report given out by the Statistical Society of Paris. Of this amount, 85,000,000,000 francs represented claims of private firms and individuals, comprising 25,000,000,000 francs for damage to industrial property, 20,000,000,000 francs for damage to farming property, and 40,000,000,000 for damage to residences and other properties. The remaining 17,000,000,000 francs apply principally to interest charges, to reconstruction of state properties and railways, and also to expenses of government reconstruction bureaus.

At the end of 1925 the total government funds actually spent to meet property losses or damages amounted to 79,000,000,000 francs. On that date 53,165 kilometers of highways had been repaired out of the total of 58,697 that were damaged during the war, and 2361 kilometers of local railway lines had been restored to operation from the 2408 destroyed. Of the 17,616 public buildings destroyed or damaged, 11,343 had been rebuilt and 2856 provisionally repaired. Of 8344 constructions of various sorts connected with highways, railroads, and waterways, 6749 had been restored at the end of 1925.

Out of the 1,923,479 hectares of land requiring restoration, 1,815,449 hectares had been again placed under cultivation at the end of 1925. Of the 866,844 buildings destroyed or damaged, 521,913 had been rebuilt or repaired, of which 364,406 represent residences or business quarters. In addition, 42,400 temporary homes were erected from material left over at the end of the War, and 108,901 temporary wooden homes built during or since the War were still serving as residences. Of the 9332 destroyed or damaged factories, employing not less than ten workers each, 88 per cent (8228) had again been placed in operation. The pumping and other work in the mines had been completed in the departments of Nord, Meurthe-et-Moselle, and Meuse, but considerable work remained to be done in the Department of Pas-de-Calais.

**FINANCE.** The French budget for 1926 in its final form showed considerable deviation from its original status as presented by Finance Minister Caillaux in the summer of 1925, as well as from the final budget for 1925. Discussion of the

1926 budget in the Senate and Chamber of Deputies brought about a realization that the increases in expenditure shown in the first draft were not sufficient to cover all requirements; consequently the total had to be raised and the receipts strengthened accordingly. Moreover, many of the new taxes proposed in the first draft were not enacted, so that it became necessary to create new sources of revenue in order to produce the required result. The budget of 1925 represented an advance over previous budgets in that a number of previously extra budgetary expense items were included in its scope, but further progress in this direction was necessary to make the budget all inclusive.

In presenting the first draft of the 1926 budget the Minister of Finance announced that the aim of the administration was to have a budget based, as to receipts, on tax proceeds alone and to leave receipts and expenditures in "irreproachable balance." Many changes were introduced before final passage of the budget at the end of April, 1926, but the same idea was adhered to, and the budget, as nearly as possible, covered all types of expenses by revenues from sources other than borrowing. The principal exception to this rule was the amount in "national defense" bonds and government rentes issued for reconstruction and war damage claims in lieu of cash payments. These are not included in the budget estimates, not being calculable in advance; in recent years they have been diminishing, but even in 1925 they exceeded 3,000,000,000 francs.

By the issue of these securities, direct cash payment was avoided, but the debt service was thereby increased and, in the case of the defense bonds, maturing in one year or less, redemption was required. The net result of the changes from the 1925 budget to the preliminary draft and thence to the final budget for 1926 is shown in the following table:

SUMMARY OF FRENCH BUDGETS FOR 1925  
AND 1926  
[In paper francs]

Item	1926		
	1925 (final)	(first draft)	1926 (final)
Revenues	33,150,844,678	36,172,091,077	37,498,739,468
Expenditures	33,137,180,618	36,039,407,619	37,338,389,202
Surplus	13,664,060	132,683,458	160,350,266

Receipts from direct and indirect taxes in the 1925 budget were valued at 25,381,000,000 francs, or 76½ per cent of total revenues, and income from monopolies and state services accounted for 2,640,000,000 francs, or 8 per cent of the total budget. In the 1926 budget as finally passed tax receipts were raised to 30,379,000,000 francs and constituted 81 per cent of the total; monopoly receipts were raised to 3,509,000,000 francs, and comprised 9.3 per cent of the total. The proportion derived from these normal sources was thus raised from 84.5 per cent in 1925 to 90.3 per cent in 1926.

The extensive changes introduced in various categories of receipts and expenditures in the 1926 budget, as compared with that for 1925, are shown in the following table:

**FRENCH BUDGET FINAL ESTIMATES FOR 1925  
AND 1926**  
[In million paper francs]

<i>Budget item</i>	<i>1925</i>	<i>1926</i>
<b>Revenues</b>		
Direct taxes .....	5,923.2	6,558.5
Taxes assimilated to direct taxes .....	248.5	870.6
Registration taxes .....	5,200.5	5,875.7

\* Combined with Ministry of Finance in 1926 budget.

While the budget itself indicated that all expenditures set forth were covered by revenues and while considerable progress had unquestionably been made toward meeting national obligations with national resources, it was universally recognized that the French financial problem was not completely solved by the 1926 budget. Reparation receipts were excluded from the budget so as to be available for payments on French foreign debts, but no provision was made for payment of the claims based on war damages in the devastated regions except by issuance of securities, which represent a further increase in the public debt. The yield of the new tax levies was problematical and might possibly be considerably less than estimated and many classes of expenditures would apparently exceed estimates.

As placed before the Chamber and Senate finance committees on Oct. 12, 1926, the 1927 budget proposals showed estimated receipts of 39,960,000,000 francs, and expenditures of 39,383,000,000 francs, leaving a nominal surplus of 577,000,000 francs. The figures approved by the Chamber finance committee on November 5 showed a revenue of 39,059,000,000 francs and expenditures of 39,260,000,000 francs, leaving a surplus of 699,000,000 francs. Generally the bill was well received, as representing a more complete effort to face all expenditures and eliminate supplementary appropriations. Some misgivings were felt, nevertheless, over the lack of a definite forward-looking financial plan and of provisions for any possible crisis in the floating debt situation.

**SHIPPING.** The trade of the French commercial maritime ports during 1925, compared with 1924, was characterized by an increase in the gross tonnage of vessels arriving and departing, by a considerable decline in the tonnage of the merchandise discharged and a slight increase in tonnage loaded, and by a rather marked increase in the number of passengers embarked and disembarked.

**TRAFFIC OF FRENCH COMMERCIAL MARITIME PORTS**

<i>Classification</i>	<i>1924</i>	<i>1925</i>
<b>Arrivals:</b>		
Number of vessels .....	59,402	56,625
Gross tonnage .....	53,640,310	55,324,700
Tons of merchandise discharged .....	35,048,141	80,633,333
Number of passengers .....	1,605,818	1,663,778
<b>Departures:</b>		
Number of vessels .....	59,412	56,440
Gross tonnage .....	53,555,796	55,254,618
Tons of merchandise loaded .....	10,154,028	10,839,089
Number of passengers .....	1,530,708	1,738,651

The French merchant marine tonnage at the beginning of 1926 aggregated 3,350,000 as against 3,400,000 last year, according to a report by the Comité Central des Armateurs de France. The falling off is explained to a great extent by the gradual decline of the sailing fleet. During the year 80,000 tons of sailing vessels were demolished or sold abroad, 140,000 tons of steam vessels left the French flag, while 180,000 tons were added by purchase and construction.

**RAILWAYS.** The aggregate gross receipts of the principal French railways in 1925 were 1,028,806,000 francs higher than in 1924, but as rates increased considerably during the period under consideration the gain was not indicative of increased profit. In March, 1924, passenger fares were raised by almost 50 per cent and freight rates by 12.5 per cent; in March, 1925, internal freight rates were again increased by 3.45 per cent.

<i>Railway</i>	<i>Kilometers in operation</i>	<i>Gross receipts in thousand francs*</i>		<i>Gain in 1925</i>	
		<i>1924</i>	<i>1925</i>	<i>Thousand francs</i>	<i>Per cent</i>
État .....	9,064	1,285,994	1,442,093	156,099	12.04

Alsace-Lorraine .....	2,266	735,551	784,476	48,925	6.51
<b>Total .....</b>	<b>41,680</b>	<b>8,740,873</b>	<b>9,769,679</b>	<b>1,028,806</b>	<b>11.64</b>

\* The franc exchange rate for 1925 averaged 4.77 cents.

The operating deficit of these railways in 1925 was estimated at 700,000,000 francs. This figure was further increased by 215,000,000 francs, representing capital charges for the payment of interest on foreign loans in the currency of the creditor nations.

In November, 1926, the United States Bureau of Foreign and Domestic Commerce reported that the electrification of the Paris-Orleans railroad line was progressing steadily. On October 6, ten passenger trains were driven by electric power between Paris and Les Aubrais, a distance of 123 kilometers. Before the end of 1926, electric traffic was to be complete as far as Vierzon, and the power for the route to this point was to be supplied by the hydroelectric plant of Eguzon, representing a total installed power of 50,000 kilowatts. The electrification programme of the Paris-Orleans line included the Paris-Brives section of the Paris-Toulouse line and the two transverse lines, St. Sulpice-Gannat and Brives-Clermont.

**ARMY.** The army is divided into two forces, the metropolitan and colonial, both under the war ministry. There are three divisions of the metropolitan forces: The active army, reserves, and territorial army. The active metropolitan army on a peace basis in 1925 numbered 419,176, inclusive of an air force of 32,886. Service in this army is compulsory but liberal exemptions are allowed. Enlistments are regulated by the law of April 1, 1923. In November, 1924, a plan was adopted to reduce the service in the active army to one year, but it was not put in force during 1925. The colonial army is distinct from the metropolitan army and is made up partly of white troops and partly of colored troops. In 1925 the white troops numbered 43,276, the Foreign Legion numbered 10,000, and the colored troops, 212,597, making with the metropolitan army a total peace strength of 684,039. The reserves and the territorial army are divided into units corresponding to those of the active metropolitan army. The gendarmerie, a police force recruited from the army but concerned with civil functions, numbered 21,700 in 1925, about half of whom were mounted. See **MILITARY PROGRESS.**

**NAVY.** For an account of naval conditions in France see **NAVAL PROGRESS.**

**GOVERNMENT.** Under the French constitution, the president is the executive, assisted by a cabinet responsible to the Chamber. The legislative power is vested in a parliament or National Assembly, composed of a Senate and a Chamber of Deputies. The president, elected by the National Assembly by an absolute majority of vote for seven years, chooses his own cabinet; ordinarily, but not of necessity, selecting from among the members of the two chambers. The Senate is made up of 314 members aged not less than forty years, and elected by delegates for nine years; the Chamber of Deputies is made up of 580 members elected by direct popular vote for four years.

The president of the republic at the beginning of 1926, was Gaston Doumergue, elected June 13, 1924. The ministry appointed Mar. 10, 1926, was made up as follows: Prime Minister and Minister of Foreign Affairs, Aristide Briand; Justice, Pierre Laval; Interior, M. Malvy; War, Paul Painlevé; Marine, Georges Leygues; Finance, Raoul Péret; Colonies, Léon Perrier; Public Instruction and Fine Arts, M. Lamour-

eux; Public Works, M. de Monzie; Commerce, M. Daniel-Vincent; Agriculture, M. Jean Durand; Labor, etc., M. Durafour; Pensions, Paul Jourdain. For the political makeup of the Senate and Chamber of Deputies consult preceding **YEAR BOOK.**

## HISTORY

**SITUATION AT THE BEGINNING OF THE YEAR.** The year opened with Premier Briand in a death struggle with the six radical members of his cabinet over the financial proposals of Paul Doumer, who had succeeded M. Loucheur as Minister of Finance towards the end of 1925. Premier Briand stated that he stood firmly behind the Doumer programme and the radical members of the cabinet could either accept them or resign, in which case he would organize a new ministry with the aid of the Right Centre and would keep Doumer in the cabinet. His energetic tactics won the day for him and the radicals decided to remain in the cabinet and not attempt to support the Herriot-Blum scheme of balancing the budget, which these leaders had been working upon during December, 1925.

After the adjournment of the cabinet meeting, the following announcement was made: M. Paul Doumer submitted to his colleagues the final text of his proposals. He declared his intention to submit shortly to the Chamber a project of reform of direct taxation conformable to democratic principles. These projects, however, cannot be immediately voted and applied so as to bring in revenue during the early part of 1926. And furthermore, it seems to the Minister of Finance that the increase in direct taxation voted Dec. 4, 1925, was so heavy that a further increase during 1926 is inadvisable. In these circumstances M. Doumer proposes to meet all the budget charges, the immediate needs of the Treasury, repayment of Bank of France advances and the creation of a sinking fund for amortization of the floating debt by the following measures: By further economies and improvement of tax collection by measures against fraud; by the creation of a tax on exports; by a tax on Bourse operations; by an increase in the price of tobacco; and an exceptional temporary tax on payments, the manner of the collection of which will be established by decree. Although M. Briand was successful in his cabinet skirmish, the strength of M. Herriot was further revealed when on January 12 he was reelected president of the Chamber.

Although Briand won over his cabinet to the Doumer financial scheme he was not as successful in the Chamber, where the committee on finance rejected the government measure and debated the project of accepting that of the Radicals. Theoretically Briand should have resigned at this point or at least ask for the resignation of Doumer but he did neither. Instead he submitted both finance plans to the Chamber without recommendations for either one. The debate on the two measures began on January 26 and both sides attacked the plan of the other with force and vigor. The speeches in favor of the Radical plan were all of the same tenor, i.e., make the rich pay their proportional share of the taxation and thus increase the revenues of the country. Doumer defended his plan on January 29 but failed to make much headway. After a debate of more than two weeks, the financial muddle was no nearer settlement than when the

debate began. On February 9 Premier Briand appeared before the Chamber and gave it one more week in which to take definite action one way or the other. If nothing was done at the expiration of that time he threatened resignation. Nothing practical resulted from this exhortation although Premier Briand forced a vote of confidence on February 12, on a minor portion of the finance bill, hinting that a dictatorship might follow his resignation. He won the vote of confidence by 327 to 182.

**RESIGNATION OF BRIAND.** After an all-night session of the Chamber, Premier Briand and his cabinet resigned on March 6. Of course the reason was the failure to solve the financial problems facing the government, particularly the declining franc, and the need of balancing the budget. The resignation followed a vote of 273 to 221 against a vote of confidence in the ministry over a question of the finance bill. On February 16 the Chamber had passed a tax bill which provided for only 1,600,000,000 francs instead of the 4,500,000,000 needed to balance the expenditures with the revenues. This bill as passed was neither the Doumer bill nor the Radical bill discussed above. On March 9, Briand, after declaring that he would not attempt to form another ministry, did that very thing, largely because he was more interested in the events at Geneva, for the time being, than he was in the internal conditions of his fatherland. For a discussion of the Locarno Pact and other international peace movements, see articles on LEAGUE OF NATIONS and PEACE AND PEACE MOVEMENTS.

This was the ninth ministry of France that Briand had headed and it must be said that it was one of the weakest, built as it was on a very precarious majority in the Chamber. It was reported that Caillaux had been offered the finance post but had rejected it because he felt that the finance minister should be the head of the cabinet. Instead of Caillaux, Raoul Peret became Minister of Finance, Louis Malvy, Minister of the Interior, Pierre Laval, Minister of Justice and Lucien Lamoureux, Minister of Education. The selection of Peret was not satisfactory to any of the Socialists and only to some of the members of the Radical-Socialists and the Right. Malvy was more or less of an enigma, no one knowing just where he stood politically and the Nationalists were particularly incensed because they blamed him for the Chemin des Dames holocaust in 1917.

The very first time the new cabinet met with the Chamber (March 18) it faced a crisis, but was rather unfortunately saved from defeat at the time by the fainting of Malvy at the conclusion of a bitter attack made on him by a Conservative deputy. The chief item in Peret's financial plan was a turnover tax, which was finally passed after almost an entire day and night of debate. The optimists thought enough money would be provided in this way to balance the budget. On the next day the import tariffs were raised 30 per cent horizontally on everything except paper pulp, wheat, sugar, coffee, cocoa, and parts of agricultural machinery.

The budget bill was finally passed on by the Chamber and the Senate on April 29. According to the figures of the budget the revenue was estimated at 37,535,000,000 francs and the expenditure at 37,287,000 francs, leaving therefore an estimated surplus of 248,000,000 francs. The service on the internal debt accounted for 58

per cent of this sum and the military 17 per cent. The paper balancing of the budget did nothing to stem the tide of the declining franc, many observers declaring that the balancing of the budget was only temporary and did nothing to remove the basic causes for the fluctuation of the franc. Caillaux pointed out that if the franc continued to fall, the budget would very shortly be unbalanced and he declared that France had not yet recovered her financial equilibrium and that if "the Chamber indulges in any of the political gymnastics by which it has distinguished itself in the last seven months the effect will be serious on the international value of the franc." In order to help the franc there was a movement on foot to collect subscriptions from wealthy persons and others who desired to contribute to help build up a sinking fund. Several millions of francs were gathered in this manner.

**THE MALVY AFFAIR.** As stated above Malvy was accused by the Conservatives in the Chamber of being responsible for the Chemin des Dames debacle of 1917, which came about largely as a result of the information the Germans had obtained concerning the offensive from a spy in French service. The whole affair revolved around Mata Hari, who was executed in October, 1918, because of espionage. She had letters in her possession written by a man in the French government whose name began with M and ended with Y. The natural assumption was that that man was Malvy and therefore he was responsible for the sad affair at Chemin des Dames. The charge against Malvy was never proved or disproved, but the mere fact that it was connected with his name was sufficient in the minds of many to make him guilty. As noted before Malvy suffered a breakdown in the Chamber as a result of the pressing of this charge against him by a Conservative member, from which he failed to recover and which caused his resignation from the cabinet. On April 19 a letter was published from Gen. Adolph Messimy stating that he was the author of the letters to Mata Hari and not Malvy. This served to clear the name of Malvy once and for all time in the minds of the French public.

**THE FALLING FRANC.** In the middle of May the franc had fallen to 36.17 to the dollar. On May 19, President Doumergue, Finance Minister Peret, and the directors of the Bank of France met to discuss the situation freely, and it was agreed to "use immediately, for the defense of the franc, all the resources of which public credit can dispose." Obviously the attempt was to be made to float a foreign loan, but efforts along this line were unavailable because the international bankers were chary of loaning money to France unless such action were preceded by drastic financial and monetary reforms, the chief of which was the stabilization of the currency. The only thing left was the so-called Morgan loan of \$100,000,000 which had been negotiated some time previously. Part of this was thrown into the breach and the franc made a temporary recovery. On May 29 Briand announced to the Chamber that the government had decided to exclude all other questions and concentrate all its activities to the saving of the franc. For this reason it appointed a committee of experts "to supervise the movement of the market and suggest all decisions useful to the defense of the national money." Despite these assurances the position of Briand and Peret was becoming more

and more precarious because of the demands by the Socialists and Radicals that France divorce herself from foreign bankers and try to settle her difficulties by herself. This attitude reflects the resentment in certain quarters in France at the failure to obtain foreign loans from British and American bankers due to financial instability within France itself.

**BRIAND'S TENTH MINISTRY.** The financial question again engulfed Aristide Briand and his ninth cabinet on June 15, when he handed his resignation to President Doumergue. The difficulty this time appeared to be between Peret and the Bank of France. The former wished to use the latter's gold reserve to stabilize the franc while the bank would not agree unless the franc were stabilized at a rate of twenty to the dollar. Briand evidently resigned in the hopes that he could form a "National Union" ministry comprising all parties, and one with absolute power to handle the financial situation without the interference of the Chamber. Poincaré was willing to join such a coalition cabinet if the government was given unlimited powers. The success of such a move depended upon former Premier Herriot, who said he would accept if M. Marin, the Nationalist leader, were not a member of it and if no undue powers were granted to the cabinet. This stand caused Briand to tell the president that he could not form a cabinet, whereupon President Doumergue asked Herriot to form one. Briand and Poincaré refused to join Herriot's cabinet and the Socialists said they would not cooperate unless he came out absolutely for a capital levy. Herriot was therefore compelled to give up the task of forming a ministry and it was again assigned to Briand. Poincaré's refusal to join the cabinet weakened Briand's position to a considerable extent, but nevertheless Briand formed his tenth cabinet on June 23 with the following members: Premier, A. Briand; Finance, Joseph Caillaux; Justice, Paul Laval; Interior, Jean Durand; War, General Guillaumat; Marine, Georges Leygues; Education, Bertrand Nagore; Public Works, Daniel Vincent; Agriculture, M. Binet; Commerce, Fernand Chapsal; Colonies, Leon Perrier; Labor, Jean Durafor; Pensions, Paul Jourdain. The new cabinet was not particularly well received, and differed from the former one chiefly in the person of Joseph Caillaux, who was looked upon as sort of a Moses to lead France out of the wilderness of financial distress. His first move was to demand stringent national economies and his second was to bring about a closer relationship between the government and the Bank of France.

Generally speaking the new policy of Briand and Caillaux revolved around the ratification of the American and British debts and the stabilization of the franc. Caillaux stated that the only way out was to establish foreign credit and the only way to do that was to make arrangement for the payment of outstanding loans and the establishment of financial security at home. He was sustained by a vote in the Chamber when he opposed outright the capital levy which was continually brought forward by the Socialists.

**THE RETURN OF POINCARÉ TO POWER.** On July 17, Briand and Caillaux presented to the Chamber a measure which would give the cabinet unlimited power to deal with the financial situation. That such power was imperative was indicated by the fact that the franc reached the low level of 42.49 to the dollar on July 16. The

Chamber by a vote of 288 to 243 refused the power desired by Briand and Caillaux, and there was nothing else for Briand to do but resign. Herriot and Marin voted against the measure, the former because he thought the financial question was one for the Chamber to decide and the latter because he was unwilling to place such important power in the hands of Caillaux. Two days after Briand's resignation Herriot succeeded in forming a ministry, with Anatole de Monzie as the Minister of Finance. The franc continued to fall and when Herriot met the Chamber and presented a capital levy, disguised in vague terms, he was defeated by a vote of 290 to 237. President Doumergue thereupon called upon Poincaré to form a coalition or National Union ministry. Ordinarily the task would be a hard one, but the financial situation was so pressing that political differences were forgotten for the time being and a cabinet was formed. The franc had reached its lowest level—almost 50 to the dollar—and it was necessary to use the remainder of the Morgan loan to meet the government's expenses for August.

The Poincaré government which took office on July 23 had six former premiers among its members. Premier, M. Poincaré; Foreign Affairs, Aristide Briand; Justice, Louis Barthou; War, Paul Painlevé; Marine, Georges Leygues; Education, Edouard Herriot; Labor, André Fallières; Interior, Albert Sarraut; Public Works, André Tardieu; Commerce, Maurice Bokanowski; Agriculture, André Queuille; Colonies, Francis Leon-Perrier; Pensions, Louis Marin. The appointment of this cabinet was well received in the Chamber by all parties except the Socialists and Communists and had an immediately salutary effect on the franc. By August 3 the premier had succeeded in rushing through both houses a tax bill which would provide 2,500,000,000 francs additional revenue in 1926 and 9,000,000,000 more in 1927. The increases came mainly from taxes on imports, railroad and motor transportation, and heavy increases in the taxes on foreign investments and direct inheritances. A few days later measures were passed to provide for a sinking fund of 49,000,000,000 francs in short-term bonds and authorizing the Bank of France to purchase coin in the public market for the backing of future note issues if the backing of future note issues if necessary.

Premier Poincaré made it clear that the question of the ratification of the American debt settlement would not come up for action during the remainder of 1926. Parliament adjourned on August 11 and left the cabinet to solve its difficulties as best it could. The press stated that Poincaré if he failed, could not blame parliament because it had ungrudgingly passed whatever measures he placed before it. The days of 1914-1918 were recalled when the government put into effect certain restrictions concerning bread and other foodstuffs consumed by the people. The first acts of the Poincaré government brought almost immediate results when measured by the rapid rise of the franc, the increase in taxes collected, and the export surplus for the months of July and August.

**SITUATION AT THE END OF THE YEAR.** On November 12, the Chamber of Deputies reassembled and one of its first acts was to give the Poincaré government a vote of confidence (365 to 207), although the Radical-Socialists and Nationalists nearly caused a cabinet crisis by at-

*Brown Brothers*

LEFT TO RIGHT: FRONT ROW—BRIAND, POINCARÉ, PRESIDENT DOUMERGUE, BARTHOU, AND MARIN; SECOND ROW—HERRIOTT, PAINLEVÉ, AND

tacks on the government. M. Marin, in particular, although a member of the cabinet which contained four leaders of the Radical-Socialists, bitterly denounced this group and called them impotent when in power and dangerous when out. Premier Poincaré was compelled to go before the Chamber and publicly disavow this statement of his minister of pensions, by stating that it was the talk of a private person and not of a member of the cabinet. Despite the vote of confidence in the government there were mutterings on all sides as to why the premier had not stabilized the franc, which was the only reason why he was placed in office with such extraordinary powers. Poincaré paid no heed to these mutterings and refused to state what the government intended to do with regard to stabilization, although he said that he had a plan which would be announced at the proper moment. He counseled delay and pointed to the steadily rising franc as evidence of the wisdom of that counsel.

**RELATIONS WITH ITALY.** During the last two months of the year relations with Italy were severely strained because of the so-called Garibaldi affair and the propaganda on the part of the Fascists for the return of Savoy to Italy. Colonel Ricciotti Garibaldi was arrested on November 4 at Nice on the charge of being in the employ of the Fascist government to foment anti-Fascist movements in France. As a result of his arrest and imprisonment, Federzoni, the Italian Minister of the Interior, resigned. Despite Garibaldi's denial it was conclusively proved that he was employed by the Italian government to stir up anti-Fascist propaganda so that it could be discovered by the Italian government and put down with great gusto.

**PEACE EFFORTS.** A most encouraging outlook is obtained by going over France's peace work accomplished by M. Briand during 1926. On March 2 and June 4, respectively, the Chamber and Senate ratified the Locarno agreements. Later Germany with the consent of France was admitted into the League of Nations; France and Germany signed their first commercial treaty since the war; Briand for France and Stresemann met at Thoiry on September 18 to discuss the possibility of a Franco-German rapprochement; Von Hoesch, the German Ambassador, subsequent to the Thoiry interview, continued the good work with Briand. A further vote for peace was cast by France when Minister of War Painlevé's plans for cutting down the army were approved. With the Franco-Spanish defeat of Abd-el-Krim came peace in French Morocco, and French efforts in Syria during 1926 had practically succeeded in reestablishing quiet among the troublesome Druses.

Even commercial peace was celebrated by the signing of the Franco-German accord which resulted in the creation of the air line between Paris and Berlin and vice versa, and the accord concerning the "European Steel Cartel" was the result of an agreement between France, Germany, Belgium, and the Grand Duchy of Luxembourg.

**FREE BAPTISTS.** See BAPTISTS, FREE.

**FRENCH CONGO.** See FRENCH EQUATORIAL AFRICA.

**FRENCH EQUATORIAL AFRICA.** A French possession in Africa on the Atlantic coast between the territories of the Belgian Congo and British Kamerun; comprising the region formerly known as the French Congo; stretching northward to the Bahr-el-Ghazel and Lake Chad, and bounded by the Congo and Ubangi Rivers in the interior. Area, 982,049 square miles; population, according to the census of 1921, 2,845,936, of whom 2932 were Europeans. Including the Kamerun territories the area is 1,048,538 square miles and the population, 4,345,936. The possession comprises the four colonies of Gabun, Middle Congo, Ubangi-Shari, and Chad. The Kamerun territories were ceded to Germany by France, in return for recognition of the French protectorate in Morocco. They were restored to France by the Treaty of Versailles in June, 1919. The boundary between French Equatorial Africa and the Anglo-Egyptian Sudan was fixed by an agreement signed Feb. 28, 1924.

Equatorial Africa is very rich in natural resources, but for the most part they are undeveloped. There are about 30,000 square miles of tropical forests extending to the Gabun coast containing many species of valuable timber. Palm oil and wild caoutchouc are the principal commercial products. Coffee is raised to some extent. Livestock includes cattle, sheep, camels, horses, asses, and ostriches. Copper, zinc, and lead are to be found. The total imports in 1924 were valued at 47,020,355 francs and the total exports at 44,216,246 francs. In 1925 the general budget for the four colonies balanced at 21,255,845 francs. The revenues are made up of import, export, and excise duties, navigation fees, and certain semi-direct taxes. The colonies are under a governor-general whose headquarters are at Brazzaville, but each colony is locally governed by a lieutenant-governor, aided by an administrative council. Governor-General, at the beginning of 1926, R. Antonetti, appointed 1924.

**FRENCH GUIANA, gé-i'na.** A French colony used also as a penal settlement, on the northeast coast of South America. Area, about 34,740 square miles; population at the census of 1921, 44,202. Cayenne, a seaport town, is the capital with a population in 1921 of 10,146. The population figures do not include the number in the penal settlement of Maroni, the floating population of miners, French officials, or native tribes. The latest available education statistics showed a school population of 2720, exclusive of Maroni, which had 208. The extensive forests are rich in timber of commercial importance. Although agriculture is not engaged in on a large scale the following products are raised: Cacao, coffee, gutta percha, indigo, maize, manioc, rice, sugar cane, and tobacco. The chief occupation is placer mining for gold. Other minerals produced are silver, iron, and phosphates. The total imports in 1924 amounted to 43,600,000 paper francs and the total exports to 42,200,000 francs. The chief articles of export were gold, rosewood, essence, various timbers, phosphates, cacao, balata, and hides. The budget, which amounts to approximately 7,000,000 francs annually, must be partly met by subsidies from the home government. The colony is under a governor, who is aided by a privy council and by a council-general elected by French citizens in Guiana, and is represented in the French parliament by one deputy.

**FRENCH GUINEA.** A French colony on the west coast of Africa between Portuguese Guinea and the colony of Sierra Leone. Area, about 89,436 square miles; population, estimated in 1924, 2,026,321, including 1885 Europeans, of whom 1083 were French. Capital, Conakry. The chief products are palm oil, palm nuts, gum, rubber, millet, rice, and coffee; experiments have been made in the cultivation of bananas, pineapples, rubber trees, etc. The last livestock census showed 430,000 cattle, 76,718 sheep, 103,817 goats, 2600 horses, and 500 asses. Some gold is found in the colony. The imports in 1924 were valued at 68,804,834 francs and the exports at 38,685,775. The chief exports were: Rubber, cattle, ground nuts, hides, wax, wool, and palm-kernels. In 1923, 337 vessels entered and 327 cleared. The budget for 1924 amounted to 16,075,237 francs. The colony is under the governor-general of French West Africa (q.v.).

**FRENCH INDIA.** The name given to the group of French dependencies in India, of which the chief is Pondichéry. The area of the five colonies is about 196 square miles and the collective population in 1924 was estimated at 277,516. The five dependencies with their estimated populations in that year are as follows: Pondichéry, 177,483; Karikal, 56,922; Chandernagor, 26,941; Mahé, 11,455; and Yanaon, 4715. In 1924 the government maintained 61 primary schools and three colleges with 308 teachers and 10,305 pupils. In 1925 the budget balanced at 2,806,230 rupees. The chief crops are paddy, rice, sugar, cotton, manioc, cacao, coffee, and groundnuts. There are at Pondichéry three cotton mills and at Chandernagor one jute mill; the cotton mills have, in all, 1662 looms and 68,631 spindles, employing 7975 persons. The total imports for all the dependencies in 1924 amounted to 37,400,000 francs and the total exports to 44,300,000 francs. French India has 43 miles of railway. The dependencies are under a governor whose headquarters are at Pondichéry, and an elective general council; they send one deputy and one senator to the French parliament.

**FRENCH INDO-CHINA.** A region in south-eastern Asia, comprising the French colony of Cochin-China, and the protectorates of Annam, Cambodia, Tonking, and Laos, as well as Kwang-Chau-Wan, which has been leased from China, and the district around Battambang, which was ceded by Siam. Total area, about 274,385 square miles; population in 1924, 19,636,137, of whom 26,137 were Europeans (excluding military forces). The native Annamites constitute about three-fourths of the population. Capital, Hanoi, with a population of approximately 115,000. Other important cities are: Cholon, Bindinh, Saigon, Penom-Penh, Hué, Vien Tiane, and Haifong. The region of which Saigon is the centre is chiefly agricultural, being one of the greatest rice producing areas of the world, but fisheries along the coast and along the lakes are of some importance. Haifong is the centre of a region devoted to agriculture, mining, and manufacture. A third district around the port of Tourane produces chiefly cinnamon, sugar, and tea. In 1923 an irrigation system was completed reclaiming 45,000 acres on which two rice crops a year could be produced.

The mineral resources of French Indo-China include coal, zinc, tin, lignite, antimony, and wolfram. The forest reserves are very important

but suffer from inefficient exploitation. The import trade in 1924 was valued at 2,024,000,000 and the export trade at 2,233,500,000 francs, both of which represented important increases over the preceding year. The important increase in trade values in 1924 is attributable mainly to higher prices. Exports of rice, valued at 1,105,371,000 francs, represented a big advance over 1923. Other exports showing notable expansion were rubber, tea, wood, cement, zinc, and ores of tin and wolfram. For the first nine months of 1925 the imports from France were valued at 503,300,000 francs and the exports from the same country at 423,100,000. The general budget for 1925-26 was estimated at 77,606,000 piasters, 65,742,810 being for the ordinary budget and the remainder for the extraordinary budget. The total of the local budgets (for the component parts of French Indo-China) was 48,978,053 piasters. The combined budgets of Indo-China therefore amounted to about 136,000,000 piasters—from which must be deducted 7,890,000 piasters, the subvention allowed the local budgets from the general budget. Of the total for the general budget, 19,760,000 piasters are for public works, 1,100,000 piasters for education, and 291,400 for medical assistance. At the end of 1924 the total length of railway line was 1288, about two-thirds of which belonged to the government. Indo-China is under a governor-general and a superior council which acts through a permanent commission, and at the head of each state is a resident superior, with the exception of Cochin-China, which is directly under the home government. Governor-general at the beginning of 1926, Alexandre Varenne.

**FRENCH LANGUAGE.** See **PHILOLOGY, MODERN.**

**FRENCH LITERATURE.** The year 1926 in French literature witnessed the continuation of some of the discussions started in 1925: The claims of Paul Valéry, the new member of the French Academy, to combine art with intellectual thought, scientific precision with æsthetic emotions (a little in the manner of Poe)—to which discussion he himself contributed in publishing a new edition of his poems *Charmes*, and his philosophical essays in *Variété*, in *Rhumbs*, and in *Le Serpent*. Then there was the discussion about "Poésie pure" started by Abbé Brémont (see **YEAR BOOK** for 1925), and which never diminished in alertness, as witnessed in numerous articles published by the two chief antagonists, Brémont and Paul Souday, in the *Revue littéraire* and in *Le Temps*, also in separate publications, especially Brémont's *Poésie; pure*, and *Prière et Poésie*; one of the last articles of the year was by Souday in the *New York Times Book Review*, of Dec. 19, 1926.

The most sensational episode of the revival of religious discussions among men of letters was the conversion of the wildest free lance, the young Jean Cocteau; the *Lettre* in which he explained his step to another convert of note, Jules Maritain, was published and widely discussed, as was also the answer by Maritain (publisher: Delamain). In this connection it is well to recall also that the most discussed novel of the year was also one centring around a religious problem, viz. Bernanos's *Sous le Soleil de Satan*. Still another continuation was that called "*La Crise de l'Action Française*"—that is to say, the split in the ranks of the so-called "camelots du

roi" of whom Ch. Maurras and L. Daudet were the chiefs; G. Valois took the lead of the dissenters and formed what has been assimilated to the Fascist Party in Italy. In connection with this sensational feud, Valois published *La Révolution nationale* (*Nouvelle librairie nat.*), and Dimier, *Vingt ans d'Action Française, et autres souvenirs*. It must be added that the Pope added to the confusion when he condemned his royalist supporters of the "Action Française."

The anarchy that seems to prevail in post-war literature induced Ernest Tisserand to send out a syllabus to the best known authorities about what he called "Les Maladies de la littérature actuelle"; the answers came out in the periodical *Les Marges*; the five diseases would be: The literary prizes; the advertising; the literary cliques (*boutiques littéraires*); intrigues of all sorts; use of the most abject vices to write sensational books. That the "enquête" was timely may be inferred from two facts pointing in two opposite directions; one of the worst scandals of immoral literature was brought about by the play *La Carcasse* (see under *Theatre*); and one of the most coveted Prix Littéraires, the "Prix Femina," went to an extremely charming and delicately idealistic novel, *Prodige du cœur*, by Charles Sylvestre—which may be a sign that in the novel at least some are beginning to feel tired of the eccentric, nerve-racking books.

POETRY. Poetry is always popular—with poets. Of this year's crop we need mention particularly only a few names: A posthumous volume of Verhaeren, *Chants en forme de dialogues*; then a new collection by Claudel, *Feuilles de Saints*, about real Catholic saints, like St. Louis, Ste. Cécile, Ste. Geneviève, and men who were "saints" at least to the poet, like Verlaine, Dumesnil; a volume by the "laboureur-poète," Philéas Lebesque, *Chansons de Margot* (coll. Hérissou), now sad or cheerful, now tender or bitter, but always quite unconventional. The Grand Prix de Poésie went to Jacques Noir (a tax-collector of Poitou) author of *Ames inquiètes, Malédictions*, and this year of *Heures profondes*; and M. Zamacois was awarded the Prix de Poésie for a poem on *La Tombe de Loti*. One ought to call attention to an edition of the *Œuvres poétiques* by Ch. Adolphe Cantacuzène (Perrin). Of the new innumerable collections of verses, one may quote—almost at random,—Emile Despax, *La maison des Glycines*, Pierre Gusman, *Les Heures dorées*, Noël Garnier, *Le mort mis en croix*, (Prix Catulle Mendès) and perhaps a little volume with many reminiscences of America, by Renée Jardin, *Nostalgies*.

People looking for interesting attempts to renew poetic inspiration will do well to follow the publications of the "Collection des poètes du Pigeonnier" (St. Félicien-en-Vivaraix); the presentation is quite worthwhile in itself, types, illustrations, etc.; two of the recent volumes are Fr. Angély's *La métairie de Jean d'Olagne suivie de Poèmes divers, et d'Équinoxe*, and Gabriel Faure, *Pages lyriques*. We ought to mention a new edition of the well known Walsh, *Anthologie des Poètes Français Contemporains*; also a new work; M. Tresch, *Evolution de la Chanson française savante et populaire*, vol. I, *Des Origines à la Révolution*. A word has been said above on the continuation of the "Querelle de la Poésie pure," started by Abbé Brémond, of the French Academy (see 1925 YEAR BOOK.)

THEATRE. The situation is not viewed with

much optimism by Dubech, perhaps the most influential critic of the stage in France to-day: "During the last theatrical season, a theatre specially founded for the young authors had to shut its doors very soon; the Vieux-Colombier is closed; the Atelier is half asleep; the Comédie des Champs Elysées is open only for the plays of M. Romains and his family. Pitoeff of the Théâtre des Arts complains about the scarcity of good French plays. The Comédie Française is not a laboratory for coming playwrights; just the other way, and perhaps it is well that it should be so. At the Odéon, Gémier, whose nomination as director had raised the highest expectations, has not given one good play or revealed one new author. . . . The private associations which had soon after the war called attention to good men like Bernard, Fauré-Frémiet, Farigot, have given nothing solid for two or three years. . . . All this is not very comforting. But after all society is in a bad way; it is not quite strange that literature should not be very healthy" (*Revue Universelle*, August). The facts bear out a good deal of that statement. Things are rather dull—or traditional, like the classic plays given in Carcassonne and in the arenas in southern France; the Théâtre populaire of Bus-sang giving the annual representations; Jacques Copeau continuing his "school" in Burgundy (*Les copiaux*). . . . One of the most alive theatrical organizations seems to have been this year again the "Compagnons de Notre-Dame," directed by H. Ghéon, and who give religious plays, this year chiefly Ghéon's *Bergère Germaine*, the story of a girl now an object of veneration in southern France, a martyr to the harsh treatment of a cruel stepmother. In connection with this attempt at a revival of the religious theatre, one must mention the book by the famous Gaston Baty, *Le masque et l'Encensoir, Introduction à une esthétique du Théâtre*; the author considers that only plays of the religious medieval type are fit for representation, while he excommunicates even Corneille, Racine and Molière. (Baty was for the last years the stage director of the "Salle des Champs Elysées," and his conversion was as little expected as that of Cocteau.)

The "scandal" of the *Carcasse*, the play by Denys Amiel and André Obey, offered at the Théâtre Français, was the most sensational episode of the year. It depicted the unsavory affairs of a general in the French army and of his family, and Prime Minister Briand brought the affair before the French Chambers considering it an unpatriotic play, and thus forcing the Théâtre Français to withdraw it.

Of the older playwrights that offered plays we mention especially Maeterlinck with an unpublished *La puissance des morts*; Lucien Descaves in *Le cœur ébloui*, in which he shows the awakening of the emotions of love in young men, students in the Latin Quarter; Brioux gave a long bourgeois play in his usual vein—*La famille Lavclotte*, a sort of 20th century Benoiton family; François de Curel, *Le viveur et le moribond*, a powerful picture of a man who had been a fine officer during the war, and became a total moral wreck in after war conditions. Bernstein's *Félix* betrays the old time lover of violent drama with however a new note, that of real pity for the victims of human passion, greed and egoism. Paul Fort has another of his historical plays, *Les Compagnons du Roi Louis*. Croisset et Flers

have their usual success with a fancy play, *Le Docteur Miracle*—who has found the secret of living a thousand years, and the authors imagine the consequences; the same authors score in the operetta, *Le Diable à Paris*. For several years Jules Romains had been quite fortunate in his stage ventures, especially *Knock*; his *Dictateur*, in which we see a former socialistic leader turned into an autocrat of the worse sort simply because he was now in a position to command, proved rather disappointing to the public. Another play, at the end of the year, shows Romains apparently turning away from his "unanimism," or mob psychology; his *Jean de Maufranc* feels horror for everything that reminds of association with fellow men, in public or in private life.

It was one of the younger authors who carried away the greatest praise, Bourdet, with *La Prisonnière*; in Paris as in New York where it had a long run too (under the title *The Captive*) it was felt that here was a clear case when a delicate and unsavory subject, Lesbianism, had been treated without the slightest attempt on the part of the author to coin money by sensational appeal to low instincts, but when earnest art had rendered the terrible acceptable as it had so often in the classical tragedy of the Greeks.

Fairly but not fully successful were other men of the younger generation: J. Bernard, of the "école du silence" in *Ames en peine* has two lovers who during the whole play do not say a word to each other while the play has that love as its theme; entirely in keeping with his method is the dramatization by the same author of the supposed story behind the well known romantic *Sonnet d'Arvers*—the never revealed love of d'Arvers for Marie Menessier-Nodier. Jean Sarmant offered *As-tu du cœur?* Maurice Rostand, *La désertreuse*, a woman who deserts the poet she loves and who loves him because he needs drama in his life to make literature. Nozière scored with *Notre amour* at the Antoine theatre; Ch. Méré strikes once more the pathetic and realistic note with *Le lit nuptial*; Edm. Guiraud reforms a young snob in *Bonhomme du jour* (Odéon). Jacques Deval is very witty in *Dans sa candeur naïve*; J. V. Pellerin has a terrible satire on the bourgeois in *Têtes de rechange*; Jean Cocteau has a "pitrieries" on the story of *Orphée*. Jean Gaudement et Camille Cé publish four *Parces*. Sacha Guitry made another hit with a biographical sketch, his *Mozart*, repeated with great success in New York by Guitry himself and his wife Yvonne Printemps.

Among the most successful "reprises": Verneuil et Berr, *Azaïs*; Bataille, *L'animateur*; P. Wolf, *Secret de Polichinelle*; Kistemakers, *Les flambeaux*; Ancy, *La Dupe*.

Perhaps it might be worthwhile to mention here the memoirs of his youth that Maurice Donnay published under the title *Autour du Chat noir*. As a sort of short guide to the most recent playwrights in France the article by M. Wexner, *Le jeune Théâtre* (*Revue Mondiale*, May) will prove of interest.

NOVELS. The Grand Prix du roman went to Mauriac's *Désert de l'amour*, published in 1925; The Prix Goncourt went to Henry Deberly, for *Le supplice de Phédre*, a modern story raising the same problem as Racine's famous play (Deberly published the same year another story of human suffering, *Panloche*, a man condemned unjustly, then rehabilitated by law but whom

society refused to accept again in its fold): the Prix Femina went to a charming and touching story of love for an adopted child, *Prodige du cœur*, by Charles Silvestre (author also recently of *Cœurs paysans*). What is called the Prix Femina Anglais went to Marion Gilbert, for *Le Joug*. Prix de la Société des gens de lettres: Léon Lemonnier, *L'amour interdit*. Grand Prix d'Algérie: Gabriel Audisio, *Trois hommes et un minaret*. Prix Renaissance: Em. Zavie, *La maison des trois fiancées* (in after-war Russia). Prix des romanciers: Mme. M. Baulu, *Boulle et sa fille*.

Novels whose authors' names are sufficient guarantee of quality: Marcel Proust, *Albertine*, (the last of his manuscripts); A. Gide's *Les faux monnayeurs* (like Proust, Gide is more interested in abnormal humanity, which now goes so far that it seems to reveal the sad effect of war spirit on a senile mind); Colette, *La mort de Chéri*; Romain Rolland, *Pâques fleuries*, and *Mère et fils*, which is the first volume of a longer novel; Marg. Audoux, *De la ville au moulin*; J. H. Rosny, *Courtisane triomphante* and *Une jeune fille à la page*; Jacques Roujon, *Un homme si riche* (psychology of the parvenu, reminds one of Mirbeau's *Le chat*); Alex. Arnoud, *Le chiffon*; Elisa Rhais, *Mariage de Hanifa*; H. de Régner, *L'Escapade*; Louis Hémon, *Battling Malone*, *Pugiliste*.

Let us now take authors less known perhaps, but who were conspicuous in 1926: Easily the most widely discussed novel of the year was *Sous le soleil de Satan*, by a practically unknown writer, Georges Bernanos; it is the story of a priest who is possessed with the idea that he has a mission to fulfill among men, but often is at a loss to understand whether some of his actions are inspired by God, or whether he is misled by the Devil; there is even an apparition in flesh of Satan. Perhaps the present mental attitude of the reading public may have made part of the success—some trying to find in this mysticism a counterpart to the frequently morbid and low dispositions of present day thought (Proust, Gide, etc). At any rate the religious novel is no longer a rare phenomenon; see E. Bauman, *Le signe sur la main*; Louis Artus, *La chercheuse d'amour*; C. Mayran, *Hirc*. Not infrequently, moreover, is the religious note touched upon in novels that deal with the psychology of the present-day youth, the men of tomorrow.

Abnormal after-war conditions continued to solicit the attention; see among the excellent books, Bourget *Le danseur mondain*; Duhamel, *Pierre d'Horeb* (a young student of medicine); Blaise Cendrars, *Moravagine*; Gaston Rageot, *Vocation de Jean Douce*; Henri Pourrat, *Le mauvais garçon*; Jean Violliis, *L'oiseau bleu s'est endormi*; Jean Blade, *Le goeland*; Lucie Delarue-Madrus, *La graine au vent* (a girl); and last but not least, André Maurois's *Bernard Quesnay*; Fr. Mauriac's *La robe prête-à-porter*; and André Lamandé, *Les enfants du siècle*. Eccentric as one could expect it from a former Dadaist is *En joue*, by Philippe Soupault. Some novels have more decidedly the war as a background: R. Bazin, *Baltus le Lorrain*, H. Lenormand, *L'armée secrète* (spies during the war); Roland Dorgelès, *Partir*, travel adventures after the war with a love story interwoven; two are placed in Russia, Em. Zavie's *La maison des trois fiancées*, and Larrouy, *Leurs petites majestés*.

Quite a number of novels were about political conditions: a sharp satire on the League of Nations in Geneva is found in Marcel Rouff, *Sur le quai Wilson*. But the "political novel" attracting most attention was Giraudoux's *Bella* (with, it is rumored, Poincaré and Berthelot as central figures); see also Jacques Sindral's (pseudonym for Fabre-Luce) *La Victoire Mars*, (the hero of which is supposed to be Viviani); P. Dominique, *Le mercenaire*; M. Duplay, *La femme de César*; Lombard's *Le remords*, other "romans à clefs." Having no connection with the war, but of political significance, are two lighter satires: Thierry Sandre, *Panouille*; and R. Escholier, *Quand on conspire* (at the time of the coup d'état of Louis Bonaparte); while two others are of the sad, even gloomy type: M. A. Leblond, *Les Martyrs de la République*, and M. Betz, *Le démon impur*. Some other topics treated in novels are "movie" stars. René Clair, *Adams*, cinematographic impressions, dedicated to Ch. Chaplin; Abel Hermant's *Les Marionnettes* seems to contain a satire on little Coogan. Henry Bordeaux chooses the mountains as a background for his story *Jeux dangereux*; so does Ramuz, the Swiss author, in his new story *La grande peur dans la montagne*.

The sport novel par excellence this year was by H. de Montherlant, a young priest now very famous, who offers an enthusiastic defense of the bull fights in Spain, at the same time expressing his contempt for love, in *Le Bestiaire*. Pierre Benoit in his yearly novel *Alberte* tells the story of a mother who steals love away from her daughter (theme of Maupassant's *Fort comme la mort*); and a young American living in France, Julien (Green, attracted a great deal of attention by his story *Mont-Cinère* which tells of the hatred of a young girl for her avaricious mother. On the other hand the story of fatherly selfishness is told in the book bearing the cruelly ironical title *L'allée heureuse*, by Martial Picchaud (Prix Paul Flat). Henri Béraud, *Bois du templeier perdu*, is a striking tale of a town in Dauphinois from the 14th century to the time of the French Revolution. Edmond Jaloux, in *L'Âge d'or*, tells of the disappearance of the joys of the heart in the whirlwind of modern society. Light also and delicate but with a much more detached psychology is Fr. de Miomandre's *L'Amour de Mlle. Duvernier*.

Some originality is shown in Jacques Dieterlen's *Le roman de la cathédrale* (Strasbourg); by René Weck, in the historical *Le roi Théodore, roman corse*; by J. Kessel in *Les captifs* (captive of an illness, he revolts, decides to get out of life what he can anyway, and is disappointed, having missed his chance to make life worth while in suffering nobly); in J. Cassou, *Harmonies Viennoises* (the Vienna of 1827), by Emile Henriot in *L'enfant perdu* (God offers him a chance to live his life again, and he makes all over again the same mistakes); by Pierre Lasserre in *Le secret d'Abélard*; and by A. t'Stertevens in *Béni I, roi de Paris* (what Paris would be under a Bolshevist régime). La Fouchardière is never melancholy in *Didi, Niquette et Cie*. Bourget, G. d'Houville, Duvernois and Benoit have given a continuation of their *Roman des Quatre* (1924) in *Micheline et l'Amour*. A story in Languedocian patois, *La Bête du Vacarès*, by Joseph d'Arbaud, with French on the facing page, has been quite widely read; it deals with some mythological being,

a centaur, who is supposed to haunt the hill-sides among the grazing cattle.

**SHORT STORIES.** A posthumous volume by M. Barrès, *Le mystère en plaine lumière* (the first story has a characteristic title for Barrès, *La sybille d'Auvergne*); also posthumous, two stories by Boylesse, *Les deux romanciers* (one said to be the arch-pessimist Mirbeau, the other the optimistic Feydeau); Edouard Estaunié, *Le silence dans la campagne* (containing *L'enfant aux mains de lumière*); H. Duvernois, *Servante and Morte la bête* (very dramatic); Barbusse, *Force* (three stories by the author who still holds out his message against society). One of the "best readers of the year" has been André Maurois's *Meïpe ou la Délivrance* (translated into English)—three real stories adapted to literature, the first dealing with Goethe. Pierre MacOrlan tells in his inimitable way two stories in *Marguerite de la nuit*. Gyp has a new collection, *Ces bons Normands*.

**VARIOUS ITEMS.** Fragments by Mallarmé have been published for the first time, under the title *Igitor*. Maeterlinck gave a volume parallel to his *Vie des Abeilles*, in *Les Termîtes*. In the collection "Nobles vies" (Plon) Clémenceau gave a striking appreciation of the life of *Démocratie*, in which it is very hard not to see allusions to his own personal political career and to the ungratefulness or blindness of even intelligent peoples who fail to recognize their really great leaders. *Madame Roland*, by Mme. Clémenceau-Jaquemaître is in the same collection. Barbusse has felt called to give his view on *Jésus*. Duhamel in his *Lettres au Patagon* gives suggestive views on various topics and always in his inimitable manner (orators, scholars, theatre, illness, amateurs, etc.) De la Fouchardière in his frank and clever way does the same thing in *Le Diable et le bénitier*. Delteil, who last year won the Prix Femina with his much discussed *Jeanne d'Arc*, gave a sort of realistic poem in prose called *Les Poilus* generally considered disappointing, but nevertheless containing great epic beauties.

Books of travel continue this year as last to enjoy considerable vogue; they are often signed by the best known men of letters. Thus H. Béraud (so successful last year with *Ce que j'ai vu à Moscou*) gives *Ce que j'ai vu à Berlin*; Paul Morand, *Rien que la terre*, experiences of travel; Dorgelès, *Sur la route mandarine* (China); Fr. de Croisset, *La féerie cingalaise*; H. Bordeaux, *Voyageurs d'Orient*; L. Werth, *Cochinchine*; G. de la Fouchardière, *A la recherche d'un Dieu* (impertinent but amusing imitation of Lamartine and Chateaubriand's accounts of travels in Egypt and Palestine), etc. Here we might place Pierre Benoit, *Le roi lépreux* (a history of the dynasty to which the world owes the famous palace of Angkor). And here also may be mentioned a book dealing with the attachment of French Canadians to the mother country, *Le bouchier canadien-français*, by Prof. L. B. Dalbis. Some books of autobiography of well known men of letters: *The Journal* of the late Jules Renard; Fr. Jammes, *La France poétique*; Fr. Mauriac, *Rencontre avec Pascal* (account of his conversion); Gabriel Faure, *Le bel été* (childhood in the Vallée de la Drôme). Some new volumes of the "Vies amoureuses," *Musset*, by Donnay; *Ronsard* by de Nolhac; *Cléopâtre*, by Miriam Harris. The book on the famous traveller La Pérouse, by Bellessort, at-

tracted much attention, as did Guy de Pourtales, *Vie de Franz Liszt*. Several volumes on monastic or saints' lives: E. Schneider, *Heures bénédictines*; Lucie Delarue-Madrus, *Ste. Thérèse de Lisieux*; E. Dermanghem, *La vie admirable et les révélations de Marie des Vallées*. "The Collection des quatre âges" contains already: *Enfance*, by Mme. Gérard d'Houville; *Jeunesse*, by Fr. Mauriac; *Âge mûr*, by Donnay; *Vieillesse*, by Lavedan. And the collection "Eloges" has added: *Eloge de la Gourmandise*, Vaudover; *du Désordre*, G. Bauer; *de la Paresse*, E. Marsan; *du snobisme*, J. Boulenger.

HISTORY OF LITERATURE AND CRITICISM. An original attempt was made to present, in the form of a sort of Plato dialogue, *Le retour d'Ozanam ou une histoire de la littérature française*, by André Thérive. Another work of a general nature is an *Anthologie du pastiche*, in 2 vols. by Defoux and Dufay. There is no remarkable work on medieval literature, but an edition of Commynes' *Mémoires* has been published. The XVIIIth century fares better: Huguet gives his long promised *Dictionnaire du XVIIIe siècle*; H. Guye has the second volume of his *Histoire de la poésie française au XVIIIe siècle*, Clément Marot et son école; Jean Prévost has a *Vie de Montaigne*.

In the seventeenth century we have: P. Kohler, *Autour de Molière*; Louis Dubech, *J. Racine politique*; André Hallays, *Les deux Perrault*; Massis, *Pascal*. Quite a revision of traditional opinions is contained in Emile Magne's *Madame de Lafayette en ménage*—it amounts to a severe arraignment of the authoress of the *Princesse de Clèves*. The tercentenary of Madame de Sévigné has inspired various volumes: Gérard-Gailly, *L'Enfance et la jeunesse heureuse de Mme. de S.*; H. Célarie, *Madame de S., sa famille, ses amis*; Genès-Pradel, *Mad. de S. dans le Bourbonnais*. For the XVIIIth century we have: Brunot, *Histoire de la langue Française*, Tome VII, *La propagation du français en France jusqu'à la fin de l'ancien régime*. Then vols. V. and VI of the *Correspondance générale de Rousseau*, *Annales Rousseau*, XVI, and V. Marguerite, *J. J. Rousseau et l'amour* (an attack, by the author of *La Garçonne*).

On poetry at the end of the eighteenth century; G. Kramer, *André Chénier et la poésie parnassienne* (Prix-Bodin, de l'Académie). An important work on Romanticism is L. Reynaud, *Le Romantisme, ses origines anglo-germaniques*. On the same period: Arbetet, *Stendhal épicier, ou les informations de Mélanie*; L. Barthou, *Le Général Hugo* (father of Victor); Pierre Flotte, *Alfred de Vigny*; George Sand, *Journal intime* (letters by G. Sand, publ. by Aurora Sand); Ch. Léger, *L'Ère de Balzac* (Mme. Hanska once more attacked); J. M. Carré, *Michélet et son temps*; Jacques Boulenger, *Marceline Desbordes Valmore, sa vie, son secret*. Much comment was caused by the publication of a collection of private papers of Sainte-Beuve giving his intimate appreciation of some of his contemporaries: they are indeed well called *Mes poisons*. The first volume of Renan's *Correspondance* came out. R. Palgen, *Villiers de l'Isle-Adam, auteur dramatique*; Camille Soula, *Essai sur l'Incrédulisme mallarméen*; Paul Voivenel, *Rémy de Gourmont vu par son médecin*. Another sensational book about Anatole France, Mme. Jeanne Marie-Pouquet, *Le salon de Mme Armand de Caillavet* (the latter being considered as hav-

ing shaken France from his natural laziness, and thus as indirectly responsible for much of France's work). A fanatic attack on A. France came from the pen of Barry Cerf, *The Degeneration of a Great Artist*. One must especially emphasize here the completion of the great work under the direction of Eugène Monfort, *Vingt-cinq ans de littérature française, 1895-1920* (two strong volumes, Libr. de France). Gonvague Truc has *Quelques peintres de l'Homme contemporain* (Giraudoux, Montherlant, Martin-du-Gard, Morand, Hamp, Bloch, etc.) And the publisher Kra issues an *Anthologie de la nouvelle prose française*, sister book to *Anthologie de la nouvelle poésie, française*. The collection "Grandes vies" has now: *Vie prodigieuse de Balzac*, R. Benjamin; *Le Roman de Villon*, Carco; *Vie paresseuse de Rivarol*, Latzarus; *Vie raisonnable de Descartes*, Dimier; *Vie douloureuse de Rimbaud*, J. M. Carré.

LITERARY EVENTS. Commemoration of tercentenary of Mme de Sévigné, and of Mlle. de Scudéry; Centenary of Brillat-Savarin; of Paul de Saint-Victor, of Emile Montégut; fiftieth anniversary of Fromentin's death, and of George Sand (a special room is now dedicated to her in the Musée Carnavalet). Tenth anniversary of Verhaeren's death and his ashes removed to Belgium. Inauguration of a Victor Hugo chair at the Sorbonne, provisional professor, Henri Ghéon the poet; permanent, Professor Lebreton. A special number of *L'Europe* consecrated to Romain Rolland for the 60th anniversary of his birth.

The chief literary prizes not recorded under Novel or Poetry: Grand Prix de littérature, Gilbert de Voisins; Grand prix de l'Académie, Courteline; Grand prix de litt. coloniale, Roland Level, *L'Afrique occidentale dans la litt. fr.*; Prix Roquette-Gonin, Victor Giraud; Prix Claire-Virenque (de litt. spiritualiste), to Mlle. Geneviève Duhamel for *l'ie et mort d'Eugénie Guérin*, and to Henriette Charasson, for *Les heures du foyer* (verses). The Prix de la Vigne (offered by the *Figaro* to the poet who best praised the product of the vineyard) to the poet Raoul Ponchon.

NECROLOGY. Two Academicians, René Boylesve, Jean Richepin (q.v.); two Goncourt Academicians, Elémir Bourges, Guet, Geoffroy (president); others: A. LeBraz; Ch. de Bordeu, author of *Terre de Béarn*.

Received in the French Academy: Em. Picard, G. de Porto Riche, G. Lecomte, Alb. Besnard, L. Bertrand (which was a sort of scandal, Bertrand having attacked rather than eulogized his predecessor M. Barrès). The Academy Goncourt elected Courteline and G. Chéreau, and as president chose J. H. Rosny.

An excellent association has been formed by men of high literary standing to recommend to the public at large the best books of the month and to send them out for a small sum; it is called the *Société Segnana*, and a branch is established in New York, (c/o Dr. Champenois, 1819 Broadway, Columbus Circle). The committee for selection consists of H. Bordeaux, J. Bédier, Henri-Robert, and Paul Valéry, all of the French Academy; Pol Neveu, of the Académie Goncourt; Strowski, of the Sorbonne, and L. Bérard, former minister of education.

**FRENCH SOMALI**, so-mi'le, COAST or FRENCH SOMALILAND. A French colony in Africa on the Gulf of Aden between Italian Eritrea

and British Somaliland. Estimated area, 5790 square miles; estimated population in 1921, 208,000. The port of Djibouti is the seat of the government. Its population in 1921 was estimated at 8366, of whom 354 were European (190 French). After 1922 the government introduced a public elementary schools system at the capital, supplanting the mission school which had been in operation for 20 years. The budget for 1925 balanced at 4,994,700 francs. The country has practically no industries and very little agriculture. The main sources of wealth are commerce, inland trade, and coast fisheries. The imports in 1924 amounted to 293,500,000 francs and the exports to 294,900,000 francs. The chief exports are ivory, coffee, hides and skins. The chief imports are cotton goods, butter, coal, and sugar. A large share of the exports of Abyssinia pass through the port of Djibouti, which is connected by a railway 485 miles long with Addis Abeba. The colony is under a governor assisted by an administrative council.

**FRENCH SUDAN.** A French colony comprising the valley of the Upper Senegal, some two-thirds of the course of the river Niger, and a large part of the Sahara Desert within the sphere of Algeria. Bounded on the east by the territory of the Niger; on the west by Mauritania, the Falemé River, and French Guinea; on the south by the Upper Volta and the Ivory Coast; and on the north by the territory of Algeria. Area, estimated at 648,480 square miles; population, estimated in 1925, at 2,500,000, of whom 1788 were Europeans. The capital is Bamako, with 28,719 inhabitants. Other important towns and their populations are: Kayes, 10,876; Timbuktu, 7000; and Sikasso, 7000. All the chief towns have regional or urban schools. The native crops include ground nuts, millet, corn, cotton, rice, sesame, rubber, and kariti; also a large number of cattle. Native industries are of some importance, including the making of pottery, jewelry, and leather, and weaving. The total imports in 1924 amounted to 52,399,562 francs and the total exports to 20,945,816 francs. The chief imports were cottons, foodstuffs, and metal-work; and the chief exports, ground nuts, cattle, rubber, gum, kapok, skins, and wool. The budget for 1926 provided for 32,000,000 francs. There is railway connection with the coast over a line 745 miles in length. The government is under the Governor-General of French West Africa (q.v.).

**FRENCH WEST AFRICA.** French West Africa, comprising the Atlantic coast colonies of Mauritania, Senegal, French Guinea, and the Ivory Coast, the colony of Dahomey on the Gulf of Guinea, and the interior colonies of French Sudan, Upper Volta, and the Territory of the Niger, includes the river basin of the Senegal, nearly all the upper and middle Niger Basin, the basin of a large number of rivers emptying into the Gulf of Guinea, and the southern part of the Sahara region. It has an area of 4,665,000 square kilometers and a population of 12,283,000, as compared with a total area of all the French protectorates, and mandated territories of 10,241,000 square kilometers and a total population of 55,570,000. So diversified is the native population of French West Africa that official French reports classify the inhabitants under more than 50 groups. Some very extensive areas of this region are practically deserted, while others have a population as high as 60 persons

to the square kilometer. The total number of white people is not over 10,000, their rôle being that of directors or supervisors. Ordinarily the heat is such that they cannot support manual labor nor remain in the country permanently. The natives in general live by farming and stock raising. Up to the present time few useful minerals have been discovered, and the output is comparatively small in value.

In July, 1925, there were 360 primary schools, with a staff of 749 teachers and about 36,000 pupils. Secondary courses are offered in two schools at Dakar. The general budget for 1925 amounted to 88,547,000 francs. Although French West Africa has numerous water-courses, with some exceptions those that are navigable are suitable only for small boats and usually for limited distances. Accordingly, the transportation so essential to the development of the colonies must depend mainly upon the railways. There are about 3000 kilometers of railroads, the principal lines being those of Dakar-St. Louis (Senegal); Thies-Kulikoro (Senegal and French Sudan); Konakry-Kankan (French Guinea); Abidjean-Buke (Ivory Coast); Kotonu-Save (Dahomey); and Porto Novo-Pobe (Dahomey). About 3000 additional kilometers of railroads were either under construction or planned in 1926, but the full programme will not be completed for many years.

Oil nuts, oil seeds, and cotton are the products of chief interest in French West Africa, and on them the local authorities have concentrated their main efforts. An indication of the success attending the efforts to expand native production is to be found in the higher value of French West African trade during 1925. According to provisional figures issued by official sources in the colonial group under consideration, the imports into French West Africa during that year reached a value of 1,101,988,000 francs, as compared with a value of 759,438,000 francs in 1924; exports were valued at 882,091,000 francs, as against 641,781,000 francs in the previous year. Both imports and exports attained a larger amount in the case of every colony except French Sudan, where a 70 per cent increase in imports was accompanied by a 25 per cent decrease in exports. It is probable, however, that some of the exports accredited to Senegal and French Guinea originated in French Sudan. The extent to which expansion in trade is being shared individually by the leading colonies is shown in the official statistics of exports and imports for the early months of 1925—the latest period for which figures are available.

VALUE OF FRENCH WEST AFRICA'S FOREIGN TRADE, BY LEADING COLONIES

<sup>d</sup> Figures for first three months.

A governor-general, assisted by a council, is at the head of the administration of all French West Africa. The seat of government is at Dakar. Each colony is under a lieutenant-governor subject to the governor-general. Governor-general at the beginning of 1926, M. Carde, appointed Feb. 20, 1923.

**FREUD, SIGMUND.** See PSYCHO-ANALYSIS.

**FRIENDS, RELIGIOUS SOCIETY OF.** A mystical religious sect which originated in England in the middle of the 17th century. The founder of this religious society was George Fox (1624-1691), who visited America in 1672. The first Yearly Meeting in the United States was held at Newport, Rhode Island in 1661, and has continued under the name of New England Yearly Meeting. Others established within the next forty years are known as Baltimore, Philadelphia, New York, and North Carolina Yearly Meetings, and these are composed of quarterly and monthly meetings having one or more congregations. In the nineteenth century, others were formed as migration moved westward. The largest body, known as the Orthodox Group, organized what is known as the Five Years Meeting in 1902, which meets as a delegate body every five years, and in 1926 consisted of twelve yearly meetings with a membership of 81,566. Its headquarters are at Richmond, Indiana. The work of the various departments, such as Home and Foreign Missions, Peace, Religious Education, etc., was under the direction of a General Secretary and executive secretaries of Boards. *The American Friend*, a weekly religious journal, is published at headquarters, as is also literature for the schools of religious education.

The Five Years Meeting also maintains seven colleges for higher education.

Haverford College is maintained by Philadelphia Yearly Meeting, and Pacific College by Oregon Yearly Meeting, not a part of the Five Years Meeting. Another Orthodox body not a part of the Five Years Meeting is the Ohio Yearly Meeting, with a membership of 6368 in 1926.

The Liberal Branch of the Religious Society of Friends includes seven Yearly Meetings federated in the Friends' General Conference, which meets in the even numbered years and conducts work in religious education, social service, and advancement of Friends' principles. The separation of 1827 centred around the doctrinal issues of that day and the preaching of Elias Hicks. The General Conference claims to be "liberal" in that it asks each individual to follow the voice of God in his own soul rather than any individual or church authority. The membership in 1926 was 16,689, and there were 140 meetings. Publications include the weekly periodical, *Friends' Intelligencer*, and a monthly magazine for children, *The Scattered Seeds*. The Society conducts several secondary schools.

The tendency among the different branches of Friends in America was more and more towards

working together and with English Friends. Among the united undertakings were: The Young Friends' Conference; Woolman School, founded in 1915 as a school for religious and social study, and located at Wyncote, Pa.; the American Friends' Service Committee, formed in 1917 for war relief work, and since the war conducting Friends' Centres at home and abroad for international understanding and reconciliation between conflicting nations, races, and other groups.

**FROTHINGHAM, PAUL REVERE.** American Unitarian clergyman, died in Boston, November 27. He was born at Jamaica Plain, Mass., July 6, 1864, and graduated from Harvard College in 1886. Three years later he graduated from Harvard Divinity School, and in the same year became pastor of a church at New Bedford. In 1900 he was called to the Arlington Street Church, Boston, and continued as its pastor until his death. Dr. Frothingham was conceded to be a leader in the American Unitarian Church, occupying as he did the historic pulpit of Dr. William E. Channing, and was a clergyman with a distinct and decided view of Christianity. He was an able preacher, and a man of scholarly and literary tastes. At various times he had been preacher to Harvard University, and had served two six-year terms as overseer of that institution. In 1915 he received the degree of doctor of divinity from Harvard. His publications were: *William Ellery Channing: His Messages from the Spirit; The Temple of Virtue* (1907); *We Believe* (1917); and *Edward Everett, Orator and Statesman* (1925).

**FRUIT AND FRUIT RAISING.** See HORTICULTURE.

**FRUIT MOTH, ORIENTAL.** See ENTOMOLOGY, ECONOMIC.

**FULLAM, WILLIAM FREELAND.** American naval officer, died at Washington, D. C., September 23. He was born in Pittsford, N. Y., Oct. 20, 1855, and graduated from the United States Naval Academy at the head of his class in 1877. He passed through the various grades of the navy until Dec. 15, 1914, when he was appointed rear-admiral, and was superintendent of the United States Naval Academy at Annapolis. He served on the *Trenton* and the *Marion* on the European station, and the *Sweara* on the China station. From 1883-1904, he was on duty at the United States Naval Academy, being head of the Department of Ordnance. During the Spanish-American War he served on the *New Orleans*; later he commanded the *Chesapeake* and *Terror*, practice ships, and the *Marietta* in the West Indies. He commanded the Naval Training Station at Newport, R. I., 1907-09, and the battleship *Mississippi* in 1910. He was commandant of Naval Training at the Great Lakes, Ill., in 1912, and in the following year was aid for inspections to Secretary of Navy Meyer, and for personnel to Secretary Daniels in 1914. In 1915 he was made commander-in-chief of the Pacific Reserve Fleet, and in 1916-17 commander of the Patrol Force of the Pacific Fleet. After the outbreak of the War he commanded the second division of the Pacific Fleet and was senior officer in command of the Pacific, 1917-19. He retired Oct. 20, 1919. He was the author of: *Hand-Book of Infantry and Artillery, U. S. N.* (1899); *Text-Book of Ordnance and Gunnery* (1902); *The Recruits' Handy-Book*; and cooperated in the preparation of various navy drill books. He

was an outspoken critic of modern naval practice and theory, believing that aircraft and submarine had reduced the battleship to a subordinate place in modern naval armament. While superintendent of the Naval Academy his recommendation that seven midshipmen be dismissed for irregularity in examinations was not sustained, five of the accused being cleared by the court. He also recommended the abolition of the use of chewing gum in the navy in 1911, and for many years it was forbidden.

**FUQUA**, HENRY L. Governor of Louisiana, died at Baton Rouge, La., October 11. He was born at Baton Rouge, Nov. 8, 1865, and after a preparatory education at Magruder's Collegiate Institute at Baton Rouge became a student in the Louisiana State University. His first employment was with a corps of engineers in the construction of what was later the Yazoo & Mississippi Valley Railroad, and later engaged in bridge building on the same line. He then engaged in the hardware business at Baton Rouge in 1892, organizing the Fuqua Hardware Company, and serving as its manager until 1916. In 1916 he became warden of the State Prison of Louisiana, holding that position until 1924. His work included also the management of three large plantations owned by the State. In 1924 he became governor, defeating Lieut.-Governor Hewitt Bouanchaud, a Catholic running on an anti-Klan platform, and Huey P. Long. After his election the legislature passed, at his suggestion, bills providing heavy punishment for masking in public and for committing crimes while wearing a mask.

**FUR AND FUR-BEARING ANIMALS.** See ALASKA.

**GABUN.** See FRENCH EQUATORIAL AFRICA.

**GALICIA**, gá-lish'i-á. A former crownland of the Austro-Hungarian Empire, but after 1919 an integral part of Poland. The district lies to the south of Poland and to the west of Podolia in Russia.

**GALL STONE DISEASE.** In the YEAR BOOK for 1925 there was given a preliminary account of a new method for making the gall bladder visible in röntgenograms. This method, known as cholecystography, has since come into general use throughout the civilized world. It is summed up by Dr. Cade in the *Lancet* for July 3, as follows: "Cholecystography is a new method of investigating the biliary system based on the ability of the liver to excrete certain dyes which are opaque to the X-rays. It is a means of studying the topography of the gall bladder in the living; throws light on the physiology of the gall bladder, on its activities under various conditions and on its multiple functions. It is a means of controlling the non-operative treatment of chronic cholecystitis. It adds greatly to the accuracy of the clinical diagnosis and is to the biliary system what the opaque meal is to the alimentary canal and pyelography to the urinary tract. It has made rapid advances in a very brief space of time."

In the same issue of the *Lancet* is an editorial on the great importance of these dyes for medical diagnosis. All are derivatives of phenolphthalein. The sulphone compound is used for testing the functions of the kidneys. The chlorine compound which is excreted largely by the liver can be utilized to measure the functional capacity of that organ, while the concentrating quality of the bile renders that fluid opaque to the röntgen

rays and thus first suggested the new development cholecystography. It was however soon learned that the bromine and iodine compounds are superior in this respect to the chlorine compound. By means of the röntgen plates we can determine the substances which are able to contract the gall bladder and which have already been studied by means of the duodenal sound. Thus a meal rich in cream and butter will cause the shadow of the gall bladder to disappear in two or three hours and we can understand the influence of large doses of olive oil in keeping the biliary passages clear. Sulphate of magnesium requires longer and produces less contraction.

**GAMBIA.** A British protectorate and colony in West Africa at the mouth of the Gambia River. Area of Gambia proper, four square miles; population about 9000. Area of protectorate, 4130 square miles; population in 1921, about 200,000. The capital is Bathurst, on the island of St. Mary (population, 9227 in 1921). In 1924 there were eight elementary government aided schools with 1688 pupils enrolled. In the same year the imports totaled £672,018 and the exports, £1,002,330. The chief imports were wearing apparel and foodstuffs and the chief exports, ground nuts, hides, and palm kernels. The public revenue in 1924 was £208,613 and the public expenditure, £203,635. The public debt amounted to £125,893. The tonnage of vessels entered and cleared in the foreign trade in 1924 was 1,097,366 tons, of which 643,072 were British. There are no local railways. The colony is administered by a governor, an executive council and a nominated legislative council containing an unofficial element. Governor at the beginning of 1926, Capt. Cecil H. Armitage.

**GARBAGE AND REFUSE DISPOSAL.** The trend towards incineration as a means of the disposal of garbage and refuse where the two are collected together instead of separately continues. Existing reduction works for recovering grease and fertilizer base from garbage unmixed with other refuse were still operated either on a contract basis or directly by some of the largest cities of the country. A variant from the usual type of reduction works was completed during the year by the contractor for garbage disposal at Kansas City, Mo. The garbage there was being made into food for animals. Thousands of hogs on a distant fruit and stock ranch were eating the garbage of Los Angeles, under a private contract, and garbage disposal by feeding to hogs was still the practice in many smaller cities. "Sanitary fills," at which garbage and refuse are used to raise the level of low lands, with a good cover of ashes or earth maintained at the top of the fill was still the method of disposal for these materials at Seattle, Wash., and some other cities, and was under consideration during the year at San Francisco as a substitute for the use, up to capacity, of an old destructor of the British type.

In England, where the time-honored "dust bin" receives garbage and all other classes of refuse at the points of production, for subsequent municipal removal, sorting for recovery of salable materials and to reduce the volume going to destructors, where these are used, was on the increase, but a large percentage of the mixed refuse of British cities was still dumped on land, including much of that produced by the nearly

thirty cities and boroughs composing the administrative county of London. Birmingham, England, opened new refuse salvage and destructor works on June 15, in continuation of its policy of substituting such plants for its old "tips" or dumps. According to *The Surveyor* (London) of June 18, 1926, the new plant, known as the Tynsley works, was to serve 46,000 houses and 210,000 population, which produced 51,500 short tons of mixed refuse annually. Collections were made by 5-ton electric vehicles. These dump the refuse into hoppers, from which it passes through rotary screens of  $\frac{3}{8}$ -in. mesh. The screens remove some 40 per cent of the "fine dust," which is transported by an "aërial ropeway" to a dumping area. A magnetic separator at each screen removes cans and other magnetic material from the tailings before the latter go to salvage sorting belts. What is left of the tailings is lifted to hoppers, one above each of the two destructor units. Clinker, the hard residue after burning, is hauled from the destructor to a double-roller crusher in trucks pulled by an electric-battery motor. The crushed clinker passes through a screen-type of magnetic separator and then to a second screen which grades the crushed clinker and delivers it into corresponding compartments in a hopper. The salvaged paper is conveyed by suction to baling presses. Cans are detinned and then baled by two hydraulic presses. Electric power for plant operations is generated from steam produced by heat from the destructor. For a summary of refuse disposal at six British municipalities, one of which used its refuse for raising low land, see *Engineering News-Record*, Sept. 30, 1926.

#### GARDENING. See HORTICULTURE.

**GAS, ILLUMINATING AND FUEL.** The Statistical Department of the American Gas Association issued in 1926 statistics compiled from returns made by 544 gas companies, representing 86.2 per cent of the total gas produced and purchased, and extended by estimates and information derived from various sources to the American gas industry as a whole. In 1925 there were 987 companies in the United States engaged in supplying manufactured gas to the public, New York, with 91 companies, followed by Pennsylvania with 88 companies, and Illinois with 62 companies standing at the head of the list. Of the 987 companies mentioned 58 were municipal plants supplying manufactured gas to the public. There were 82 coke oven plants which sold gas to distributing companies. The gas-producing plants, according to the process employed, were grouped as follows:

Coal gas plants .....	189
Water gas plants .....	429
Oil gas plants .....	71
Mixed gas:	
Coal and water .....	150
Water and oil .....	3
Water and coke oven .....	9
Coal, water and coke oven .....	5
Coal and oil .....	3
Coal, water and purchased .....	5
Water and purchased .....	12
Water and natural .....	4
Oil and natural .....	3
Reformed natural .....	4
Not known .....	1
Distributing plants (gas purchased) .....	99
Total manufactured plants in U. S. ....	987
By-Product coke oven plants .....	82

The number of meters in use in the United States was estimated at 10,115,640 ordinary meters and 709,360 pre-payment meters, or a total of 10,825,000. Other distribution data were as follows:

Number of consumers .....	10,600,000
Miles of gas main .....	86,823
Meters per mile of main .....	125
Number of active services .....	7,500,000
Population served .....	52,000,000

The estimated production of manufactured gas in 1925 was as follows:

	Thousand cu. ft.
Carburetted water gas .....	232,000,000
Coal gas .....	63,700,000
Oil gas .....	28,700,000
Coke oven gas purchased and distributed for public use .....	76,600,000
(Coke oven gas consumed at point of pro- duction or for purposes other than public use is not included.)	
Total manufactured gas .....	401,000,000
Natural gas purchased and mixed with manufactured gas for public use .....	56,100,000
Grand total .....	457,100,000

Considering the increased volume of manufactured gas sold, the figures of the American Gas Association as to the purposes for which it was used were of interest. These estimates were as follows:

Purpose	Per cent	Thousand cu. ft.
Domestic uses .....	71.3	300,500,000
Industrial and commercial uses .....	26.8	113,000,000
Unclassified .....	1.9	7,900,000
Total .....	100.0	421,400,000
Total revenue from sale of gas .....		\$452,000,000.00
Miscellaneous operating revenue .....		13,000,000.00
Total gross operating revenue .....		465,000,000.00

In the manufacture of gas for public use the following quantities of coal and oil were used: Bituminous coal, 7,400,000 short tons; anthracite coal, 960,000 short tons; coke, 3,800,000 short tons; gas oil, 932,400,000 gallons; fuel oil (not used for gas making purposes), 14,960,000 gallons. These figures do not contain the materials used for the manufacture of the coke oven gas purchased by distributing companies for public use. In 1925, a total of 89,758 persons were employed by gas companies as officers, executives and salary and wage earners.

**GAS, NATURAL.** The United States Bureau of Mines estimated the production of natural gas in 1925 as 1,164,000,000 M cubic feet, valued at \$255,000,000. In 1925 the production of gasoline from natural gas was estimated at 1,104,900,000 gallons, valued at \$117,000,000, the product, which was raw unblended gas, resulting from the treatment of natural gas to the amount of 1,200,000,000 M cubic feet.

The natural gas produced in the United States and delivered to consumers, according to the Bureau of Mines, in 1923-24, is given in the accompanying table.

**NATURAL GAS PRODUCED IN THE UNITED STATES AND DELIVERED TO CONSUMERS,  
1923-1924, BY STATES\***  
[Value is at point of consumption]

State	1923		1924	
	M cubic feet	Value	M cubic feet	Value
Arkansas .....	24,215,000	\$3,255,000	36,616,000	\$4,908,000
California .....	181,484,000	22,787,000	189,692,000	35,949,000
Colorado .....	800	400	47,600	1,700
Illinois .....	4,049,000	690,000	4,072,000	759,000
Indiana .....	880,000	460,000	998,000	494,000
Kansas .....	30,913,000	11,249,000	25,580,000	10,087,000
Kentucky .....	11,953,000	8,156,000	12,875,000	3,432,000
Louisiana .....	112,031,000	6,022,000	160,945,000	7,626,000
Michigan .....	700	320	800	800
Missouri .....	17,000	14,000	71,000	61,000
Montana .....	1,470,000	317,000	1,071,000	272,350
New York .....	6,497,000	3,739,000	6,196,000	3,632,000
Ohio .....	53,812,000	25,675,000	47,396,000	24,203,000
Oklahoma .....	203,082,000	31,214,000	214,452,000	31,045,700
Pennsylvania .....	112,562,000	45,873,000	105,863,000	45,546,000
South Dakota .....	33,000	16,600	3,000	2,500

**GEOGRAPHICAL SOCIETY, AMERICAN.** The oldest geographical society in the United States, founded in 1852, "to collect and disseminate geographical information by discussion, lectures, and publications; to establish in the chief city of the United States a place where may be obtained accurate information on every part of the globe; and to encourage such exploring expeditions as seem likely to result in valuable discoveries in geography and related sciences."

The Society's leading activity in 1926 was in the field of publication. Its publications consist of books, pamphlets, maps, and a quarterly periodical, the *Geographical Review*. The *Review* contains a great variety of articles based upon the analysis of the world's current geographical literature, and reviews of the more significant geographical books. The books and pamphlets published by the Society fall into six series. The *Research Series* consists of specialized monographs. The *Special Publications* are of a more general appeal. The *Library Series* is devoted primarily to the collections of the Society. Two issues of the *Outing Series* had appeared up to the end of 1926: a trampers' guide to the Palisades Interstate Park and a trampers' guide to the vicinity of New York City. The publications of the fifth series are known as the *Map of Hispanic America Publications* and accompany an important group of maps which the Society is producing. Number 2 of this series, by Prof. W. M. Davis, a volume on the physical geography of the Lesser Antilles, was published

in 1926. The basic maps of Hispanic America are on a scale of 1:1,000,000, and are in essential conformity with the International Millonth Map of the World. Notable progress in this work was accomplished in 1926, several sheets having been made ready for distribution and others being in an advanced state of preparation. The first volume of the sixth series, *Oriental Explorations and Studies*, which was published late in 1926, deals with the explorations of Prof. Alois Musil in the Northern Hejaz, Arabia.

The maintenance of a specialized geographical library and of an extensive collection of maps is an important phase of the Society's activity. Valuable additions were made to these collections in 1926. Six regular lectures by distinguished explorers or geographers are delivered each year before the members and guests. The Society recognizes contributions to the development of geographical science and exploration in its elections to honorary and corresponding memberships and in the bestowal of medals. During 1926 seven medals were presented by the Society. The president of the Society in 1926 was John H. Finley, LL.D.; Isaiah Bowman, Ph.D., was director. The Society's building is at Broadway and 156th Street, New York City.

**GEOGRAPHIC SOCIETY, NATIONAL.** An organization founded in 1888, "for the increase and diffusion of geographic knowledge." During the year it continued its policy of supporting exploration, research, and educational work. Dr. Neil M. Judd led what was probably to be the final expedition of the series sent into the Chaco Canyon country of New Mexico by the Society for the excavation and study of the prehistoric apartment house at Pueblo Bonito, as a result of which that region had come to be considered the most important site of Indian culture north of the Rio Grande River. The two objectives of this expedition were to determine the age of the various civilizations that inhabited Pueblo Bonito and to continue the exploration of stratigraphic conditions in the region. In the realization of these objectives, eleven other experts in different fields, including geology, engineering, and archaeology, joined Dr. Judd in this work.

Applying the discovery of Dr. A. E. Douglass that certain cycles in tree-ring formations agree

with the 11-year sun-spot cycle, it was possible to establish a calendar dating from the beginning of the growth of the trees from which logs were taken for the construction of mission buildings under the old Spanish régime down to the present. This discovery also made it possible to establish a calendar for the Bonitian period. Between these two calendars there existed an important hiatus. To fill this gap and thus to secure a consolidated calendar of the years from the beginning of the Bonitian civilization to the present, a search was made for timbers which grew in the period between the two calendars, with some success. The stratigraphic exploration took the form of running trenches through the débris pile of Pueblo Alto on the cliff 1 mile north of Chaco Canyon and through that of Penasco Blanco 4 miles west of Pueblo Bonito. This series of expeditions demonstrated that the ancient Indians of our Southwest, to whom the Egyptian Pharaohs and the Babylonian Kings were unheard-of strangers, used the same general methods of irrigation that were employed in the earliest history of the Nile and the Euphrates.

Under an appropriation of \$55,000 from its research fund, the Society was able to provide for a third continental solar observation station for the study of the fluctuations in the sun's radiation, under the direction of Dr. Charles G. Abbot, of the Smithsonian Institution. After an investigation of available sites in Asia and Africa, Mount Brukkaros in South Africa, was selected because of its atmosphere at once free from impurities, dry, rare, and constant. With the support of the South African Government and the aid of the Hottentots, the station was put in operation with W. H. Hoover and F. A. Greeley as observers. Progress made in this work of observing the variability of the sun's radiation served to support the theory that there is a very close relationship between these variations and the weather, and to justify the hope that through their interpretation long-range forecasting would become possible. Such long-range forecasting would be of great help to farmers, to those who plan conventions and open-air meetings, to ships at sea, etc.

In its work of encouraging research, the Society awarded the Hubbard Gold Medal to Lieut-Com. Richard E. Byrd, Jr., U. S. N., and its Special Gold Medal to his pilot, Floyd Bennett, for their notable contributions to geographic knowledge in reaching the North Pole by airplane. See AERONAUTICS and POLAR EXPLORATIONS. In endorsing the movement for the establishment of the Shenandoah National Park, the Society voted a grant for the purchasing of a tract of land to be included in the Park when the Government should authorize it.

The Society continued its series of State maps of the American commonwealths, issuing those of North Carolina, South Carolina, Georgia, and Eastern Tennessee. During 1926 bulletins dealing with the geographical backgrounds of current events were furnished to more than 600 newspapers, and weekly bulletins of timely geographical information were sent to about 30,000 school teachers. As a part of its educational work a weekly ready-to-print service was supplied to about 1200 daily or weekly papers. Upon request bulletins relating to the geography of Bible lands and mission fields were sent to about 80 church and Sunday School periodicals

and used by them in schools where Americanization work was in progress.

The chief activity of the Society in the diffusion of geographic knowledge is carried on through its official publication, the *National Geographic Magazine*. At the end of 1926 there was a membership of 1,050,000, representing every civilized nation. Officers for the year were: President and Editor, Gilbert H. Grosvenor; Vice-President, Henry White; Vice-President and Associate Editor, John Oliver LaGorce; Treasurer, John Joy Edson; Secretary, O. P. Austin; Associate Secretary, George W. Hutchison; General Counsel, Edwin P. Grosvenor; Chairman Committee on Research, Frederick V. Coville; Assistant Editors, William Joseph Showalter and Ralph A. Graves; Chief of Illustrations Division, Franklin L. Fisher; Chief of School Service, J. R. Hildebrand. Headquarters are in Washington, D. C.

**GEOGRAPHY.** See EXPLORATIONS.

**GEOLOGICAL SURVEY, UNITED STATES.** The U. S. Geological Survey, during the year 1925-6, made geologic surveys in 43 States and the District of Columbia including geologic mapping, determination of stratigraphy, structure and geologic history, and examination of mineral resources. It cooperated with eight States in geologic work and continued detailed geologic mapping of the coal fields of public land States, preparing reports showing the outcropping, thickness, quality of coal, and estimates of available tonnage. Eight field parties were maintained in Alaska during the field season. The bureau also took over by transfer from the Bureau of Mines the supervision of the production of coal and oil on public lands in Alaska as well as the supervision of mine safety. The report shows that 227,036 books, 8949 geologic folios, and 760,346 maps of the Geological Survey were distributed during the year of which 637,779 maps and folios were sold for \$47,840.86.

**GEOLOGY.** Interest in the several branches of geology continued unabated during 1926. As usual, many of the contributions were concerned with economic problems and with special fields of which notice could hardly be taken in a brief review, but a number of general works and researches with a broad appeal may be noted in the array of publications. The 14th session of the triennial Congress of Geologists, held in Madrid during the summer, was the outstanding event in the list of meetings and was largely attended. In accordance with custom the members were invited to contribute to a particular subject of international interest, with the purpose of later bringing the papers together to form an exhaustive report by the leading authorities in the field. The topic for this meeting was the world supplies of phosphate and pyrite.

An important place in the list of reference works must be assigned to *Geologie der Erde*, according to the promise indicated by the first installment that has recently been issued. The plans, as drawn by Professor Krenkel, call for the issue of five volumes, each devoted to the description from modern geophysical and geochemical standpoints of one of the continents. The initial volume, of which the first of two parts, has so far been published, relates to Africa, and was prepared under the immediate direction of Professor Krenkel, the chief editor. It is conceived on a broad and comprehensive, if

not exhaustive, scale, corresponding to the needs of students interested in physiography, stratigraphy, tectonics and mineral resources in their larger development. R. Ruedemann was to have charge of the volume descriptive of North America.

For the study of the earth's interior, *Der Aufbau der Erde* by Gutenberg can claim consideration as a useful reference book in which are incorporated the later methods and points of view. The developments in radioactivity, seismology, the study of physical constants of minerals and rocks and the application of the principle of isostasy have supplied valuable criteria for investigation of the recondite problems connected with the internal structure of the earth. It would appear to be fairly established that the structure is complex and that the outer shell of crystalline rocks, mainly silicate minerals, is of very moderate thickness, possibly only 40 or 50 miles. Below this crust are layers of increasing density, in which iron compounds probably predominate, arranged concentrically about a core that possesses a relatively high specific gravity. Gutenberg would explain this high density by the uncombined or atomic condition of the constituents, whereas the intermediate layers consist of simple binary compounds and silicates in isotropic or glassy state, and the crust largely of crystalline silicates. In general this conforms to the prevailing views of the present day.

Joly's *History of the Earth* belongs to the same class of works as the preceding volume in that it treats of the geophysical aspects of the subject, but especially from the viewpoint of the writer's own researches and speculations. With due allowance for some of the more daring hypotheses, it may be regarded as a very readable account of the newer developments.

An excellent treatise on physiography is *Traité de Géographie* by E. de Mertonne, recently rewritten and now issued in three volumes with much new illustrative material. It is a work of reference of the first order. Of more popular nature is *Geology in Relation to Landscape*, by J. Henderson, who may be commended for his clear logical presentation of the subject; it should prove of value both for the layman and as an introductory textbook. Other volumes in this class, recently published, are Shiner's *Introduction to Earth History* and Quale's *Elements of Geology*.

The study of glacial geology has gained both intensively and extensively of late years. It is no longer confined to the limits of the Pleistocene, the Ice Age of older terminology, for the events of that period were by no means unique. There were ice invasions in the Mesozoic, the Paleozoic and Pre-Cambrian eras, and at one time or another they spread over all the climatic zones. As a foremost student of the later and earlier glacial phenomena, Professor Coleman has made a timely and authoritative contribution in his volume, *Ice Ages, Recent and Ancient*.

AGE OF THE EARTH. THE YEAR BOOK for 1925 mentioned the novel applications of radioactivity to the estimation of geological time and some of the results already obtained by these methods. On the whole, the estimates have been concordant and in conformity with prevailing geological and palaeontological opinion, which has rather protested against the rigid views taken by geophysicists like the late Lord Kelvin

who based their estimates on the rate of cooling of the earth, uninfluenced by atomic disintegration. An allowance of 25 or even 50 million years seems altogether too short for the accomplishment of such tremendous changes as have occurred in both the organic and inorganic world. The newer methods of time calculation have their basis in the lead-uranium and lead-thorium ratios found in minerals. The rates of atomic disintegration are supposed to have been nearly uniform from the time the minerals were deposited. This is an assumption of critical importance, of course, to the accuracy of the calculations, but has the support of such authority as Arthur Holmes, who is perhaps the leading investigator in the field.

A recent analysis of the evidences by that physicist would indicate that more dependence for accuracy may be placed upon the lead ratios of uranium minerals than upon similar ratios derived from thorium minerals. The end products from thorium disintegration are not so resistant to chemical and physical change, particularly under the action of percolating waters, as lead uranate which results from the breakdown of the original uranium compounds. Consequently, whenever there is a wide discrepancy between the results obtained from the two ratios, preference is to be given to the lead-uranium calculations, which are likely to be of larger magnitude for the reason already explained.

A systematic examination of uranium minerals from various geological and geographical environments was in progress, out of which might come a new and more precise chronology for the use of geologists. The investigation in the United States was in charge of A. C. Lane.

The published estimates for the age of the Pre-Cambrian formations, which are the lowest and oldest of the geological series, range within wide limits, that is, from somewhat less than 1000 million years to over 1500 million years. They give an indication of the enormous lapse of time represented in the interval between the earlier and later formations of that era, and likewise some idea of the duration of life on the earth, of which the first definite evidences begin to appear at the close of the Pre-Cambrian age.

THE EARTH'S RIGIDITY. An experimental determination of the compressibility of minerals and rocks, by Adams and Williamson, is of importance in relation to the behavior of the rock materials under pressures encountered at considerable depths. With the apparatus used, it was possible to exert pressures up to 12,000 megabars, corresponding to those attained at depths of approximately 40 kilometers below the surface. In the case of completely crystalline rocks it was found that their compressibility may be calculated from the known corresponding values for the constituent minerals, except at low pressures. In general the compressibility varies with the silica content, being lower for the more acidic materials and increasing with the proportion of the bases. Quartz and metallic iron may be regarded as representing the extremes of compressibility as applied to natural mineral materials. From the ratio of the two kinds of seismic waves transmitted through the earth and the known elastic behavior of compact rock the rigidity of typical rocks may be measured. The rigidity of the earth as a whole, which

probably is near that of steel, is higher than the value of the most rigid silicate rock. Earth vibrations travel at about 5.6 kilometers a second in granite, while their speed in the basic rock dunite is around 7.4 kilometers a second. The speed of the initial waves of an earthquake is a little above 7 kilometers and indicates a source within a material of the composition of gabbro or pyroxenite. There is reason to believe, therefore, that a basic layer exists at shallow depths below the siliceous outer shell.

**EARTHQUAKES.** The need for greater precision in the use of terms by seismologists is argued by Oldham, who makes a distinction of fundamental value between shocks of such size as to impress the human senses—that is, earthquakes in the popular sense of the word—and the small magnitude vibrations that escaped attention until the invention of delicate instruments made their record possible. The establishment of earthquake stations on a broad scale has led to the discovery that these minute tremors are of very frequent occurrence. It has been thought that they might represent long-distance manifestations of heavy shocks which had their centres in remote uninhabited districts or originated possibly under the oceans. Such view seems no longer justified on the basis of recent study. There are probably two kinds of earthquakes which send out similar vibrations but have their origins in different zones within the earth. The larger number of sensible shocks centre about a depth zone of less than 10 kilometers. They are connected with crustal dislocations along fault planes; their waves are transmitted both through and around the earth. They include the destructive shocks. The term "episeism" may be used to distinguish them and is descriptive of their shallow origin. For the deep-seated disturbances of small magnitude the word "bathyseism" may be employed, alike connoting the position or zone from which their vibrations start. No certain explanation has been found for this class of quakes. It is possibly to be connected with changes of bulk in the deeper zone brought about by regrouping of the constituent chemical elements of the rock materials; for example, by the entrance of oxygen into the combinations. Despite their small size, vibrations from this source travel at speeds commensurate with the large-amplitude waves and for long distances. See **EARTHQUAKES; SEISMOLOGY.**

**IGNEOUS ROCKS.** The Katmai volcanic district of Alaska has been the centre of much popular and scientific interest since the remarkable manifestations that accompanied the eruptions of 1912-13 and that have been described in their various phases by investigators in the service of the National Geographic Society. A contribution to the subject was by Fenner who describes the rock materials with reference to their chemical and petrographic characteristics. From their consideration some light is obtained as to the processes by which igneous rocks, primarily of more or less homogeneous nature, split up during the cooling stages into quite distinct mineral aggregates. To these processes the term "magmatic differentiation" is given. Bowen, on the basis of studies in other districts, has sought to explain the effects by fractional crystallization, or at least has emphasized that theory in preference to other possible explanations. The evidences from Katmai, according to Fenner, point more to a combination of several influences than to

one controlling factor during the period of cooling.

The possibility of igneous rocks contributing to petroleum and natural gas accumulations was considered by Lewis, who shows that methane is practically universally present in magmas and may lead to the production of various carbon and hydrocarbon compounds, as well as elemental carbon, water and hydrogen. The more volatile substances diffuse upward in all parts of the earth and under certain conditions may be trapped in the sedimentary formations. There is a certain plausibility about this view of the derivation of oil and gas, although the weight of evidence leans heavily toward the organic method of origin, which is now almost universally accepted by practical oil geologists.

**COLORATION OF SEDIMENTS.** Certain stratified formations are characterized by a red color, like the Red Beds which spread over many thousand square miles in the western United States and are a notable element in the scenery, also the Salina shales of central New York and the Newark sandstone along the Atlantic seaboard. The coloration, according to Dorsey, may definitely be ascribed to the iron content, although the percentages of that element are not necessarily larger than those present in non-red rocks and even may be less. The determinative factors are the relative ratios of the ferric to ferrous oxides and the degree of dehydration the iron minerals exhibit. Ferric oxides by loss of water produce red turgite and red hematite, which are the principal coloring materials. Dehydration takes place most rapidly in warm moist climates, and not under arid conditions as has been postulated by many geologists. In most instances red beds represent continental deposits, since when exposed to the action of sea water the ferric oxides are reduced with loss of coloration. Yet, a large-scale temporary influx of continental waste into the sea may result in the building up of a wedge of red sediments within a marine environment, as illustrated by the Salina.

**SALT DOMES.** An experimental study of the origin of salt domes, by Torrey and Fralish of the University of Pittsburgh, lends support to the mechanical or pressure explanation, as against the view that the up-arching represents the effects of the crystallizing force of rock salt deposited by infiltrating waters or that the beds have been upraised by a buried volcanic plug. Under lateral pressure a plastic mass, which is the nature of rock salt when covered by thick sediments, has a tendency to assume a rounded or elliptical shape as it moves along a fissure up into the higher beds which accommodate themselves to the movement by bending away from the mass. The strata at the surface, thus, dip away from intrusion, the angle decreasing with the distance. The resulting form depends to a great extent upon the nature of the material above and below the plastic mass. Although it is too early to pass final decision on the matter, this theory conforms more closely to the conditions as they are known at present than any other that has been proposed, and the recent experiments have given added authority for its application to the salt mounds of the Gulf Coast.

**PHYSIOGRAPHY.** The Rocky Mountain trench, according to F. P. Shepard, has the form of an uplifted block that has been changed by erosion into a depression, one of the largest in the world.

The trench runs from just south of the international boundary in longitude 115° West for almost 1000 miles along the west side of the Canadian Rockies and has a depth of 3000-10,000 feet. The formations on the borders of the depression are younger than those within it; consequently, the strata between the boundary faults would appear to have been lifted rather than depressed; differential erosion later reversed the conditions as to relative levels.

An interesting study of a remarkable earth subsidence of recent date was given by Pratt and Johnson who describe the movement that has taken place in the last few years on Gaillard Peninsula which projects into San Jacinto Bay, on the coast of Texas. A large part of the peninsula, an area of many square miles with the Goose Creek oilfield near the centre, has subsided more than three feet and is now submerged by the waters of the bay. This change of level has entailed a question as to the ownership of the oil deposits, inasmuch as the State of Texas lays claim to submerged lands. Examination of the conditions reveals the source of the subsidence in the abstraction of some 500,000,000 cubic feet of oil, gas and water in wells bottomed at depths of from 1000 to 4100 feet below the surface, a quantity considerably in excess of the volume represented by the surface depression.

**ORE DEPOSITS.** The relation of igneous magmas to ore deposition was analyzed critically by Professor Vogt in a paper running through three issues of *Economic Geology* for 1926. The contribution explores a field that has attracted much attention from students of economic geology, especially in late years, for it can be said that the agency of igneous rocks in the formation of valuable bodies of both non-metallic and metallic minerals occupies a more prominent place in the study than ever before. The paper was perhaps the outstanding single work of the year in this department, but its bearings are too broad to be set forth clearly within a limited space.

**GLACIAL CLIMATE.** As the primary cause of climatic changes, as exemplified by the recurrence of glacial conditions on the earth, Professor Scott (Presidential Address before Geological Society of America) finds the only adequate agency in the sun. Purely terrestrial influences, like those arising from variations of continental elevation and form, deflection of the ocean currents, atmospheric variations and shifting of the earth's axis, are inadequate by themselves to account for all the conditions involved in widespread glaciation. Sun spots and variation of solar radiation exercise a direct influence upon terrestrial weather and one that differs with the various zones. Their effects may be described as cyclic, rather than as trending uniformly in one direction. Modifications of topography by mountain folding and regional uplift and subsidence are subordinate influences that may bring about changes of temperature and precipitation; it can not be shown, however, that such modifications have accompanied all the revolutionary climatic changes which the earth has undergone or that they are a sufficient condition for them.

**GEORGETOWN UNIVERSITY.** A Roman Catholic institution of higher education at Washington, D. C.; founded in 1789. In the fall term of 1926 there were 2351 students enrolled, with a distribution as follows: Arts and sciences,

889; medical, 344; dental, 128; law, 489; foreign service, 501. The faculty numbered about 350. The Riggs Memorial Library contained 161,247 volumes, and the First Library 12,548. There are also individual libraries maintained by the professional schools. During the year a dormitory accommodating 244 students was completed, and an addition to the University Hospital begun. President, the Rev. Charles W. Lyons, S. J.

**GEORGE WASHINGTON UNIVERSITY.** A coeducational institution of higher education at Washington, D. C.; founded in 1821. The enrollment for the year 1926-27 was 4932, divided as follows: Graduate School, 316; Columbian College, 2520; engineering, 477; Teachers College, 567; medical, 300; law, 714; pharmacy, 38. The summer session had an enrollment of 1542. The faculty numbered 408. The endowment funds amounted to \$855,868.73, from which the income for the year was \$34,438.01. The total income from all sources was \$810,102.33. The number of volumes in the general library was 65,000, in the Law School library, 11,000, and in the Medical School library, 2,000. Plans were rapidly progressing at the end of the year for the immediate construction of unit three of the new university plant, to include quarters for the general library. President, William Mather Lewis, M.A., LL.D.

**GEORGIA. POPULATION.** According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 2,895,832. The estimated population on July 1, 1926, was 3,139,000. The capital is Atlanta.

**AGRICULTURE.** The following table gives the acreage, production and value of the principal crops, in 1925 and 1926:

Crop	Year	Acreage	Prod. bu.	Value
Cotton	1926	4,029,000	1,475,000 <sup>a</sup>	\$81,862,000
	1925	3,589,000	1,164,000 <sup>a</sup>	110,569,000
	1926	3,817,000	55,346,000	42,603,000
Corn	1925	3,895,000	41,676,000	41,676,000
	1926	496,000	11,408,000	7,872,000
Oats	1925	413,000	7,021,000	6,108,000
	1926	540,000	414,000 <sup>b</sup>	7,889,000
Hay	1925	518,000	175,000 <sup>b</sup>	3,648,000
	1926	211,000	110,775,000 <sup>c</sup>	5,871,000
Peanuts	1925	278,000	139,000,000 <sup>c</sup>	4,726,000
	1926	51,900	39,963,000 <sup>c</sup>	9,591,000
Tobacco	1925	67,000	48,240,000 <sup>c</sup>	7,236,000
	1926	19,000	1,197,000	2,274,000
Potatoes	1925	17,000	833,000	1,749,000
Sweet potatoes	1926	110,000	9,460,000	7,568,000
	1925	110,000	5,170,000	6,462,000
Wheat	1926	114,000	1,710,000	2,565,000
	1925	99,000	1,040,000	1,893,000
Peaches	1926	.....	9,400,000	6,920,000
	1925	.....	7,304,000	10,226,000

<sup>a</sup> bales, <sup>b</sup> tons, <sup>c</sup> pounds.

**MINERAL PRODUCTION.** The value of the State's mineral products in 1924 was \$14,946,610, as against \$14,300,313 in 1923. Clay products, the largest component in these totals, attained a value of \$6,032,950 in 1924 and of \$5,739,128 in 1923. Stone was produced in 1924 in total quantity of 565,630 short tons, and in 1923, of 563,910 short tons; in value, \$4,472,628 in 1924 and \$3,942,294 in 1923. Barytes continued an important product, attaining a quantity in 1924 of 71,776 short tons, as against 83,201 short tons in 1923; valued at \$574,208 in 1924 and \$670,343 in 1923. Coal production was 74,947 short tons in 1924, and 75,620 short tons in 1923; in value, \$271,000 in 1924 and \$327,000

in 1923. Manganese and manganiferous ores, sand and gravel, iron ore and bauxite were the other chief mineral products.

The value of gold produced in Georgia during the period 1830 to 1925 was \$17,840,057, or more than one-third of the estimated total output of the Southern Appalachian States, according to the Bureau of Mines.

In 1925 four deep mines and one placer mine produced \$9683 in gold and 46 ounces of silver. The production of gold in 1924 amounted to only \$655.

**FINANCE.** As summarized by the United States Department of Commerce, payments for the maintenance and operation of the general departments of the State for the fiscal year ending Dec. 30, 1925, were \$14,296,549. Their rate per capita was \$4.67, as against \$4.73 in 1924 and \$2.48 in 1917. Their total included \$4,715,423 for education, apportioned to minor State divisions. Expenses totaling \$236,094 for interest on debt and \$6,728,124 for permanent improvements, added to the payments for maintenance and operation of the State departments, made the total of State payments \$21,260,767. For highways was expended the sum of \$8,155,642, of which \$1,850,014 was for maintenance and \$6,305,628 for construction.

Revenue receipts of the State were \$22,524,924, or \$7.37 per capita. They exceeded by \$7,992,281 the total payments except those for permanent improvements, and furthermore exceeded by \$1,264,157 the total with these included. Property and special taxes formed 30 per cent of the revenue in 1925, as against 32.3 per cent in 1924 and 68.8 per cent in 1917. Their per capita rate was \$2.21 in 1925, \$2.16 in 1924 and \$1.93 in 1917. Earnings of the general departments and compensation for officials' services furnished 9.5 per cent of the 1925 revenue; business and non-business licenses, 35.9 per cent. License receipts were derived chiefly from taxes on incorporated companies and on sales of gasoline, and from licenses for automobiles.

The net indebtedness of the State on Dec. 31, 1925, was \$5,632,702, or \$1.84 per capita, as against \$2.07 per capita in 1924 and \$2.14 in 1917. The assessed valuation of property subject to State tax was \$1,240,848,262. The State tax levy was \$0.204,241, or \$2.03 per capita.

**TRANSPORTATION.** The total mileage of railroad line in operation at the end of 1925 was 6,979.40, switching and terminal companies excluded. New construction in 1926 was less than 2 miles of second track. Some 20 miles of line of the Waycross and Western railroad between Waycross and Cogdell was abandoned.

**EDUCATION.** The equalization of educational opportunities among pupils of the common schools in counties of the State, differently circumstanced in respect of financial means, was provided for by a bill to authorize the Legislature to make extra appropriation to the school fund for distribution where required to this end. This bill was passed by the extra session of the Legislature, in the spring of 1926. Three previously voted amendments to the State constitution with a bearing on education were ratified by popular vote. Of these one empowered the Governor to borrow up to \$3,000,000, as against a former limit of \$500,000, for the purpose of making prompt payment to school teachers, of salaries when due. It was provided

that interest on such a loan should be met from the funds of the State and not from the school fund. A second amendment authorized collection of vital statistics. A third empowered the board of education of Fulton County to levy an extra county-wide tax for the purpose of keeping the county's rural schools in session for a full period of nine months. It was proposed that the Legislature at its 1927 session should consider an appropriation of \$1,000,000 to a rural school fund. The Georgia Education Association attained in April, according to the *Journal of the National Education Association*, a membership of 8600.

The school population of the State in 1924, the latest year for which official figures were available, numbered 900,352. Total enrollment was 703,570, of which enrollment in common schools composed 639,591 and that in high schools 63,979. Expenditure for education in public schools in 1924 attained \$17,356,210; that for higher education was \$5,345,762; the total of the two branches, \$22,710,973. Salaries of white teachers in the schools averaged \$97.88 a month; those of colored teachers, \$49.41 a month.

**CHARITIES AND CORRECTIONS.** The chief among the State charitable and correctional institutions in 1926 were the State Training School for Boys, Confederate Soldiers' Home, State Sanitarium, Training School for Mental Defectives, Academy for the Blind, School for the Deaf and State Tuberculosis Sanitarium.

**LEGISLATION.** A special session of the Legislature held in the spring enacted important educational measures. See *Education*, above.

**POLITICAL AND OTHER EVENTS.** At the general election on November 2, United States Senator Walter F. George was reelected without opposition, and the entire Democratic ticket was elected, including Dr. L. C. Hardman, the candidate for Governor. Fort Land was elected Superintendent of Education.

The suspension of the Bankers' Trust Company of Atlanta on July 14 occasioned suspensions of numerous small banks chiefly in Georgia and some in Florida, in the latter part of July, some 117 banks in all ceasing payments. T. R. Bennett, State superintendent of banks, resigned October 15. The chief political contest of the year was that at the Democratic primary election, between Dr. L. G. Hardman and John Holder for the governorship nomination. A runoff primary was required to decide the nomination, and was held October 6, Hardman winning. The Ku Klux Klan influence in the State was reported as favoring his opponent. The Atlanta Board of Education tabled a report on the teaching of the evolution of man in the public schools, May 12. An extensive merger of electric power companies in the State was voted by stockholders at Atlanta December 15, to include the Georgia Railway and Power Co., and the Georgia Railway and Electric, the Georgia Power, The Athens Railway and Electric, the Rome Railway and Light and the East Georgia Power companies. The first and second units of the Bartlett's Ferry hydroelectric power project in West Georgia, fed by the 6000 acre lake created by the Bartlett's Ferry dam and known as Lake Harding, were put in operation by the Columbus Electric and Power Company early in the year.

**OFFICERS.** Governor, Clifford Walker; Secretary of State, S. G. McLendon; Attorney-General, George M. Napier; Treasurer, W. J.

Speer; Auditor, S. J. State; Comptroller-General, W. A. Wright; Superintendent of Education, N. H. Ballard; Commissioner of Agriculture, J. J. Brown; Commissioner of Commerce and Labor, H. M. Stanley.

**JUDICIARY.** Supreme Court: Chief Justice, Richard B. Russell; Associate Justices, Marcus W. Beck, Samuel C. Atkinson, H. Warner Hill, S. Price Gilbert, James K. Hines.

**GEORGIA (GEORGIAN SOCIALIST SOVIET REPUBLIC).** One of the three Transcaucasian republics that emerged after the Russian Revolution of 1917. After 1918 it was an independent republic; since 1921 it has been known as the Georgian Socialist Soviet Republic, and with Armenia and Azerbaijan, forms the Transcaucasian Federal Republic which is affiliated with the Union of Soviet Socialist Republics (See RUSSIA). Georgia is situated in Transcaucasia between the Black and Caspian Seas and is bounded on the north by the Caucasus, on the east by the republic of Azerbaijan, and on the south and southwest by Armenia and Turkish territory. Capital, Tiflis. Area, 25,760 square miles; population, according to the census of 1920, 2,372,403. The chief cities with their latest available populations are: Tiflis, 246,766; Kutais, 85,151; Sukhum, 61,974; and Poti, 20,741. At the end of 1923 there were 1788 schools with 195,799 pupils. The chief pursuit is agriculture, which engages about 90 per cent of the people. The methods are very primitive. The large estates have been divided among the peasants, the minimum allowance for any one family being about 17 acres. The chief product is corn, but vine-growing is carried on extensively, and the country is also rich in fruits. Silk production and bee-keeping are long established activities. There are about 12,000,000 domestic animals, and the country has vast possibilities for cattle-breeding. The chief mineral production is that of manganese, around Tchiaturi, where the greatest deposits of this mineral in the world are found. Other mineral products are naphtha, coal, copper ore, lead, and iron ore. All the basic industries were nationalized by the Soviet régime. The railways of the republic, which are all state-owned, total 970 miles. During 1926 a line from Akhal-Senaki along the Black Sea coast, through Sukhum to Tuapse, was being constructed.

**GEORGIA SCHOOL OF TECHNOLOGY.** A State Institution of higher education at Atlanta, Ga.; founded in 1888. For the autumn of 1926 the total number of collegiate day students was 2005. The registration for the summer school of the year was 473. The number of members of the faculty in the fall of 1926 was 143. The endowment of the institution amounted to \$200,000, and the income from appropriations and fees was \$423,000. During the year a new dormitory, the N. E. Harris Hall, was constructed at a cost of \$85,000. The library contained 17,950 volumes. President, Marion Luther Brittain, LL.D.

**GEORGIA, UNIVERSITY OF.** A State institution of higher education at Athens, Ga.; founded in 1801. In the autumn of 1926 there were 1521 students, an increase of 120 over 1925. The summer session was attended by 2150 students. The faculty numbered 91. The productive funds of the university amounted to \$425,000, and the income for the year from the State and other sources was \$275,000. The library contained 59,000 volumes. During the year several

small buildings were erected and the athletic building was completed, the total building expenditure for the year being about \$30,000. Chancellor, Charles M. Snelling, Sc.D.

**GERMAN COLONIES.** During the World War all the overseas possessions of Germany in Africa, the Pacific Ocean, and the Far East were captured by the Allies. In Africa they included German East Africa, German Southwest Africa, Kamerun, and Togo. All of these were divided between Great Britain and France, Southwest Africa being annexed to the Union of South Africa. In the Pacific were New Guinea, including Kaiser Wilhelm's Land, Bismarck Archipelago, German Solomon Islands, Nauru, Caroline Islands, Marshall Islands, Marianne or Ladrone Islands (with the exception of Guam), and German Samoa. In the Far East there was only the German possession of Kiaochow. The total area of the German colonies was estimated at 1,140,117 square miles and the total population was estimated at 13,258,000. See principal titles mentioned above and TANGANYIKA TERRITORY, and KENYA COLONY.

**GERMAN EAST AFRICA.** A former German colony, now administered by Belgium and Great Britain. It is located on the coast of Africa and extends from the Indian Ocean to Lakes Victoria Nyanza, Tanganyika, and Nyassa, lying to the south of Kenya Colony and Protectorate. After the War it passed under the control of Great Britain and Belgium under mandates of the League of Nations. The Belgium share included the province of Ruranda Urundi, which is administered by a royal commissioner of the Belgian government with headquarters at Kigali. The British portion is known as Tanganyika Territory (q.v.).

**GERMAN EVANGELICAL SYNOD OF NORTH AMERICA.** See EVANGELICAL SYNOD OF NORTH AMERICA.

**GERMAN LITERATURE.** When shortly after the establishment of the German Republic the young generation of her poets burst into song, not a few critics hailed them as voices of a new era, announcing the birth of a new German conscience. Franz Werfel's rhapsodic verse, published a few years before, had already struck a new note. The works of Fritz von Unruh, the plays of Georg Kaiser, who after previous tentative efforts seemed to have found himself during the great crisis, and those of the young revolutionary, Ernst Toller, were indeed teeming with a new spirit. One had reason to look forward with great expectation to the further development of that interesting group.

On looking backward to see whether they have fulfilled the promises of their auspicious débuts, even enthusiastic compatriots and admirers of those writers admit a slight disappointment. There is no doubt that Franz Werfel is the only one who has pursued a steadily upward course. His ability to turn from his early symbolical plays with their more or less radical tendency to historical drama, commands respect. Fritz von Unruh, Ernst Toller and even Georg Kaiser, who a few years before had threatened to revolutionize playwriting by his "expressionism," have produced nothing recently that can compare with their earlier work. Thoughtful critics consider expressionism a thing of the past. Thus the great upheaval in Germany has not produced equally great results in the country's literature.

**FICTION.** The year passed without any out-

standing event in the realm of fiction, although the production was enormous and represented both the older and the younger generation. Hermann Sudermann's story of the Bismarck period, *Der Tolle Professor*, and Gustav Frenssen's *Otto Buchenick* attracted little attention. Jacob Wassermann's latest work, *Aufbruch um den Junker Ernst*, proved his increasing inability to correlate matter and manner. Thomas Mann did not add to his reputation by his *Kino* and the autobiographical *Unordnung und frühes Leid*; neither did his more interesting, although less popular brother, Heinrich Mann, whose novel *Kobes* and short stories, entitled *Liliane und Paul*, lack some of his previous power. The Alsatian René Schickele published a story with the suggestive title *Der Erbe am Rhein*, Ernst Zahn, the Swiss novelist, a novel, *Die Hochzeit des Gaudenz Orell*, and short stories entitled *Schritte ins Dunkel*, Jacob Schaffner, another gifted Swiss, short stories called *Der Kreiselspieler*, Georg Ompfeda, the psychologist of German aristocracy, a story about a minor sovereign, *Ernst III*, Ernst von Wolzogen a novel of contemporary Germany, *Das Schlachtfeld der Heilande*, Wilhelm Hegeler a problem novel, *Die zwei Frauen des Valentin Key*, Max Dreyer, once prominent as playwright, the novels *Der siegende Wald* and *Das Riesenspielfeug*, Otto Ernst, poet, playwright and novelist, *Buzi, oder Morgenstunden einer Menschenseele*, Emil Strauss a story called *Kreuzungen*, Bernhard Kellermann the novel *Die Brüder Schellenberg*, Heinrich Lilienfein stories about poets, *Aus Weimar und Schwaben*, Walter von Molo a story with the poetic title *Im ewigen Licht* and Walter Bloem another patriotic novel, *Teutonen*.

All these books cover the whole gamut from pathos to humor. Little masterpieces of the latter are *Von Genies und Kameelen* by Alexander Moszkowski, the brother of the musician Moritz, and *Goldmachergeschichten* by Gustav Meyrinck, whose contributions to *Simplitissimus* have been a feature of that delectable magazine. A unique book is Theodore Lessing's *Meine Thiere*, animal stories full of spiritual and philosophical truths. Stefan Zweig, the champion and translator of Romain Rolland and other French writers, sponsors the novel *Sieg des Lebens*, by Ulrich Ebermayer, for its uplifting tendency. Arnold Ulitz's latest works, *Christine Munk* and *Barbaren*, do not reach the dramatic power of his story of the Russian debacle, *Ararat*. Lion Feuchtwanger is not likely to equal the success of his *Jud Suss* by his latest novel, *Die hassliche Herzogin Margarethe Maultasch*. Hans Franck's *Minnermann* is a well-balanced story of an upstart of the war period. Leonhard Frank, once acclaimed by the Socialists, has incurred their displeasure by his new stories *An der Landstrasse*. Hans Friedrich Blunck's *Kampf der Gestrirne* traces the first dawn of the God-idea in the human soul. Hermann Heinrich's *Dome ins Feuer*, the evolution of a German into a European mind. Frank Thies's *Narren* ably deals with problems of dementia.

The number of women novelists is great. Prominent among them by her erudition and distinction is Ricarda Huch, who proves her ability to strike a lighter vein in her grotesque story, *Der wiederkehrende Christus*. Clara Viebig's new book of short stories is entitled *Aus der Franzosenzeit*, Goethe's youthful love for Friederike Brion is retold by Anselma Heine in *Der*

*Zwoergenring*, while Marie Schneider deals with the tragedy of *Hölderlin*. Country life and types are treated by Marie Diers in *Der Jüngste Tag im Willebocker Moor*, Lisbeth Dill in *Der Grenzpfahl*, Paula Grogger in *Grimmingsdor*. Annette Kolb, who created a sensation in war-time by her refusal to join the ultra-patriots, calls her latest book *Spitzbögen*. The dean of German women writers, Marie Eugénie delle Grazie, poet, playwright and novelist, added to her long list of works *Die weissen Schmetterlinge von Clairvaux* and *Unsichtbare Strasse*.

DRAMA. Compared with the output of fiction, that of drama was very small. Nor can any one of the new plays be considered an important dramatic event. Even Gerhart Hauptmann's new play, *Dorothea Angermann*, in which he returns to his earlier manner, is inferior in content and construction to his previous work. Arthur Schnitzler's drama in verse, *Der Gang zum Weiher*, does not reach the effectiveness of his prose plays. Hugo von Hofmannsthal maintains an even standard of formal excellence and invests the story of a parricide on a fictitious Polish throne in *Der Turm* with dramatic life and poetic beauty. Karl Schönherr's latest, *Der Armendoktor*, has the "hunger blockade" of the war as background. Hermann Bahr's *Altweibersommer* is an amusing farce. Hans Müller has appeared with a problem play, *Veronica*. Hans von Wolzogen, the indefatigable champion of Wagner, has written a poetical drama, *Longinus*. Herbert Eulenberg has produced an effective farce in *Wie man's macht ist's richtig* and some less effective parodies, *Gegen Shaw*. German history furnishes the plots of Ludwig Berger's *Kronprinzessin Luise*, Herman Hirschberg's *Die deutsche Tragödie oder Bismarck und Wilhelm II.* and Leo Weismantel's patriotic dramas.

Danish history is revived in Hans Franck's *Kanzler und König*. Greek mythology in Hans Henny Jahnn's sex drama, *Medea*. Kurt Goebel's *Leute von da drüben* was praised for its delineation of characters. Paul Faesi, a Swiss writer, roused genuine interest by his play in the form of an old mystery, *Das Opferspiel*, remarkable for its spiritual content. Paul Zech failed to make Arthur Rimbaud convincing as hero of *Das trunkschiff*. Ernst Toller disappointed even his admirers by his comedy of a barber, *Der Entfesselte Wotan*, and the same can be said of Carl Sternheim's society satire *Die Schule von Uznach* and of Georg Kaiser's *Zweimal Oliver*. Franz Werfel alone seems to have produced a noteworthy work in his dramatic legend *Paulus unter den Juden*.

POETRY. Poetry is at rather low ebb in contemporary Germany. Heinrich Vierordt has sent out his collected verse, *Gedichte*, Max Bruns a book suggesting Persian influence, *Garten der Ghaselan*, Hans Brandenburg a book of sonnets, and Margarete Bruns, poems called *In sinkender Sonne*. Irene Forbes-Mosse has also published a new volume of her poems, *Gedichte*. Alfred Kerr, the distinguished critic, has suddenly appeared as the author of a volume of verse, *Capriccios*. Ernst Lissauer, of *Hymn to Hate* fame, has turned to a more normal source of inspiration in *Die ewigen Pfingsten*. Rudolf Leonhard's *Das nackte Leben* suggests the social problem. Felix Stenglin has written *Das Wartburglied* and Johannes Becher, one of the most forceful poets of the young generation, boldly calls his latest book *Maschinenrhythmus*.

LITERATURE, CRITICISM, ETC. Among the numerous books on literary subjects the most important dealing with German letters are Friedrich von der Leyen's *Geschichte der deutschen Literatur*, Oskar Walzel's *Deutsche Dichtung der Gegenwart*, and Albert Soergel's work on the same period. Noteworthy are Hanns Martin Elster's *Das Pantheon* and Hans Rohl's *Geschichte der deutschen Dichtung*. Goethe bibliography has been increased by Franz Koch's *Goethe und Platin*. Julius Bab's *Faust* and Konrad Burdach's *Vorspiel*. Heine is dealt with in a book by Hermann Wendell and in H. W. Houben's *Gespräche mit Heine*. Karl Justus Obenauer's *Hölderlin* and *Novalis* rank high among the works of the younger critics. Ernst Heilborn's *E. T. A. Hoffmann*, Richard Schaukal's *Adalbert Stifter*, Wilhelm Hess's *Wilhelm Raabe*, Wilhelm Michel's *Martin Buber*, Arthur Elowsky's *Thomas Mann* and Richard Specht's *Franz Werfel* prove the German writers' commendable quality of appreciating one another during their life-time. This appreciation sometimes takes the form of a symposium as in the volume on *Wilhelm Schmidbott*, poet, playwright and novelist, in which Stefan Zweig and other well-known writers are represented. A more ambitious book of this kind is *Liber Amicorum*, in honor of Romain Rolland's sixtieth birthday, which contains contributions from Georg Brandes, George Duhamel, Maxim Gorki, Jane Addams, Stefan Zweig and many others.

Anton Bettelheim is the author of a new study of Balzac, Alfred Klaar of Spinoza, August Vetter of Nietzsche, Julius Meyer-Graefe of Dosztojewski als Dichter, Julius Bab of Bernard Shaw and Carl Hagemann of Oscar Wilde. Meyer-Rotermund's *Des Jahrhunderts verlorene Kinder* contains a well-deserved appreciation of Johannes Schlaf, who with Arno Holz founded the German naturalistic school, but seems to be forgotten by the younger generation. Other publications are Julius Bab's *Shakespeareköpfe*, Alfred Dove's selected *Essays*, Julius Polgar's *Ja und Nein*, an analysis of criticism, Oscar Walzel's *Das Wortkunstwerk*, Otto Forst-Battaglio's *Die französische Literatur der Gegenwart*, Ernst Robert Curtius's book on the influence of the French spirit in modern Europe, M. L. Wagner's rather incomplete history of Spanish literature, Johannes Geffcken's Greek literature from the beginnings to the Sophists, Max Grube's history of the Meininger theatre, Herbert Thering's *Aktuelle Dramaturgie* and Thomas Mann's account of the origin of his *Buddenbrooks*.

BIOGRAPHY, LETTERS, MEMOIRS. The first authoritative work on *Julius Langbehn*, who had created a sensation some thirty-five years previously with *Rembrandt als Erzieher* was written by his friend Benedikt Momme Nissen. Reminiscences came from the pens of Alexander von Gleichen-Russwurm, Anselma Heine and Hermann Schlittgen. Hermann Bahr's *Die Liebe der Lebenden* is an autobiographical diary, covering only a few years. O. A. K. Schmitz's *Dämon Kienel*, the composer, has also published his autobiography. Adolf Haller and Max Konzelmann have written lives of *Pestalozzi*, Emil Königer of St. Francis of Assisi, entitled *Bruder Franz*, Helene Raff of her father Joachim Raff, the composer, and Marie von Bülow of her husband, *Hans von Bülow*. Helene Christaller's diary of *Annette von Broste-Hülshof*, Germany's

greatest poetess, is exceptionally interesting. *Im Anfang war die Liebe* is the title of a volume of Letters by Malvida von Meynsburg to her foster-daughter, Mme. Gabriel Monod, the daughter of a Russian author, Alexanzen. Hermann Pies has compiled a new volume of documents on *Caspar Hauser*. Hermann Imre is the author of a psychoanalytic study of the philosopher *Georg Theodor Fechner*. The letters of *Georg Nebuhr*, the historian, *Mörcke*, *Vischer*, *Karl Rosenkranz* and *Varnhagen von Ense* and two volumes of *Walter Rathenau's* correspondence have recently appeared.

MISCELLANEOUS. Among the books of history are Hans von Helmolt's *Friedrich der Grosse und sein Preussen*, Herman Oncken's *Napoleon und der Rhein*, and Friedrich Raimund Kaindl's *Oesterreich, Preussen, Deutschland*. Historical monographs are Günther Probst's *Die Stadt Wien* and Eugen Kalkschmidt's *Das alte Dresden*. Karl Alexander Müller published *Deutsche Geschichte und deutscher Charakter*, Carl Sternheim *Lutetia*, a review of European politics, economics and art, and Johannes Schlaf deals in his *Deutschland* with the future of his country. Books on Asia are Hans Rohde's *Kampf um Ostasien und den stillen Ozean*, Friedrich Rosen's *Persien*, Richard Wilhelm's *Die Seele Chinas*, Walter Hagemann's *Das erwachende Asien*, and India is the background of Hans Prager's *Gandhi* and Kurt Walter Goldschmidt's *Buddha und Dionysius*. Konrad Burdach writes on *Reformation, Renaissance und Humanismus*, Robert Saitschik on *Menschen und Kunst der italienischen Renaissance*, Franz Helbing's *Die Tortur* is a history of torture and Emil Lucka's *Torquemada* deals with the Spanish inquisition. Thassilo von Scheffer has compiled a volume of *Römische Götter- und Heldensagen* and Ernst Barthel writes on *Die Philosophie des Eros*. Ernst von Sydow's *Kunst und Religion der Naturvölker*, Alfred Biese's *Das Naturgefühl im Wandel der Zeiten* and Wilhelm Bilsche's book on the struggle with the unknown in nature, *Von Drachen und Zauberkünsten*, are unusually interesting. P. Th. Hofmann has compiled an anthology of religious sentiment, *Das Göttliche*, and Martin Rade's *Glaubenslehre Christus* and Gustav Schüler's *Von Stundenleid und Ewigkeit* also deal with spiritual values.

The growing trend towards mysticism is evident from August Friedrich Ludwig's *Geschichte der okkultistischen Forschung*, Rudolf Otto's *Westöstliche Mystik*, Friedrich Klein's *An der Schwelle des vierdimensionalen Zeitalters*, Rudolph Kienast's work on Rosicrucian writings, Max Kemmerich's *Das Weltbild der Mystik*, Grete Luers's *Die Sprache der deutschen Mystik des Mittelalters im Werke der Mechtild von Magdeburg* and Friedrich Strunz's *Albertus Magnus*. Hermann Keyserling published *Menschen als Sinnbilder* and *Die neuentstandene Welt*, Ernst Kraecke a book on comparative pedagogy, *Menschenbildung*, Richard Müller-Freinfels pleads for appreciation of art in *Erziehung zur Kunst*, Heinrich Spiess tries to further an understanding of England by *Kultur und Sprache im neuen England*, Victor Klemperer writes on *Romanische Sondersart* and Heinrich Kautz interprets the soul of industrialism in *Im Schatten der Schlöte*. Hermann Scheffauer continues his questionable interpretations of America in *Das geistige Amerika*. The most interesting volume of essays has come from Alfred

*Polgar: An den Rand geschrieben.* Among books of travel is Josef Ponten's *Die Iugenesische Landschaft*. Among works on art are Hugo Kehler's *Spanische Kunst von Greco zu Goya*, Carl Becker's *Die Malerei des 19. Jahrhunderts*, Dr. Albert Einstein's *Die Kunst des 20. Jahrhunderts*, Alexander Koch's *1000 Ideen*, a book on interior decoration, Dr. Wilhelm Lotz's *Gold und Silber*, and F. Perzynski's *Japanische Masken*. Music is represented by Ernst Bucken's *Musikalische Charakterköpfe* and Franz Habock's *Die Kastraten und ihre Gesangkunst*. Translations from the Scandinavian languages, Hungarian, Russian, Polish, Italian, French, English, etc., are numerous. Among the American authors thus honored are Upton Sinclair and Sherwood Anderson.

**NECROLOGY.** Among the writers who died during the year were Hans Benzmann, poet, critic and editor of a dictionary of German poets, died January 7, Otto Ernst, dramatist, novelist and critic, died March 5, August Sperl, novelist, died April 7, Wilhelm Sudel, translator of French authors, died April 20, Friedrich Klugs, philologist, died May 21, Arthur Fürst, author of technological works, died May 13, and Richard Sternfeld, author of books on Beethoven and Wagner, died June 21.

**GERMAN NEW GUINEA.** This name was applied to all the German territories in the western Pacific (See GERMAN COLONIES). They were distributed by the Treaty of Versailles as follows: Those north of the Equator, viz., the Caroline, Marshall, Pelew, and Ladrone Islands, to Japan, under mandate; those south of the Equator, viz., the Bismarck Archipelago, the German Solomon Islands, former German possessions on the island of New Guinea, to Australia, under mandate of the League of Nations. All German possessions grouped under the name of German New Guinea were formerly administered from Rabaul, the capital, in the north-eastern part of New Guinea.

**GERMANY.** A federal republic of Central Europe, constituted after the abdication of Emperor William on Nov. 9, 1918; and organized under the constitution of July 31, 1919, by the National Assembly at Weimar, elected in January of that year; formerly the German Empire; bounded on the north by the Baltic Sea, Denmark, and the North Sea; on the west by the North Sea, Netherlands, Belgium, Luxemburg, and France; on the east by Austria, Czechoslovakia, and Poland; and on the south by Switzerland, Austria, and Czechoslovakia. The German Empire consisted of 25 Federal States and the Imperial Reichsland; the Federal Republic consists of 18 republics. Capital, Berlin.

**AREA AND POPULATION.** At the census of Oct. 8, 1919, the area of the republic, including the Saar Valley, was 182,213 square miles and the population, 59,852,682, of whom 28,496,419 were males and 31,356,263 females. The accompanying table from the *Statesman's Year Book* for 1926, gives area and population according to that census, as revised down to June 16, 1925:

	Area English sq. miles	Population June 16, 1925	Pop. per sq. mile 1925
Prussia *	113,256	36,181,043	337
Bavaria * (with Coburg)	29,343	7,899,609	252
Württemberg	7,532	2,594,283	344
Baden	5,819	2,327,086	400

	Area English sq. miles	Population June 16, 1925	Pop. per sq. mile 1925
Saxony	5,789	4,973,519	859
Mecklenburg-Schwerin	5,082	687,899	135
Thuringia	4,527	1,628,533	360
Hesse	2,970	1,358,719	457
Oldenburg	2,480	558,539	223
Brunswick	1,418	508,817	358
Mecklenburg-Strelitz	773	112,048	145
Anhalt	888	351,506	396
Lippe	469	166,038	354
Waldeck	407	59,153	145
Schaumburg-Lippe	131	48,659	371
Hamburg	160	1,128,769	7,055
Lübeck	115	127,560	1,109
Bremen	99	333,368	3,367
Total	181,257	62,539,098	345

\* Excluding the Saar.

The losses under the Treaty of Versailles (June 28, 1919) were as follows: (1) Alsace-Lorraine, returned to France, 5604 square miles, with a population of 1,874,014; (2) a part of Eastern Silesia, the larger part of West Prussia, and a part of Upper Silesia (by plebiscite), ceded to Poland, 17,787 square miles with a population of 3,853,354; a part of Upper Silesia, ceded to Czechoslovakia, 110 square miles and 45,396 population; Eupen and Malmedy, to Belgium, 386 square miles and 60,924 population; Memel, to the Allies, 1057 square miles and 140,746 population; Danzig, to the Allies, made a free city, 794 square miles and 330,252 population. Provision was made to determine the status of certain regions by plebiscite: The Saar Basin, area 742 square miles and 652,818 population was to be under the League of Nations for 15 years, then to determine its destiny by plebiscite; Schleswig to decide between Germany and Denmark; regions of the southern part of East Prussia, in West Prussia, and in Upper Silesia. The plebiscite for Schleswig was held in March, 1920, when the northern zone, comprising 1537 square miles and a population of 166,895, decided for Denmark and was ceded to that country. The plebiscite in Upper Silesia, held in March, 1921, gave a majority for Germany, but the territory was divided according to the vote, and 1255 square miles with a population of 891,669, was annexed to Poland.

In 1924 the movement of population was: Births, 1,311,044; deaths, 802,166; marriages, 440,071. In 1925, 62,643 German nationals emigrated from the country, as against 58,328 in 1924. The various occupations represented in these departures were distributed as follows: Agriculture, 12,812; industries, 19,187; commerce and transportation, 8838; domestic service and similar employment, 6863; and the professional class, 2483. Of the 19,187 industrial workers who left, the largest single group comprised mining, metal, and machine workers. Among the more important German states, Prussia contributed 28,714; Bavaria, 7592; Württemberg, 5005; and Saxony, 3694. Most of the emigrants went to the United States and Brazil. The cities with more than 500,000 inhabitants at the census of June 16, 1925, were Berlin (including suburbs), 3,931,071; Hamburg, 1,053,983; Cologne, 693,266; Munich, 671,548; Leipzig, 660,140; Dresden, 608,025; and Breslau, 553,029.

**EDUCATION.** Primary education is free and compulsory throughout Germany between the ages of 6 and 14. The latest educational statistics

are those gathered in the school census of 1922, when there were 52,763 public elementary schools with 146,933 male teachers and 49,013 female teachers and 8,894,486 pupils. There were also 675 private schools of a similar nature with 35,584 pupils. In the same year there were for boys; 515 Gymnasias, with 10,051 teachers and 152,367 pupils; Realgymnasias, 322, with 6078 teachers and 115,615 pupils; Oberrealschulen and Realschulen, 506, with 9404 teachers and 184,175 pupils; for girls, high schools, 824, with 14,852 teachers and 299,285 pupils. There are ten fully equipped technical high schools, with the power of granting degrees. These had 1833 teachers, and 21,817 pupils in 1924. In addition there are veterinary, agricultural, forestry, mining, commercial, economic, science, art, and other special institutions.

The accompanying table from the source mentioned above, shows the number of universities, with the date of founding, and the number of professors, teachers, and students in 1924:

<i>Universities</i>	<i>Professors and Teachers</i>	<i>Students</i>
Berlin (1809) . . . . .	596	9,950
Bonn (1786-1818) . . . . .	233	2,486
Breslau (1702) . . . . .	229	4,153
Cologne (1388-1918) . . . . .	142	4,161
Erlangen (1743) . . . . .	102	1,501
Frankfort (1914) . . . . .	207	2,683
Freiburg (1457) . . . . .	160	2,913
Gießen (1607) . . . . .	158	1,623
Göttingen (1737) . . . . .	208	2,382
Griesswald (1456) . . . . .	130	1,106
Halle (1694) . . . . .	195	2,381
Hamburg (1919) . . . . .	239	2,422
Heidelberg (1385) . . . . .	197	2,319
Jena (1557) . . . . .	179	2,033
Kiel (1665) . . . . .	164	1,724
Königsberg (1514) . . . . .	174	1,739
Leipzig (1409) . . . . .	303	4,578
Marburg (1527) . . . . .	152	2,153
Munich (1472-1826) . . . . .	338	7,231
Münster (1780) . . . . .	141	2,692
Rostock (1419) . . . . .	106	980
Tübingen (1477) . . . . .	136	2,450
Würzburg (1582) . . . . .	124	2,504
Total . . . . .	4,613	68,114

The students were divided among the several faculties as follows: Theology, 3799; Jurisprudence, 29,669; Medicine and Dentistry, 10,540; Philosophy, 9621; Mathematical and Natural Science, 12,360; and Auxiliary Science, 2125.

PRODUCTION, INDUSTRIES, ETC. At the beginning of June, 1925, the soil of Germany was divided as follows: Arable land, 50,829,427 acres; grass, meadows, and pasturage, 19,832,222 acres; vineyards, 200,495 acres. The accompanying table from an English authority shows the area under the principal crops in acres and yields in metric tons (one metric ton equals 2204 pounds) for 1924 and 1925:

	<i>Area (acres)</i>		<i>Produce (metric tons)</i>	
	<i>1924</i>	<i>1925</i>	<i>1924</i>	<i>1925</i>
Wheat	3,666,190	3,748,079	2,427,632	3,217,300
Rye	10,629,559	10,976,708	5,729,868	8,062,900
Barley	3,613,162	3,575,928	2,399,910	2,599,100
Oats	8,814,505	8,624,545	5,654,003	5,584,500
Potatoes	6,904,625	6,988,230	36,402,241	41,918,400
Sugar beets	985,967	995,410	10,266,586	10,325,900
Hay	13,629,005	13,504,231	23,240,700	22,603,300

In 1924 the area devoted to the cultivation of the vine was 185,855 acres and the wine

yield, 39,686,988 gallons; tobacco, 23,817 acres, yield, 21,524,245 kilos; the sugar production in 1924-25 was 1,578,560 metric tons. The live-stock census of Dec. 31, 1925 showed 3,194,820 horses, exclusive of army horses; 17,182,724 cattle; 4,741,897 sheep; 16,159,766 swine; and 3,792,429 goats.

The minerals include coal, lignite, iron ore, zinc ore, lead ore, copper ore, rock salt, and potash. In 1925 the output of coal was 132,729,000 tons; of lignite, 139,790,000 tons; and of coke, 26,810,000 tons. For a discussion of the nonferrous minerals in Germany see the preceding YEAR BOOK.
